This comes up because of a cram done on this executive which states that he could never reconcile the two systems and has had a confusion on them. This definitely must have shown up during his tenure as an executive and it brings to mind right this minute that the prod–org system and the Esto system may never have been pushed in. This executive violated the normal actions of prod–org and org establishment. But this bares the fact that management and orgs may not be pushing either the prod–org system nor the Esto system and this could, in large measure, account for the fact that orgs in some cases became disestablished and ceased to produce and deliver.

The exact goof which this executive made is important to understand — he put the Service Product Officer over the Esto and made the Esto the org officer of the Service Product Officer, and hoped from this that his org would be established. Of course it wouldn't be established at all because a product officer's org officer normally specializes in disestablishment — org officers have tended mainly to tear up the org in

the name of production. That is by our experience. An org having an Esto, recruits up an Esto corps. That is the only thing that will get posts filled and hatted.

These two systems must be represented on any org board. The product officer must be on those org boards, the product officer's org officer must be on those org boards. And the Executive Esto must be on those org boards. Otherwise these systems will continue to be submerged.

I mention this in order to get into action both the prod–org system and the Esto system. They must be called strongly to attention, otherwise they will go on being neglected.

This could be a major downfall of management and orgs if one just ceased to push these two successful points.

Thus I am calling to your attention the fact that you should use these systems so that we can recover this lost tech.

ADMIN KNOW-HOW SERIES 54

THEORY OF BUILDING AN ORGANIZATION

(Originally issued 5 Jan. 83 as LRH Executive Training Instructions.)

Ref: HCO PL 28 July 71 ADMIN KNOW–HOW No. 26

One of the things an executive does is "back off posts" leaving them in the hands of another. An executive is continuously doing this.

An executive can go down the org board or up the org board. Well, one of the ways he goes up the org board is to get a sector functioning, get somebody apprenticed in it and then give him the hat. The executive then backs off this post while still keeping an eye on it.

If an executive doesn't do this, he finds himself lumbered up with so many hats, he doesn't know which way to turn. If he does the selection of personnel to take such a post well, apprentices it well, he will then, when he turns it over, have avoided the risk of going down the org board to take it over again.

That actually is the overall working theory of building an organization.

TARGET SERIES 1

OT ORGS

What it takes to make an org go right is the intelligent assessment of what *really* needs to be done, setting these as targets and then getting them actually fully *DONE*.

We have all the data necessary to make orgs boom.

Therefore we find that when they don't, these faults must be present:

1. Completely unreal analysis of what needs to be done to make things really *go*.

2. Cross orders - juniors setting other targets *across* vital targets.

3. Noncompliance with vital target accomplishment.

4. False reports on actions or false data concerning targets.

5. Failures to doggedly follow through on one action and get it done fully and completely.

6. Distractions leading to any of the above.

MAJOR TARGET

The desirable overall purpose being undertaken. This is highly generalized, such as "to become an auditor."

VITAL TARGET

By definition a VITAL target is something that must be done to operate at all.

Man's worst difficulty is his inability to tell the important from the unimportant. "Every target is the same as every other target" is part of A=A=A.

It takes good sense to be able to survey an area and find out:

1. What MUST be done.

2. What SHOULDN'T be done.

3. What is only desirable to be done.

4. What is trivial.

As man all too easily specializes in stops, he tends to stress what SHOULDN'T be done. While this enters into it, remember that it's a STOP.

STOPS ALL OCCUR BECAUSE OF FAILED PURPOSES.

BEHIND EVERY STOP THERE IS A FAILED PURPOSE.

A stuck picture or a motionless org are similar. Each has behind it a failed purpose.

THERE IS A LAW ABOUT THIS — ALL YOU HAVE TO DO TO RESTORE LIFE AND ACTION IS TO REKINDLE THE FAILED PURPOSE. THE STOPS WILL AT ONCE BLOW.

That law (it comes out of OT VIII materials) is so powerful it would practically revive the dead!

It applies to orgs.

It applies to cities or nations.

When you diverge from a constructive purpose to "stop attacks," the purpose has been abandoned. You get a *stop.* The real way to stop attacks is to widen one's zone of responsibility. And pour the coal on the purpose. Thus all attacks one makes should be in THE DIRECTION OF ENLARGING ONE'S SCOPE AND AUGMENTING BASIC PURPOSE.

Thus, in the case of Scientology orgs, one should attack with the end in view of taking over the whole field of mental healing. If our purpose was this then it had to be this on all dynamics. We only got into trouble by failing to take responsibility for the whole field!

We'll win back by reasserting that responsibility and making it good.

Targets, to that degree, are purposes.

Purposes must be executed. They are something to DO.

OT

Let us look at the definition of OT — cause over thought, life, form, matter, energy, space and time.

As one falls away from that one becomes a SPECTATOR. Then one becomes an effect. Then one is *gone.*

One causes things by *action.* Not by thinking dim thoughts.

One can be doing an IN-basket as simply a spectator.

In the society today *spectatorism* is very common. Magazine writers, reporters, write weird pieces that look at how odd things are. The writer doesn't understand them at all. He just watches them.

Spectatorism is not so low as total effect.

The total effect — no cause — person has mainly a case. He doesn't even *look*.

Thus there is a gradient scale of OT. It's not an absolute. One is as OT as he can CAUSE things.

One of the things to cause is target attainment. When somebody can push through a target to completion, he's to that degree OT.

People who don't push targets are either just spectators or they are total effect.

ORG STATE

An org is somewhere on the OT scale. Any org is. Of any kind.

An org can figure out the vital targets and push them through to completion or it can't.

It's a gradient scale.

An org succeeds or fails to the degree its individual executives and staff members can measure up to the OT formula: Cause.

Scientology orgs must become cause over their environments.

They do this by each executive and each staff member *accomplishing* targets, small and large.

Thus:

a. If the targets of what MUST be done to operate at all are set and

b. Are carried out with no noncompliance and

c. If no false reports are entered into it,

Then:

That org is way high on the OT scale

AND IT WILL CONQUER ITS ENTIRE ENVIRONMENT COMPLETE.

That's really all there is to it.

One way to fail at it is do (a) with things that are so general that they invite no doingness.

Some guys are so bad off they set targets like "move the mountain" and give one and all a big failure. Since there's no way to do it and probably no reason to either. That's an SP target. So what MUST be done means just that. What is vital and necessary. Not what is simply a good idea.

Here's some MUST targets as examples:

A. Get tech delivered 100 percent in the org itself.

B. Get the public aware of its being delivered and wanting it.

C. Get the admin machinery in to get the public in and out.

Or another series:

D. Get 10,000 trained auditors into the org field.

E. Get the public aware of the project and wanting training.

F. Set up terrific 100 percent snap-pop courses to handle the flow.

Or another:

G. Get a £100,000 reserve cushion.

H. Get all Accounts staff and executives checked out on finance policy.

I. Shove the throttle down on promotion.

J. Deliver fantastic service.

K. Get enough tech people in training to handle the flows.

L. Find bigger, poshier quarters to handle the flow *when* it rises.

M. Get all staff onto the OEC to diminish flow line flubs.

You get the idea.

An exec who is just a spectator to his in-basket flow is doing nothing but cultivating dev-t.

You *can* assess the situation.

You can drive targets home to full completion.

Every executive and every staff member is somewhere on the OT scale. And he can rise higher just by setting up the targets and plowing them through to done, done, done.

Yes, it requires ideas. But ideas come from interested looking and sizing it all up before you set the target in the first place.

You can even raise an org by gradients so as not to overwhelm it. Set and *make* small targets. Then bigger and bigger ones.

Well, you get the idea.

It's the ORG's road to OT.

REMIMEO

TARGET SERIES 2
TARGETS, TYPES OF

There are several VALUES of targets. Not all targets are the same value or importance.

There are, in any org, "understood" or continuing targets which came from FOs or PLs and Mission Orders.

PRIMARY TARGETS

There is a group of "understood" targets which, if overlooked, brings about inaction.

The first of these is:

SOMEBODY THERE

Then:

WORTHWHILE PURPOSE

Then:

SOMEBODY TAKING RESPONSIBILITY FOR THE AREA OR ACTION

Then:

FORM OF ORGANIZATION PLANNED WELL

Then:

FORM OF ORGANIZATION HELD OR REESTABLISHED

Then:

ORGANIZATION OPERATING

If we have the above "understood" targets, we can go on BUT IF THESE DROP OUT OR ARE NOT SUBSTITUTED FOR then no matter what targets are set thereafter they will go rickety or fail entirely.

In the above there may be a continual necessity to reassert one or more of the "understood" targets WHILE trying to get further *targets* going.

VITAL TARGETS

Under this heading comes WHAT WE MUST DO TO OPERATE AT ALL.

This requires an inspection of both the area one is operating into and the factors or materiel or organization with which we are operating.

One then finds those points (sometimes WHILE operating) which stop or threaten future successes. And sets the overcoming of the vital ones as targets.

CONDITIONAL TARGETS

It is interesting that one can go into an art-type "perfection" with targets and groom up primary targets *far* beyond the need to accomplish purposes.

You've seen chaps work all their lives to "get rich" or some such thing in order to "tour the world" and never make it. Some other fellow sets "tour the world" and goes directly at it and *does* it. So there is a type of target known as a *conditional* target: If I could just _____ then we could _____ and so accomplish _____. This is all right of course until it gets unreal.

There is a whole class of conditional targets that have no IF in them. These are legitimate targets. They have lots of WILL in them, "We *will* _____ and then _____."

Sometimes sudden "breaks" show up and one must quickly take advantage of them. This is only "good luck." One uses it and replans quickly when it *happens*. One is on shaky ground to count on "good luck" as a solution.

A valid conditional target would be:

"We will go there and see if the area is useful."

All conditional targets are basically actions of gathering data first and if it is okay, then go into action on a vital target and operating target basis.

This could add up like this:

CT 1 — Survey Lower Slobovia to see if it would be a suitable place for an org. This survey done, if it is positive, one then goes into primary targets and operating targets.

The primary targets would be:

Lower Slobovia One: Appoint local Organization Officer here for Lower Slobovia.

Lower Slobovia Two: Form up Lower Slobovian Org. (Personnel)

Lower Slobovia Three: Train up org. (Staff Training Officer)

Lower Slobovia Four: Translate texts. (Translation Section)

Lower Slobovia Five: Finance formation. (Finance Section)

Lower Slobovia Six: Transport LS Org. (Transport Section)

Lower Slobovia Seven: Prepare LS bldg in LS BEFORE ORG ARRIVES. (LS Org Officer)

Thus we would establish Lower Slobovia. AND IT WOULD ALL GO OFF WELL TO THE DEGREE THE PRIMARY TARGETS WERE MADE, DONE, COMPLETED.

Primary target setting on Lower Slobovia would fail if some primary target were omitted in the first place (never set) or if the conditional target findings on LS were a false report.

Thus we are very hot on "false report" and very hot on "noncompliance."

OPERATING TARGETS

An operating target would set the *direction* of advance and qualify it. It normally includes a scheduled TIME by which it has to be complete so as to fit into other targets.

Sometimes the time is set as "BEFORE _____." And there may be no time for the event that it must be done "before." Thus it goes into a rush basis "just in case."

To get all the shoe salesmen in Boston enrolled on a PE Course would be an operating target. This would *then* go into the framework of a *primary* target as to the remaining targets set.

Operating targets often look like "basic purpose." They can come before or after primary targets. But an operating target has its *own* series of primary targets. To enroll all the shoe salesmen you need somebody in charge of it, a PE Supervisor, literature, a handbook for salesmen, etc., etc., which are all set as primary targets.

Sometimes an elaborate operating and primary target series falls apart because there was no conditional target set, i.e., to find out if Boston had any salesmen and *which* types were responsive. You might find the operating target had been set with no inspection.

So, again, we can move backward and find that an operating target needs a conditional target ahead of it — to wit, an inspection.

PRODUCTION TARGETS

Setting quotas, usually against time, are *production* targets.

These often fail because they are unreal or issued for other reasons than production (i.e., propaganda).

As *statistics* most easily reflect production, an org or activity can be so PRODUCTION TARGET conscious that it fails to set conditional, operating or primary targets. When this happens, then production is liable to collapse for lack of planning stated in other types of targets.

Production as the only target type can become so engulfing that conditional targets even when set are utterly neglected. Then operating and primary targets get very unreal and stats go DOWN.

YOU HAVE TO INSPECT AND SURVEY AND GATHER DATA AND SET OPERATING AND PRIMARY TARGETS BEFORE YOU CAN SET PRODUCTION TARGETS.

A normal reason for down statistics on production is the vanishment of primary targets. These go out and nobody notices that this affects production badly. Production depends on other prior targets being kept *in*.

PROGRAMS

Programs are made up of all types of targets coordinated and executed ON TIME.

Programs extend in time and go overdue to the extent the various types of targets are not set or not pushed home or drop out.

Programs fail only because the various types of targets are not executed or are not kept in.

SUMMARY

You can get done almost anything you want to do if types of targets are understood, set with reality, held in or completed.

People whose own purposes have failed often cannot either set or complete targets. The remedy is to rehabilitate their own purposes which then blows off the stops.

People who stop targets actively have failed so badly that they can only think in terms of stops.

This whole subject of targets and purposes is probably a large one. These are just rough notes and the naming of the different types which is itself a considerable advance.

It is of help in grasping what is going on and gets one somewhere.

TARGET SERIES 3

PLANNING AND TARGETS

(There are at this writing three HCO PLs of near date on this subject of targets. The area has never before been examined or written up as a philosophic subject.)

Plans are NOT targets.

All manner of plans can be drawn and can be okayed. But this does not authorize their execution. They are just plans. When and how they will be done and by whom has not been established, scheduled or authorized.

This is why planning sometimes gets a bad name.

You could *plan* to make a million dollars but if when, how and who were not set as targets of different types, it just wouldn't happen.

A brilliant plan is drawn as to *how* to convert Boston Harbor into a fuel tanker area. It could be on drawings with everything perfectly placed. One could even have models of it. Ten years go by and it has not been started much less completed. You have seen such plans. World's fairs are full of them.

One could also have a plan which was targeted — who, when, how — and if the targets were poor or unreal, it would never be completed.

One can also have a plan which had no CONDITIONAL TARGET ahead of it and so no one really wanted it and it served no purpose really. It is unlikely it would ever be finished. Such a thing existed in Corfu. It was a half-completed Greek theater which had just been left that way. No one had asked the inhabitants if they wanted it or if it was needed. So even though *very* well planned and even partially targeted and half-completed, there it is — half-finished. And has remained that way.

A plan, by which is meant the drawing or scale modeling of some area, project or thing, is of course a vital necessity in any construction and construction fails without it. It can even be okayed *as a plan.*

But if it was not the result of findings of a conditional target (a survey of what's needed or feasible) it will be useless or won't fit in. And if no funds are allocated to it and no one is ordered to do it and if no scheduling of doing it exists, then, on each separate count it won't ever be done.

One can define *planning* as the overall target system wherein all targets of all types are set. That would be *complete planning.*

To get a complete plan okayed one would have to show it as:

a. A result of a conditional target (survey of what's wanted and needed),

b. The details of the thing itself, meaning a picture of it or its scope plus the ease or difficulty in doing it and with what persons or materials,

c. Classification of it as vital or simply useful,

d. The primary targets of it showing the organization needed to do it,

e. The operating targets showing its scheduling (even if scheduled not with dates but days or weeks) and dovetailing with other actions,

f. Its cost and whether or not it will pay for itself or can be afforded or how much money it will make.

Complete planning would have to include the targets and the plan of the thing.

Thus, by redefining words and assigning labels to target types we can get a better grip on this.

A *plan* would be the *design* of the thing itself.

Complete planning would be all the targets plus the design.

Thus we see why some things don't come off at all and why they often don't get completed even when planned. The plan is not put forward in its *target* framework and so is unreal or doesn't get done.

Also it's a great way to lose or waste money.

Sometimes a conditional target fails to ask what obstacles or opposition would be encountered or what skills are available and so can go off the rails in that fashion.

The whole subject of plans, targets and target types is new in the realm of analyzed thought.

It is a subject to "get the feel of" and "learn to think concerning" rather than a fully "canned" subject.

But if these points are grasped, then one sees the scope of the subject and can become quite brilliant and achieve things hitherto out of reach or never thought of before.

TARGET SERIES 4

TARGET TYPES

(Note: This is a developing subject, new in philosophy. It is part of the *philosophy* of Scientology.)

You should learn the names and types of targets for quick use and classification of what you are trying to do.

MAJOR TARGET — The broad general ambition, possibly covering a long, only approximated period of time. Such as "To attain greater security" or "To get the org up to 50 staff members."

PRIMARY TARGET — The organizational, personnel, communication-type targets. These have to be kept *in*. These are the terminals and route and havingness and org board-type targets. Example: "To put someone in charge of organizing it and have him set remaining primary targets." Or "To reestablish the original comm system which has dropped out."

CONDITIONAL TARGETS — Those which set up EITHER/OR, to find out data or if a project can be done or where or to whom.

OPERATING TARGETS — Those which lay out directions and actions or a schedule of events or timetable.

PRODUCTION TARGETS — Those which set quantities like statistics.

PROGRAM — The complete or outline of a complete target series containing all types.

While there may be other types of targets, these (more fully described in HCO PLs 14 Jan. 69 I, Target Series 1, OT ORGS; 16 Jan. 69, Target Series 2, TARGETS, TYPES OF; 18 Jan. 69 II, Target Series 3, PLANNING AND TARGETS; and this one, HCO PL 24 Jan. 69) should be studied and every target set should be classed as one or more of the above.

"Complete planning" and "programs" are synonymous at this time and PROGRAMS is the preferred word.

TARGET SERIES 5

PURPOSE AND TARGETS

Out of the data of OT VIII has come some material that cannot be relegated to that level. It is minor to that level but major to our operations.

The reason we are fought, where we are fought, is contained in its major part in purposes.

Purposes often fail and wind up in *stop*.

Stopped purposes can then be dramatized.

In Scientology we use (quite correctly) FREEDOM. While not the most basic purpose, TO BE FREE is a common purpose to all thetans.

This tends to key in (restimulate) in some persons the stop of being free. They themselves wanted to be free. They were stopped, they dramatize the STOP of being free and try then to stop us. We restimulated (keyed in) their own purpose to be free or free others and where we are opposed the person or persons dramatize the stop or disagreement.

Also where we not only restimulate the stop but oppose and deny him *as well,* we get an enemy.

We are then stopping stoppers. While this is necessary to save the day, it is *preventable* if begun early enough.

The psychiatrist is not the only "freedom stopper" we will ever meet. Many people who have been in healing and mental treatment in the times before we came along had only failures. So anything offered to them (including their own) will be looked on as a failure at best or at worst a fraud.

That it really *can* be done in Scientology is not only outside their reality but regenerated the failed purpose they have had to be free and free others and they dramatize STOP.

While this is not the total reason (interrelations also restimulate ethnic values, meaning customs), it is a big reason for dedicated opposition to us.

We restimulate their failed freedom efforts and they dramatize what stopped *them*. So they irrationally seek to stop Scientology.

This would also be true for products of a commercial nature. It is good advertising technology.

Freedom is one of the buttons that gets us forward. It is also the button that restimulates the opposition into efforts to stop us.

In dissemination then to such people, theoretically one need only get them remembering when *they* wanted to be free or free others to blow their stops. But as they may have many crimes now built up on top of it, some may just spin.

But in all discussions with persons opposing Scientology, one should try the approach of getting them to remember their efforts to be free or to free others and let them talk. As you listen you will realize they were without Scientology to help them and they didn't have a chance.

Led in from that point you *may* get a very receptive person.

HCO PL	19 Aug. 71	AKH Series 28 Target Series 8 PROGRAMS, USE OF — HOW TO SAVE USELESS WORK
HCO PL	12 Sept. 59	PROGRAMING

(The data in this issue has been excerpted from CBO 129, WRITING PROJECTS, 9 Aug. 71 as it contains pertinent and valuable data for hatting those engaged in writing programs or projects. Issued as an HCO PL on 30 Dec. 82.)

Some years back, in hatting an Aide, I asked her to visualize a project she had written being read and done at the receipt-point — in other words to assume the viewpoint of the receiver, and to see if she would then do the project.

After a study of this she wrote the following excellent analysis of the action.

"COMPLIANCE REPORT

8 August 1971

Re Hatting Action

Dear Sir,

I reread five of my projects to visualize a project of mine being done and to see if I would do it and could easily do it if I received it.

I then also read some LRH written projects to see the difference and compare.

1. I found I would not do a project or would not be interested in doing it if:

   a. I didn't understand it well at first reading (unclear).

   b. If it was too long and complex and therefore unconfrontable.

   c. If the reality of WHY it was needed and what improvements it would bring to my post or area was not clearly expressed in the INFO or SITUATION of the project. In other words if the purpose of the project wasn't real.

   d. If, just in reading the project, I didn't KNOW what I was supposed to *DO* with it or while it was underway.

2. Then I would have difficulty doing it:

   a. If each target didn't call for an ACTION, a DOINGNESS.

   b. If each target called for more than one action (confusing).

   c. If each target was not specifically directed to or assigned to one person (me) or to somebody else on my orders.

   d. If NO ONE in particular was responsible to get the project done.

   e. If it went in such detail that it didn't give me any leeway to operate in the existing scene and achieve the target, and if I was left without any initiative to do it.

   f. If each target wasn't a START–CHANGE–STOP with a definite time sequence, it would be more difficult to put it in.

From this I get some POSITIVE points to look for when writing a project:

1. Clearly assign project responsibility to one terminal or group of terminals.

2. Make the info and the situation REAL to the person by showing what the existing scene is.

3. Show why the project needs to be done and what it will accomplish, and *sell* it by doing so.

4. Have one ACTION per target and not more than one.

5. Have the time sequence properly indicated and visible in the project and make it a clear start-change-stop cycle.

6. Don't go into too many details. Better even, refer to a PL where details on HOW to do an action are contained.

7. On the other hand, don't assume that the receipt-point knows policy at the fingertip. He most probably doesn't. Don't skip gradients on the receipt-point.

8. Make it very clear as to who does what target.

9. Keep it short and simple, and each target short and words simple.

10. Watch for outpoints.

There are also the regular policies about targets and their types and how they relate, which are observed.

I'm not saying all my projects were bad and not getting done! FEBC projects are a bit too long maybe, but do have lots of doingness in them. One project is too detailed. One project, as you indicated, has good info but is unclear as to who does what.

A good one, which had most points above in, got completed well.

Thank you for the hatting action."

REMIMEO

ADMIN KNOW-HOW SERIES 28
TARGET SERIES 8

PROGRAMS, USE OF
HOW TO SAVE USELESS WORK

Staff time is very often wasted by the failure to use a program-project system.

Example: Dept 4 does a full layout for promo. Then finds it is off-policy and it isn't used. Means wasted work.

Example: Tech Pc Admin is ordered to make a huge board to give pc addresses. After a lot of work it is never used.

WHY? The job never had any part of a program in the first place. It was not part of any general activity. Thus it is not part of a team action.

The correct procedure in ordering staff to ANY project that is going to consume time is to:

1. See if there *is* a situation.
2. Find out its WHY.
3. Get a general program drawn up. Get it approved as a program with who is to do each part.
4. Get the different parts of the program drawn up as a TARGETED project. With who is to do each project. Get these approved.
5. Get the projects executed.
6. Complete *all* the projects.
7. Report the program as done.

This is a correct sequence. To do anything else is to omit steps in the sequence. This gives two outpoints — omitted steps and altered sequence.

Thus when this procedure is shortcut, the whole org can look batty. It can also have its staff frantic and overworked without producing anything.

Usually the product officer draws up a program.

It is vital that he refer to policy to support his program.

The LRH Comm should approve the program as not off-policy.

Division heads usually write up the projects. These are approved by the product officer and then the LRH Comm.

The program is issued as a local ED when approved.

The projects refer by number to the program and are issued separately as local EDs.

Their completion is chased up by the product officer.

The fully completed program is reported to the LRH Comm.

This *looks* like a lot of writing. It *saves* a lot of work.

Programs and projects are easily corrected and brought on-policy. The actual *work* is costly and impossible to correct.

The wise staff member would clamor for this system. Further he would ask, when told to repaint the students, "Where is the program and the project order?" He'd routinely find that he was often doing a job not approved by anyone but his senior. And disapproved of by the rest of the org.

Programs set priorities. They let a staff work as a team. They get the coins of the org correctly invested in needful work.

The Ad Council is a wise Ad Council if it demands the right to pass on all programs originated by its executives before projects are written or work is done.

Needless to say, a program must handle actual situations, the situations which depress production and prosperity.

These are vital steps in running an org or working in it.

Don't run about frantically or sink into apathy. Get your execs and staff program-project conscious, *save* work, get prosperous.

TARGETS AND PRODUCTION

There is a direct coordination between the clarity and doability of the targets of a program and any increase in stats.

If one can write good, simple, doable programs on matters important to get done, they can get done. If the program is cloudy or the targets too general, little comes of it. It does not show up in stats and can even clutter up lines and impede production.

So it is *very* important to an exec and to staffs that the exec be able to write clean, concise programs and staffs to recognize when they are not and plead for correction.

Strategic planning gets bugged most often because middle management does not put it in target form or if they do, put it in such cloudy or general targets it cannot be done and does not achieve the desired result.

Faults in this can cost — factually — millions in unmade income or actual losses and overwork.

But now today *another* factor is entering the scene. The world has gone *computer*.

Computers can keep track of things and operate to catch things which, undone, wreck things.

In a very short while, at this writing, computers will exist at management echelons to keep track of stats, demand programs and keep track of their effectiveness. The computer will be able to detect very early noncompliance both in writing and getting done programs.

Life will be much smoother as debugs will be demanded more quickly and bad targets or line jams or staff overloads will be detected sooner and remedied, resulting in more income, more service and more pay.

But all this will depend on three things:

1. The existence and soundness of the strategic planning and evaluation. (This has never much been in doubt.)

2. The clarity with which planning can be programed. (This is currently not good at all.)

3. The execution of targets called for at various echelons and staff level. (This depends, to a large measure, on 2 above.)

To a computer, which cannot really think, a target is a target. If not done in the expected time, it will squawk. If still not done, it will demand a debug.

The debug will find (a) the organization ordered did not give it to a correct or the right staff member to do, (b) had no one there to do it or (c) the target was simply neglected at staff level or (d) the target was undoable in its existing form. The right one will be found, action will be taken and the overall scene will advance once more.

So it is *very* important, whether one is writing major, minor or mini programs, that they be written absolutely on-policy from here on out.

This starts now, not waiting for computers, as it is valid in its own right and Programs Ops are on the line. With computers there will still be Programs Ops to run them but the precision and speed will increase amazingly.

The organizations in the world are getting bigger. They have to be more efficient to also pay well. And this all comes down to the 1, 2, 3 above.

It is a miserable thing to be hit with a lot of confused, undoable orders. And dangerous to one at staff level for one can be charged with noncompliance when there was really nothing precise to comply with!

So the ability to coordinate programs and write excellent target-policy targets is vital to the ability of all to work.

And when computers get on the job, electronic sparks will be flying all over the place if target policy is not adhered to carefully and precisely.

So this policy is vital, computers or no computers.

OPERATING TARGETS MUST HEREAFTER BE WRITTEN IN SUCH A WAY THAT THEY ARE FINITE AND NOT A GENERALITY SO THEY ARE PRECISELY DOABLE. Targets like “Keep stats rising” or “Be nice to Joe” are not doable targets from a computer’s viewpoint or anybody else’s.

But, computers aside, the one that does the target is NOT a computer and with target clarity can do it far more easily.

Hear me, the 1, 2, 3 above are the make-break point of expand or not expand.

So heed it.

ADMIN KNOW-HOW SERIES 43
TARGET SERIES 10

BATTLE PLANS

A "battle plan" is defined as:

A list of targets for the coming day or week which forward the strategic planning and handle the immediate actions and outnesses which impede it.

Some people write "battle plans" as just a series of actions which they hope to get done in the coming day or week. This is fine and better than nothing and does give some orientation to one's actions. In fact someone who does not do this is quite likely to get far less done and be considerably more harassed and "busy" than one who does. An orderly planning of what one intends to do in the coming day or week and then getting it done is an excellent way to achieve production. But this is using "battle planning" in an irreducible-minimum form as a tool.

Let us take up definitions. Why is this called a "battle plan" in the first place? It seems a very harsh military term to apply to the workaday world of admin. I did not select this term, it sort of grew up by itself amongst Sea Org executives. But it is a very apt term.

A war is something that happens over a long period of time. The fate of everything depends on it. A battle is something which occurs in a short unit of time. One can lose several battles and still win a war. Thus one in essence is talking about short periods of time when one is talking about a battle plan.

This goes further. When one is talking about a war, one is talking about a series of events which will take place over a long period of time. No general, or captain for that matter, ever won a war unless he did some strategic planning. This would concern an overall conduct of a war or a sector of it. This is the big upper-level idea sector. It is posed in high generalities, has definite purposes and applies at the top of the Admin

Scale. (Ref: HCO PL 6 Dec. 70, Personnel Series 13, Org Series 18, THIRD DYNAMIC DE–ABERRATION)

Below strategic planning one has tactical. In order to carry out a strategic plan one must have the plan of movement and actions necessary to carry it out. Tactical planning normally occurs down the org board in an army and is normally used to implement strategic planning. Tactical planning can go down to a point as low as "Private Joe is to keep his machine gun pointed on clump of trees 10 and fire if anything moves in it."

"Middle management" — the heads of regiments right on down to the corporals are covered by this term — is concerned with the implementation of strategic planning.

The upper planning body turns out a strategic plan. Middle management turns this strategic plan into tactical orders. They do this on a long-term basis and a short-term basis. When you get on down to the short-term basis you have battle plans.

A battle plan therefore means turning strategic planning into exact doable targets which are then executed in terms of motion and action for the immediate period being worked on. Thus one gets a situation whereby a good strategic plan, turned into good tactical targets and then executed, results in forward progress. Enough of these sequences carried out successfully gives one the war.

This should give you a grip on what a battle plan really is. It is the list of targets to be executed in the immediate short-term future that will implement and bring into reality some portion of the strategic plan.

One can see then that management is at its best when there is a strategic plan and when it is known at least down to the level of tactical planners. And tactical planners are simply those people putting strategic plans into targets which are then known to and executed from middle management on down. This is very successful management when it is done.

Of course the worthwhileness of any evolution depends on the soundness of the strategic plan.

But the strategic plan is dependent upon programs and projects being written in target form and which are doable within the resources available.

What we speak of as "compliance" is really a done target. The person doing the target might not be aware of the overall strategic plan or how it fits into it, but I assure you that it is very poor management indeed whose targets do not *all* implement to one degree or another the overall strategic plan.

When we speak of coordination (Ref: HCO PL 1 July 82, Admin Know-How Series 41, MANAGEMENT COORDINATION), we are really talking about conceiving or overseeing a strategic plan into the tactical version and at the lower echelon coordinating the actions of those who will do the actual things necessary to carry it out so that they all align in one direction.

All this comes under the heading of *alignment*. As an example, if you put a number of people in a large hall facing in various directions and then suddenly yelled at them to start running, they would, of course, collide with one another and you would have a complete confusion. This is the picture one gets when strategic planning is not turned into smooth tactical planning and is not executed within that framework. These people running in this hall could get very busy, even frantic, and one could say that they were on the job and producing but that would certainly be a very large lie. Their actions are not coordinated. Now if we were to take these same people in the same hall and have them do something useful such as clean up the hall, we are dealing with specific actions of specific individuals having to do with brooms and mops — who gets them, who empties the trash and so forth. The strategic plan of "Get the hall ready for the convention" is turned into a tactical plan which says exactly who does what and where. That would be the tactical plan. The result would be a clean hall ready for the convention.

But "Clean up the hall for the convention" by simple inspection can be seen to be what would be only a small portion of an overall strategic plan. In other words the strategic plan itself has to be broken down into smaller sectors.

One can see then that a battle plan could exist for the ED or CO of an org which would have a number of elements in it which in their turn were turned over to subexecutives who would write battle plans for their own sectors which would be far more specific. Thus we have a gradient scale of the grand overall plan broken down into segments and these segments broken down even further.

The test of all of this is whether or not it results in worthwhile accomplishments which forward the general overall strategic plan.

If you understand all the above (it would be a good thing to do it in clay) you will have mastered the elements of coordination.

Feasibility enters into such planning. This depends upon the resources available. Thus a certain number of targets and battle plans, to an organization which is expanding or attempting big projects, must include organizational planning and targets and battle plans so that the organization stays together as it expands.

One writes a battle plan, not on the basis of "What am I going to do tomorrow?" or "What am I going to do next week?" (which is fine in its own way and better than nothing), but on the overall question, "What exact actions do I have to do to carry out this strategic plan to achieve the exact results necessary for this stage of the strategic plan within the limits of available resources?" Then one would have the battle plan for the next day or the next week.

There is one thing to beware of in doing battle plans. One can write a great many targets which have little or nothing to do with the strategic plan and which keep people terribly busy and which accomplish no part of the overall strategic plan. Thus a battle plan can become a liability since it is not pushing any overall strategic plan and is not accomplishing any tactical objective.

So what is a "battle plan"? It is the doable targets in written form which accomplish a desirable part of an overall strategic plan.

When one is talking about "mini programs" in an org, one is actually talking about small battle plans at the lowest tactical levels. These must be based upon a middle-management tactical plan and this in turn must be based on a strategic plan.

The understanding and competent use of targeting in battle plans is vital to the overall accomplishment that raises production, income, delivery or anything else that is a desirable end.

It is a test of an executive whether or not he can competently battle plan and then get his battle plan executed.

TARGET SERIES 11

TARGETS, MORE ABOUT

Your first program target must always be a production target — but you can't, in actual fact, write a pure production target. It would be impossible to write a pure production target because somebody would have to do it, and the moment that you have somebody there to do it, you have organization. So there is a certain amount of organization that comes into it.

If I were evaluating an org right now, say its Dept 7, I would have to include in it, as its second target, beefing up Dept 7. First target would be for Dept 7 to do anything it could to handle its collections. And the second target would be to beef up that department forthwith, bang bang! Otherwise the production would not continue. It would break.

So there has to be immediate organization for production.

TERMINABLE TARGETS

Now how do you like a target like this: "Maintain friendly relations with the environment." How do you like that target? It is utterly, completely not a doingness target. It isn't a target at all!

Now if it said "Call on so-and-so and so-and-so and make them aware of your presence . . ." and so forth, it could have a DONE on it.

Targets should be terminable — doable, finishable, completable.

REPEATING TARGETS

There is such a thing as a repeating target. You can accomplish it many times — it's like when you do org rudiments. Every time they do one of those targets a compliance is added to the compliance stat.

This is especially true of some targets in expansion programs.

WHAT IS A COMPUTER?

COMPUTER — An electronic machine for making calculations, storing and analyzing information fed into it, and controlling machinery automatically. *(Oxford American Dictionary)*

That, simply stated, is what a computer is.

A computer is capable of feats just so long as one does not make the mistake that it is thinking. It isn't thinking. But it can sure be made to look like something that thinks. In actual fact, the ones doing the thinking are the computer system designer, the programer and the user.

I should mention that what I mean by "user" is not a typist or someone who simply feeds in data. The user is somebody who knows how to get data into the computer and out of it. He knows that the computer can be *made to do work,* and he is running that computer for blood.

Operating a computer is not operating a calculator. A computer is not something which "eases the work" or "saves time" or "permits staff to do other things." That comes under the heading of wasting a computer. Used right, they can dig up and generate income by the steam shovelful, and boost efficiency and production to the sky. They are a tool with mammoth capabilities. The state of mind to assume in using a computer is "Now how can I use this thing to enormously increase the production and income of an area?"

What's happened on this planet, obviously, is that they think the computer will think — when it can't — and so they don't do enough thinking for the computer in terms of developing uses for it and putting these into action.

One point should be mentioned which is very valuable: and that is the speed of operation which can be attained using a computer. The computer can contribute enormously to operational speed in its ability to rapidly relay information over long distances, its ability to keep constant and accurate track of thousands of individual data and actions, and its capacity for rapid data collection and evaluation for action.

The datum here is that power is proportional to the speed of particle flow. This is the real secret behind the prosperity which can arise in connection with a computer operation.

Given good ideas, a good heart, a worthwhile project and the addition of near instantaneous computer particle flow, the power of an organization becomes almost unlimited.

COMPUTER ETHICS POINTS

As they are vital tools in forwarding the rapid expansion of Scientology, there has to be ethics about computers. Therefore, the following are classified as CRIMES:

1. MISFILING IN A COMPUTER.
2. NOT FILING IN A COMPUTER. In other words, it's against the law *not* to feed it.
3. PUTTING FALSE DATA INTO A COMPUTER.
4. MAKING CORRECTIONS TO SOMETHING AND INVALIDATING THE DATA IN A COMPUTER.
5. FAILING TO KEEP A COMPUTER CLEAN AND IN REPAIR.
6. RUNNING A COMPUTER WITHOUT FULLY CHECKING OUT AND STAR–RATING ON IT.
7. PERMITTING UNAUTHORIZED ACCESS TO A COMPUTER.
8. ALLOWING DAMPNESS AND/OR MAGNETIC FIELDS IN THE VICINITY OF A COMPUTER.
9. NOT USING A COMPUTER ONCE IT IS INSTALLED.
10. PRETENDING DIFFICULTIES WITH A COMPUTER THAT DO NOT EXIST.
11. FAILURE TO RECRUIT COMPETENT PEOPLE TO RUN A COMPUTER.

All justice policy applies, including ignorance of these regulations which is no excuse as well as the HCO PL 22 July 1982, KNOWLEDGE REPORTS.

Knowledge Reports written on any of the above CRIMES are routed per existing policies on staff member reports, but with an additional copy forwarded to INCOMM COMPUTER BANKS.

Any of these CRIMES may be reclassified as HIGH CRIMES if the offense or offenses are severe or repeated.

The computer is a tool and like any other tool it can be misused or abused or neglected. Used properly and with in-ethics, a computer system can be formidable and bring about prosperity.

After all, flourishing and prospering is what Scientology is all about.

HCO POLICY LETTER OF 23 NOVEMBER 1985

REMIMEO

COMPUTER SERIES 6

INCOMM

INCOMM is the International Network of Computer Organized Management.

PURPOSE AND PRODUCT

INCOMM's purpose is to establish and operate a major international management computer system which enforces the standard application of Scientology policy and technology and, as a result, brings about rapid planetary expansion.

INCOMM's product is:

> DEVELOPED, DISTRIBUTED, MAINTAINED AND PROPERLY USED COMPUTERIZED MANAGEMENT SYSTEMS WHICH ENORMOUSLY INCREASE THE PRODUCTION AND INCOME OF AN AREA.

INCOMM researches, develops, tests and implements operating programs for the international management computer system. All such computer programs must be based solidly on the principles of organization, operation and management found in HCO PLs, LRH EDs and other written and taped source materials on these subjects.

INCOMM has the responsibility of ensuring the stats, reports and other data put into its computer banks are true and verified. It polices and cross-checks incoming data and isolates false data and false stats and corrects.

ORGANIZATION

INCOMM is part of Church of Scientology International.

There are representatives of INCOMM posted outside its central headquarters, whose duty is to see that the computer systems in their assigned areas are kept functioning properly, to see that users are correctly hatted and to police in standard, on-policy use of the computer system.

INCOMM has the authority to take any needed steps to ensure that those who are supposed to use INCOMM computers are thoroughly hatted in computer use, and that they then *do* put the computers to work to greatly increase production.

POLICY

The design and structure of all INCOMM computer programs and systems are based on the third dynamic tech of Scientology as contained in the OEC Volumes and other source works.

Any INCOMM staff member who designs, produces or implements a computer program or system that is at variance with Scientology policy while calling it "Scientology," or one which uses Scientology while attributing it to some other source, may be called before a Committee of Evidence and charged with high crimes. (Ref: HCO PL 23 Dec. 65RA, SUPPRESSIVE ACTS, SUPPRESSION OF SCIENTOLOGY AND SCIENTOLOGISTS) Such action can also result in disciplinary measures taken by the Inspector General Network for the purpose of enforcing the trademarks of Scientology and Dianetics.

EQUIPMENT

INCOMM is responsible for the computer equipment used in its network. It directs what equipment is to be used and sees to its correct installation, upkeep, upgrade and repair, and ensures that users are thoroughly hatted on its use and care.

Computer users are themselves fully responsible for the use and care of any computer equipment assigned to them. It is a very strict requirement that anyone using computer equipment be fully hatted on its care and use and it is INCOMM's responsibility to see that this hatting occurs. Computer equipment is signed out to a specific user, who is thereafter responsible for it. (Ref: HCO PL 15 Feb. 64, THE EQUIPMENT OF ORGANIZATIONS)

AUTHORITY OF INCOMM COMPUTER PROGRAMS

While INCOMM's authority extends to its own personnel and network, and to ensuring that its computers are fully and standardly utilized by staff and execs, the authority of INCOMM computer *programs* is a different matter.

INCOMM computers are programed under the direct supervision of and monitored closely by senior management. And these programs are designed to be able to originate orders and also take steps to get them complied with. (For example, if an INCOMM computer program detects that compliance to a target assigned to a particular staff member is overdue, the computer program can nudge the target, issue an ethics chit for noncompliance per HCO PL 1 May 65 I, STAFF MEMBER REPORTS, and, if compliance is still not received, order further ethics action per policy.) In originating or following up on such orders, the computer is actually executing what its programers have set it up to do, per OEC policy. Orders and other communications issued by an INCOMM computer program are therefore valid and stem from the authority of senior management, authorized by AVC and governed by existing policy on compliance.

BACKGROUND

The power and capabilities of computers are almost unlimited. Unfortunately, the existing state of administration in the society today is so poor that most computers, no

matter how fancy their "circuitry," are being wasted. Computers end up being used only for counting up how much tax someone has to pay or predicting how many auto accidents will occur next year.

But I'll let you in on a little-known fact. On the track, real computers (not Earth's current home or business entertainment toys) have successfully administered whole planets. They actually were able to do work. They were *not* merely consoles and recorders that a person punched data into so that they would spit the data back at him.

The point here is that this planet's current popular concept of how to use a computer would make a baby laugh. It's a bit like using a nuclear reactor to boil water, which is also being done on this planet at this time.

FUTURE

But this is going to change. Today's current stone-age computers will be updated with "new" computer technology. (Sounds odd, but that's it.) The *use* of one will become real, for blood, doing work and getting work done use, which this planet has never seen (though seen on other planets).

Additionally something actually new will be done. Real computers will be applied to Scientology management. They are being programed based on OEC policy and HCOBs and will have something to operate on which is very sane, logical and prosurvival. The potentials of the whole track computer will be harnessed to the tremendously powerful administrative policy of Scientology to help get that policy IN and increase production.

Give an executive a few investigations and evaluations and these whole track computer operations and the computers and programs and let him use them to apply Scientology and the potential is there to send stats out through the top of the solar system. And on a planet in the shape this one is in, there is no time to lose in doing so. Getting a real computer network factual and functioning is about the same order of importance and magnitude as sending for a fire truck!

INCOMM is depended on and is there to get that job done.

ADMIN HIGH CRIME

Refs:

HCO PL	8 Mar. 66	KSW Series 13 HIGH CRIME
HCO PL	19 Aug. 79RA Rev. 27.8.84	Word Clearing Series 47 HIGH–CRIME CHECKOUTS AND WORD CLEARING
HCO PL	10 July 86 I	AKH Series 50 KEEPING ADMIN WORKING
HCOB	22 Feb. 72RA Rev. 8.7.74	Word Clearing Series 32 WORD CLEARING METHOD 4

With this issue, checkouts on policy by all administrative personnel become mandatory.

It has long been policy that technical personnel study, word clear, and star-rate check out on any technical materials before they apply those materials on their jobs. Pro auditors and interns at any level study, word clear and check out on the processes they are to run in session. Supervisors and Word Clearers star-rate on the basic materials of study tech and Word Clearing before they are allowed to deliver Scientology courses. And as new materials are issued, the Qual Division sees to it that the tech delivery personnel to whom the materials apply get them checked out IMMEDIATELY. Such checkouts have come to be known as “high-crime checkouts,” from the title of the policy letter which brought them into being: HCO PL 8 Mar. 66, HIGH CRIME. And it is through the use of such checkouts that tech application is safeguarded and kept in step with the latest technical discoveries and advances.

Tech people take great pride in keeping on top of their subjects in this way. Understandably so; for when they do, the results they achieve are consistent and

spectacular. Miracles are the order of the day. The public pour in for service. The organization thrives.

Where tech terminals don't KNOW and USE their materials, results are only anxiously hoped for. The public come in for service reluctantly, when they can be coaxed in at all. The organization dwindles.

HIGH–CRIME CHECKOUTS ON POLICY LETTERS

Just as there is STANDARD TECH, so is there STANDARD ADMIN.

The fact is that any organization can be seen to fail when standard administrative policy is not known and used by its people. And every successful organization will be found to be composed of people who DO know and DO apply the basic principles found in our policy letters.

Therefore the following is classified as a HIGH CRIME:

NEGLECTING, ADVISING AGAINST THE APPLICATION OF, FAILING TO ENFORCE OR TOLERATING THE OMISSION OF STANDARD WORD CLEARING AND STAR–RATE CHECKOUTS ON ALL NEW OR NEWLY REVISED HCO POLICY LETTERS, AS WELL AS THE KEY HCO PLs OF THE BASIC STAFF MEMBER HAT AND THE KEY POLICIES OF THE STAFF MEMBER'S SPECIFIC ASSIGNED POST, BY EVERY STAFF MEMBER. IN THE SEA ORGANIZATION THIS APPLIES TO LRH CBOs AND FLAG ORDERS AS WELL AS HCO POLICY LETTERS.

STAFF MEMBER RESPONSIBILITY

Once an exec or staff member has completed study of his hat by proper checksheet, he should report to the SSO in Qual to be word cleared Method 4 and star-rate checked out on the key policies of his staff member hat as well as those policies specifically relating to his post. And when any new policy is issued relating to his post (or which is an essential part of his hat as a staff member), he must get it word cleared, checked out and into application immediately.

Such checkouts can be done by Qual personnel or by another staff member on a twinned basis. They must be tough standard star-rate checkouts which consult the staff member's understanding and demand that he demonstrate his ability to apply the material.

Staff on technical posts are included under this policy, as they are responsible for their hats as staff members.

QUAL RESPONSIBILITY

The SSO must alert all staff of new or revised LRH policies received, must keep a log of policies checked out by each staff member (just as a log is kept for technical). He must ensure that this is done within a matter of days of receipt of the issue — NOT allowed to drag out so that a backlog accumulates. The SSO is responsible for

determining which policies are to be checked out by which staff, and logging them under the staff member's name in his checkout log. He should coordinate with the HCO Hatting Officer in making such determinations and in getting the checkouts done.

VIOLATIONS

The MAA or Ethics Officer, in investigating any post or area with down statistics must include an inspection of the Qual checkout log entries for the persons in the area being investigated. Where violations of this policy are found, the matter is reported to the HCO Area Secretary. The HCO Area Secretary must at once order a full and searching investigation into any persons who might have instigated it and report the matter with all particulars to the HCO Executive Secretary.

The HCO Exec Sec must then convene a Committee of Evidence with the persons accused as interested parties and must locate amongst them any suppressive or suppressives. When so located, they are duly declared as suppressive by HCO Ethics Order and dismissed.

If any Ethics Officer, Director of Inspections and Reports or HCO Area Secretary cannot obtain cooperation by superiors in carrying out this policy quickly, a report must be handed to the LRH Communicator directly, with a copy sent to the Inspector General Network via Flag.

The LRH Comm must act swiftly and effectively to handle the matter with proper justice action, reporting actions taken and results on LRH Communicator Network lines to LRH Comm International, with a copy to the Inspector General Network.

COMPUTER VERIFICATION

The International Network of Computer Organized Management (INCOMM) will be preparing a computerized system to verify that this policy is in force in every organization, and to call for HCO ethics action where it is found to be out.

With STANDARD ADMIN known and conscientiously in use on every post, the game is ours.

EXECUTIVE SERIES 1

THE EXECUTIVE

(Note: Those personnel in orgs who are titled as executives are: the board members, the Commanding Officer or Executive Director or head of the org, the HCO Executive Secretary, the Org Executive Secretary, the Public Executive Secretary, the heads of divisions and the heads of departments. In very large orgs the title is extended to heads of large sections. To these listed persons especially this data on executives applies.)

Before one can adequately perform the duties of an executive in an organization one would have to know what an executive is.

EXECUTIVE: One who holds a position of administrative or managerial responsibility in an organization.

To give one some idea of the power associated with the word, Noah Webster, in 1826, defined it as "The officer, whether king, president or other chief magistrate, who superintends the execution of the laws; the person who administers the government; executive power or authority in government. 'Men most desirous of places in the executive gift, will not expect to be gratified, except by their support of the *executive*.' Josiah Quincy."

Executive is used in distinction from legislative and judicial. The body that deliberates and enacts laws is legislative; the body that judges or applies the laws to particular cases is judicial; the body or person who carries the laws into effect or superintends the enforcement of them is executive, according to its nineteenth-century governmental meaning according to Webster.

The word comes from the Latin "*Ex(s)equi* (past participle *ex(s)ecutus*), execute, follow to the end: *ex-*, completely + *sequi*, to follow." In other words, he follows things to the end and GETS SOMETHING DONE.

Taking up the definition part by part we can achieve a considerable understanding of the nature and beingness of an executive.

"One who holds a position . . ." A *position* is a place or location. It is social standing or status; rank. It is a post of employment; job. The sense of this is that an executive is

a STABLE TERMINAL for his staff and assistants. He is not continuously elsewhere or missing. He actually holds his position, social standing, status, rank and performs his duties from that position. He is known and visible and in one way or another reachable or himself reaches those areas which need to be handled.

". . . of administrative . . ." in the definition would refer to his actions in administering his area. *Administer* means "to have charge of; direct; manage." It is taken from the Latin *administrare,* to be an aid to: *ad-,* to + *ministrare,* to serve. From *minister,* servant. By this we see that he has charge of, directs, manages and SERVES his area.

". . . or managerial . . ." refers to management, which is the act, manner or practice of managing, handling or controlling something. Skill in managing, executive ability, which means that the activity is HANDLED or CONTROLLED by the executive.

". . . responsibility . . ." means the state, quality or fact of being responsible, and responsible means legally or ethically accountable for the care or welfare of another. Involving personal accountability or ability to act without guidance or superior authority. Being the source or cause of something. Capable of making moral or rational decisions on one's own and therefore answerable for one's behavior. Able to be trusted or depended upon; reliable. Based upon or characterized by good judgment or sound thinking. This means essentially that an executive DOES NOT WAIT FOR ORDERS TO ACT. He is the one who, guided by policy, acts on his own initiative to handle and supervise his area and others and does not himself require supervision.

". . . in an organization." An organization means the act of organizing or the process of being organized. The state or manner of being organized: "a high degree of organization." Something that has been organized or made into an ordered whole. A number of persons or groups having specific responsibilities and united for some purpose or work. Thus an organization is an activity or area that is being organized or has been organized or made into an "ordered whole."

Thus, from the words and definitions taken from the language itself and the tradition of the culture, we can see what an executive is, what he does and what he eventually has — an organization.

It is very interesting that one can examine the above definition and subdefinitions and analyze an executive's general competence. Where any of these things are missing in his character or duty or general conduct, there is very likely to be a flaw in the activity he has under his authority. One could go over these items one by one, for himself or for another, and he would see at once what had to be improved and what was satisfactory in his or others' executive beingness.

In order to competently achieve the beingness of an executive, one would have to have the technology of how to organize and would have to have, as well, a concept of the ideal scene of an organization in order to compare it to any existing scene and would have to be familiar with the technology required in that specific organization by which it produces the products necessary for its survival.

In that every organization has value only to the degree it produces, one can see that an executive should be able to achieve production long before his organization is perfected and to be able to perfect the organization while producing. Otherwise the organization would not be sufficiently viable to survive and his status as an executive would cease.

Good executives are very valuable and the value consists of their ability to obtain production and form the necessary and adequate organization in order to do so. There are no stellar executives who do not meet every piece and part of the above definitions.

EXECUTIVE SERIES 2
LEADERSHIP

In order to get his job done, an executive must be someone from whom others are willing to take orders.

The first test any follower of a leader requires the leader to meet is competence. Does the leader know what he is doing? This is already covered in the definitions of an executive. For if an executive meets these definitions, those to whom he must give orders are very likely to receive them in confidence.

There is a great deal of mystique (qualifications or skills that set a person or thing apart and beyond the understanding of an outsider) connected with leadership. Most of this mystique is nonsense; however, it is necessary that one who leads can attract attention and that he can enthuse and interest others. Simply knowing more about the subject than others or knowing more about organization than others can cause an executive to be regarded respectfully or even with awe.

A common denominator to all good executives is the ability to communicate, to have affinity for their area and their people and to be able to achieve a reality on existing circumstances. All this adds up to understanding. An executive who lacks these qualities or abilities is not likely to be very successful.

Understanding, added to competence, is probably the most ideal character of an executive.

The ability to lead can also be compounded of forcefulness and demandingness, and these two qualities are often seen to stand alone in leadership without regard to competence and, though acceptable to juniors to the degree that they will obey, are no long-term guarantee of an executive's supremacy. While they are often part of a successful executive's personality, they are not a substitute for other qualities and will not see him through. He must truly understand what he is doing and demonstrate competence on a long-term basis in order to achieve distinction and respect.

In all great leaders there is a purpose and intensity which is unmistakable. Plus there is a certain amount of courage required in a leader.

A man who merely wants to be liked will never be a leader. Others follow those who have the courage to get things done even though they *say* they follow those they like. A broad examination of history shows clearly that men follow those they respect. Respect is a recognition of inspiration, purpose and competence.

The qualities of leadership are not difficult to attain, providing they are understood.

MONEY

So you think the GI should be higher.

So you wonder why the staff isn't paid better.

In order to successfully solve these riddles it is necessary to know something about MONEY.

Basically *money* is "an idea backed by confidence."

The idea is that the exchange of goods or services kind for kind is too clumsy. To carry your dozen eggs all over town until you find someone who has bread he will exchange for your eggs so you can have bread is too clumsy. That is called a "barter (trading) system" and is used in primitive tribes. To solve this, men get the idea of making metal or slips of paper represent the eggs and the bread. Thus you don't need to look all over town. Anyone will buy your eggs that wants eggs and give you money and anyone who has bread will accept money for it. Like: one money particle is worth five loaves of bread or one dozen eggs or two hours of manual labor or one booklet or a square inch of land or — or — or.

Confidence comes in that the money particle (piece of metal or paper or some such symbol) WILL be further accepted after you have accepted it for your eggs. This extends to confidence in the country that issued the coin or the paper.

As metal has other uses — gold, silver, copper, bronze — it is more likely to have confidence placed in it as the country could go broke and one would still have his metal. With paper one has to have more confidence in the country.

So MONEY is only something that can be exchanged confidently for goods or services. It is a symbol which represents value in terms of goods or services.

When money is paid out without buying value (as in welfare handouts or war materials or bad stocks or just a promise with no backing) it itself gets into trouble. It begins to buy less because it no longer represents production or services or value.

When one begins to receive and spend money he gets into a field known as ECONOMICS.

To understand money one *must* understand economics. Or he'll be made a fool.

ECONOMICS in modern language means "the social science that studies the production, distribution and consumption (using) of commodities (things)."

If you like money or want money or use money you cannot remain ignorant of "economics."

The reason Marx and socialists in general can fool everyone is that there are very few people who know economics and economics itself is not a science but a primitive art. So just as you may stumble on this word "economics," so can the supertotalitarian socialists make whole societies stumble and fall into their hands.

The word originally meant "the science or art of managing a house or household" and that is still its first meaning. From this grew up a study of the whole community as a connected activity.

Remember, *money* represents *things*. It is a substitute for goods and services.

What governments, people and even our orgs can't get understood is that NO PRODUCTION = no money.

If one performs a valuable service *and* exchanges it for goods, he does so through the item of *money*.

Production can mean producing a service or an item that can be exchanged for goods and services.

If an activity does not produce *and* deliver *and* exchange with other activities, no money is possible.

Example: Lack of good Division 6s (Public Division) in orgs makes it impossible to *exchange* with the community. Equals no money.

This is what is behind low gross income.

The steps to take are, get the org so it can produce a valuable service in some volume and then *exchange* through Div 6 contacts that service with the community for *money*. Then increase the volume and quality of the service and increase the exchange through more Division 6 contacts. That builds up to a big GI that will continue to be big and not slump.

As soon as one ceases to deliver the service the *exchange* breaks and the GI collapses. No matter how hard you *sell*, if you don't deliver, you get into trouble.

The staff member, as part of the org, may think his pay comes from mysterious places. It does not. It comes from his own personal production.

The combined services of staff members give the org the valuable final services it can exchange for *money*. If it does this, then the staff member gets paid and cared for.

It is up to Division 6 to build up a DEMAND for the services and a volume of people who then demand the service. It does this with surveys of what the public will buy that the org can offer. It then makes the public aware of this by ads and

contacts. The public comes in and pays. The rest of the org keeps itself functioning and delivers it.

That is really all there is to it.

When you see a staff unpaid or an org not very solvent, it is the data above that is not grasped.

When you see an org solvent and its staff well paid, then the majority there have grasped this and are doing it.

When they do it well enough and in enough volume, they control more and more goodwill and expand.

People today are very badly taught on this subject. All money comes from daddy. Governments roll it out in endless streams (and the currency becomes worthless).

It's no wonder people believe in "luck" as the only thing that makes them rich and powerful. Or some wild idea that was never tried and would be a flop.

The truths of wealth are:

Income of money on sales must be greater than outgo on bills.

Books, auditing and training, tapes and meters, must be sold for more than they cost the org to produce or buy.

Money is simply that which represents delivered production.

Morale also depends upon accomplished and exchanged production.

Money does *not* equal morale. The idle rich are a wonderful study in psychosis.

And welfare money degrades because it is not exchanged for delivered production.

These are all factors in economics.

The way to good pay is an understanding of the subject as above and the work necessary to make it so.

EXCHANGE

So many tricks have been entered into economics systems, and so many political fixations exist that a manager is often very hard pressed trying to bring about solvency for his activity.

Money can be manipulated in a thousand different ways.

There are "speculators" who seek to buy something (like land) cheaply and sell it dear. Or sell it dear, depress the market and buy it back cheaply. In either case they make a profit.

It is less well understood that "speculators" also operate on the subject of money itself. By manipulating the value of one currency against another they seek to obtain a profit. This is the "international banker" at his daily work. He buys a hundred billion French francs for x dollars. Then he causes a panic about dollars. The franc gets very valuable. He sells his hundred billion French francs for 2x dollars. Then he says dollars are great. He has "made" a huge new lot of dollars for himself.

Or he finds a crummy politician like Hitler, builds him a war machine, gets paid back out of the plunder of Europe before Hitler collapses.

The banker loans George Manager 100,000 to modernize his plant. George wanted 200,000. But he takes the 100,000. The banker holds the whole plant as security. George doesn't make it as it really took 200,000 to do it. He goes broke. The banker grabs the 5,000,000 plant. This includes the 100,000 now spent on new machines. The banker sells it to a pal for 2,500,000 and makes that sum on his "loan."

The shareholders of Bide-a-Wee Biscuit are told Bide-a-Wee is busted. The stock falls. A group buys the stock up for peanuts, emerges as the owners of Bide-a-Wee which turns out not to be busted.

All these and a thousand thousand other systems for making money, indulged in too often, spoil CONFIDENCE and destroy money.

Eventually a whole religion like communism will grow up dedicated only to the destruction of capitalism. What has been dropped out is the idea of EXCHANGE.

Money has to *represent* something because it is not anything in itself but an idea backed by confidence.

It can represent gold or beans or hours of work or most anything as long as the thing it represents is real.

Whatever it represents, the item must be exchangeable.

If money represents gold, then gold must be exchangeable. To prove this, the moment gold couldn't be individually owned, the dollar, based on it, became much less valuable.

There has to be enough of the thing that money represents. By making the thing scarce, money can be manipulated and prices sent soaring.

Economics by reason of various manipulations can be made into the most effective trap of the modern slave master.

Periodically through history, not just in current times, monied classes or those believed to control money have been torn to bits, shot, stoned, burned and smashed. The ancient Pharaohs of Egypt periodically lost their country through tax abuses.

Money, in short, is a passionate subject.

Modernly, the lid is coming off the economic pot which is at a high boil.

Too many speculators, too many dishonest men generating too much hate, too many tax abuses, too many propagandists shouting down money, too many fools, all add up to an explosive economic atmosphere.

A group has to be very clever to survive such a period. Their economic arrangements and policies must be fantastically wise, well established and followed.

As it exists at this writing, the only real crime in the West is for a group to be without money. That finishes it. But with enough money it can defend itself and expand.

Yet if you borrow money you become the property of bankers. If you make money you become the target of tax collectors.

But if you don't have it, the group dies under the hammer of bankruptcy and worse.

So we always make it the first condition of a group to make its own way and be prosperous on its own efforts.

The key to such prosperity is *exchange*.

One exchanges something valuable for something valuable.

Processing and training are valuable. Done well, they are priceless.

In many ways an exchange can occur. Currently it is done with money.

In our case processing and training are the substances we exchange for the materials of survival.

To *exchange* something one must find or create a *demand*.

He must then supply the demand in EXCHANGE for the things the group needs.

If that is understood, then at once it is seen that (a) a group can't just process or train its own members and (b) a group cannot give its services away for nothing and (c) the services must be valuable to those receiving them, (d) that the demand must be established by surveys and created on the basis of what is found and (e) that continual public contact must be maintained.

Thus, by bringing the problems of viability down to the rock-bottom basics of *exchange,* one can cut through all the fog about economics and money and be practical and effective.

If one is living in a money economy, then bills are solved by having far more than "enough money" and not spending it foolishly. One gets far more than "enough money" by understanding the principles of EXCHANGE and applying them.

In another type of economy such as a socialist state, the principles still work.

The principles of exchange work continuously. It does not go high and collapse as in speculation or demanding money but failing to deliver. Or delivering and not demanding money.

We see around us examples that seem to violate these principles. But they are nervous and temporary.

What people or governments regard as a valuable service is sometimes incredible and what they will overlook as valuable is also incredible. This is why one has to use surveys — to find out what people want that you can deliver. Unless this is established, then you find yourself in an exchange blockage. You can guess, but until you actually find out, you can do very little about it.

Once you discover what people want that you *can* deliver, you can go about increasing the demand or widening it or making it more valuable, using standard public relations, advertising and merchandising techniques.

The fundamental is to realize that EXCHANGE is the basic problem.

Then and only then can one go about solving it.

ADMIN KNOW-HOW SERIES 29
EXECUTIVE SERIES 5

NOT–DONES, HALF–DONES AND BACKLOGS

There is a very definite, often unsuspected effect concealed in a backlog. And it is of such violence that it can crash an area's stats while seemingly working frantically.

BACKLOG *(Webster's)* noun: 3. an increasing accumulation of tasks unperformed or materials not processed; verb: to accumulate as a backlog.

NOT–DONES AND HALF–DONES

Backlogs occur for various reasons. But the two main classes are (1) NOT–DONES and (2) HALF–DONES.

For lack of seeing that a backlog exists, lack of supervision of existing personnel, other-intentionedness of personnel, lack of personnel to handle the usual or peak volumes, lack of know-how to handle, lack of resources, and outright sabotage are some of the reasons that account for NOT–DONES.

HALF–DONES are as bad as NOT–DONES as they bit and piece an area into a quagmire. Suppose Detroit began to make half-cars. All their resources would be devoured, yet nothing would really be produced, yet everyone would look frantically busy; the executive worries would mount up to an inconceivable fever pitch unless the half-done factor was handled.

But half-dones are not always as visible as half-cars. "Have you handled Bets and Company suit?" "Oh yes." But the case is lost because the filing papers were only half-prepared and half-filed.

The same reasons apply for HALF–DONES as are listed above for NOT–DONES.

The Why of many failures is found in NOT–DONES and HALF–DONES.

The primary effect (there are others) of NOT–DONES and HALF–DONES is the building up of *backlogs*.

Now, no backlog ever quietly lies there. So long as anything else depended upon the actions being done, there will be pressure or threat of one kind or another on the backlogged area.

Thus when an activity becomes backlogged IT GENERATES NEW WORK NOT CONCERNED WITH REDUCING THE BACKLOG AMOUNT.

Example: An insurance company backlogs claims payments. Torrents of queries then demand why. The claims section spends its time answering the queries, not reducing the number of claims. The volume of work doubles, trebles, but no claims get paid.

BACKLOGGING AT ONCE DOUBLES THE WORK BY THE ADDITION OF DEMAND HANDLING.

Example: A Central Files fails to stay filed into up to present time. Demands for items in it cause others to consume all the file clerk's time tearing CF apart to find particles.

A BACKLOG CAN INCREASE ITSELF BY ADDING DISORDER THAT UNDOES THINGS ALREADY DONE.

Thus a backlog tears up the past work while building up future work.

Example: Personnel backlogs its files, causing it to backlog appointments. This overloads areas. These areas start crashing down on Personnel in mobs demanding it provide people. Personnel is then so busy fending off people it can't appoint. Yet is in frantic action.

A BACKLOG PREVENTS ITSELF FROM BEING HANDLED.

An org that has several backlogs in it becomes frantic and then goes into apathy.

The cure is to:

1. Get people and do ALL HANDS actions to get the most important backlogs done.
2. To find the real WHY of the backlog and handle it so a present time state is then maintained. (Requires a program, followed and *done*.)
3. Check out staff on the book *The Problems of Work*.
4. Get staff to do Training Drill Zero on their work areas.
5. Get staff to reach and withdraw from their materials of operation or areas.
6. Do a survey of attitudes which reveal complaints and reasons for not-dones, half-dones, backlogs.
7. Based on the survey, campaign hard to remedy NOT–DONES and HALF–DONES.
8. Be very severe with any beginnings of any future backlogs.

When you see an area or org in apathy, know it has gone the route of not-dones, half-dones and backlogs and handle.

When you see an area going frantic, know you are looking at not-dones, half-dones and backlogs and handle fast before it goes into the much worse condition of apathy.

Production is the basis of morale.

Not-dones, half-dones result in backlogs.

Backlogs destroy the possibility of future production.

Thus you know the situation of not-dones and half-dones will result in backlogs.

The backlogs will prevent further handling.

This subject *is* the subject which makes executives harassed.

Behind every upset there will be NOT–DONES, HALF–DONES and BACKLOGS.

So be very alert.

Dynamite is stick candy alongside of this very explosive subject.

Don't say I didn't tell you.

STAFF HATS

EXECUTIVE SERIES 6

EXECUTIVE INTENTION

Executive intention plays a major role in the successful production of an org or activity.

An executive who disagrees with policy, disagrees with Flag or the CLO, will find that his area does not produce well, if at all. Internal cross orders are rampant, no one locates or applies the pertinent policies, and the activity declines from there.

The executive who is in conflict with Flag or the CLO or policy will find his staff in conflict too. And the staff will be in conflict with the executive as well!

This piles up to no real production.

The cycle goes like this:

Executive in combat with senior management body issues orders counter to general policy. Staff members try to do the action as ordered but find they cannot — as it is against policy and so is against the structure of the organization. Staff members mess up and wind up in confusion, no production, ethics trouble.

Eventually it reaches the point that the exec won't be able to get any of his orders complied with at all — as staff have lost confidence in his leadership — and there goes the exec.

THE SOLUTION

The way out of all this is for the executive to himself set a *good* example for his staff — to himself reinforce the orders, policies and intention of command and senior management.

ONLY IN THIS WAY CAN REAL PRODUCTION OCCUR.

The more familiar the exec is with authorized policy and the more he agrees and reinforces it, the better the organization will run.

STAFF RESPONSIBILITY

It is the responsibility of every staff member to know the policy in his hat and do it.

LRH policies are always senior to any Mission Orders, Project Orders or other types of issues.

By not following policy line by line, the staff member is set up for a rough time.

By accepting illegal orders, a junior staff member knows he is facing the potential collapse of his post or area and the eventual decline of the org.

POLICY

Therefore, the following policy is laid:

A JUNIOR WHO IS GIVEN ILLEGAL OR CONTRARY ORDERS AND WHO FOLLOWS THEM INSTEAD OF POLICY LETTERS, EDs AND FLAG ISSUES AND WHO DOES NOT REFUSE THE ILLEGAL ORDERS AND WHO DOES NOT REPORT THE MATTER IS SUBJECT TO COMM EV FOR ACCEPTING ILLEGAL ORDERS.

LEGAL ORDERS ARE DEFINED AS ORDERS KNOWN TO AND AUTHORIZED BY FLAG IN WRITING OR AS FOUND IN POLICY, EXECUTIVE DIRECTIVES, FLAG DIVISIONAL DIRECTIVES AND ISSUES.

IF IT IS NOT WRITTEN AND SEEN IN WRITING, IT IS NOT TRUE. VERBAL RELAYS OF FLAG COMMANDS ARE NOT ACCEPTABLE.

RELAYING, ORDERING OR CARRYING OUT A LEGAL ORDER IN SUCH A WAY AS TO MAKE IT UNWORKABLE IS A COMM EV OFFENSE.

Staff members should point out this policy to an executive who has issued an illegal order, along with the Flag-authorized issue to show why the order is illegal. In this way a staff member can get the illegal order changed and prevent further upset. Any refusal to withdraw a provenly illegal order may be reported by any means available to any LRH Comm, Flag Rep, or to Flag, with copies of the evidence.

The LRH Comm should be consulted if conflict persists.

Further the LRH Comm must cancel any illegal orders encountered, whether verbal or written, and refer the matter to the proper HCO PL, ED or Flag issue.

IT HAS BEEN PROVEN CONCLUSIVELY THAT ORGS "NOT QUITE WITH" THE SEA ORG AND FLAG HAVE BAD STATS AND THE PUBLIC STAYS AWAY IN DROVES.

ORGS THAT ARE WITH US — COOPERATIVE AND GUNG–HO TOWARDS US — ARE MAKING IT WITH GOOD STATS AND PUBLIC POPULARITY.

A NATURAL COINCIDENCE THAT OCCURS OF ITS OWN ACCORD.

EXECUTIVE SERIES 7

TARGETING OF DIVISIONAL STATISTICS AND QUOTAS

According to HCO Policy Letter of 16 Dec. 65 II, STATISTICS OF THE INT EXECUTIVE DIV, a statistic is a number or amount compared to an earlier number or amount of the same thing and refers to the quantity of work done or the value of it in money.

In a Scientology organization every division, every department and every post has an assigned statistic which represents its work or production. Also in a Scientology organization there is always some individual assigned as responsible for the work or production of every division, every department and every post.

A staff member is required to report weekly the statistic of every post for which he or she is responsible. To do this the staff member has to keep a daily running record of such statistics; therefore, it is possible to compare the statistic of one day to the statistic of the day before, to predict by computation the projected statistic for the week as compared to the already reported statistic of the past week and to cause actions to occur which lead to the increase of the daily statistic and to the ultimate increase of the weekly statistic.

That the individual is directly responsible for being able to affect and increase such statistics is easily demonstrable — if a Letter Registrar spends most of her time wiping spilled coffee off Central Files folders rather than writing real letters which communicate and elicit responses for service, then her statistic will certainly drop.

With the advent of HCO PL of 31 Jan. 72, Data Series 22, THE WHY IS GOD, there is no justifiable reason left for anyone as to why statistics cannot be raised. Therefore the reason for so few people directed into the organization for Registrar interview will mean exactly and only that the Letter Registrar is not producing.

Having, therefore, defined what a statistic is and having firmly established that the individual is directly responsible for a statistic and so can increase it, the subject of how targeting and quotas relate to statistics can now be covered.

Quota is defined as a production assignment. It would be the number assigned to whatever is produced. As an example, the Director of Training is given the quota of 45 letters to produce per day or 225 letters per week as part of his standard promotional actions.

Targeting is defined as establishing what action or actions should be undertaken in order to achieve a desired objective. In the case of the Director of Training it would be

as simple as obtaining from Central Files the necessary 45 folders, writing the required number of letters, returning the folders to Central Files and determining to remain on post daily until this was accomplished no matter what (known as keeping his own ethics IN).

Any quota can be targeted for increase daily and weekly. For instance, the Director of Training can establish a quota of 5 extra letters per day over that of the day before. This would mean he would write 45 letters one day, 50 letters the next day, 55 letters the day after that, and so on.

In highly successful organizations the practice of setting quotas and targeting has been in use for some time.

The product officer (or in the absence of the product officer, the Executive Director) establishes with the divisional secretaries exactly what quotas will be for the weekly divisional statistics in order to increase them over those of the previous week and HOW this will be done. The divisional secretaries do the same with their department directors, the directors with their section in-charges and the section in-charges with the personnel under them.

The quotas established are real and are always higher than those of the week before, with the idea in mind of creating a continually rising statistical graph. If this is done, the statistics rise, the organization expands, and more personnel are recruited, apprenticed and trained on posts so that more production can occur to keep the statistics rising.

The targeting of actions necessary to accomplish the quotas are definite, conform to policy and *can* be *done*. Do not permit nebulous generalities to occur on the targeting cycle as nothing will be accomplished and no quotas achieved.

All staff must keep a daily graph of their statistic and an accumulating graph for the week, both on the same graph sheet. An accumulating graph merely means you keep adding one day's statistic to those of the day before. In the example of the Director of Training it would be 45 letters Monday, 95 letters Tuesday (the 45 letters of Monday added to the 50 letters of Tuesday and so on). Daily the persons responsible check these graphs with their juniors. From these graphs it is easy to see whether the statistics are rising, whether quotas are being met and whether the statistic will be higher than that of the prior week.

By such means targets can be unbugged, new targets established and new quotas projected; or hatting and more establishing can occur, or ethics can be put in where the individual appears incapable of keeping his own in (as in the example of the Letter Registrar who spends more time going to the canteen for coffee than on post).

A set time can be determined *daily* as to when each staff member should have his graph posted for inspection — probably 2:00 P.M. would be best as this is the time established as when the week starts and ends, from the Thursday of one week to the Thursday of the following week. Seniors can then easily make their inspection without being delayed while some staff member computes and posts his graph.

By setting quotas and targeting towards their production, get your statistics rising.

EXECUTIVE SERIES 8

THE TOP TRIANGLE

The explanation of the Scientology Symbol, the S and double triangle, should be more generally known.

And it should be very well known to executives.

There are *two* triangles, over which the S is imposed.

The S simply stands for Scientology which is derived from "SCIO" (knowing in the fullest sense).

The lower triangle is the A-R-C triangle — its points being AFFINITY, REALITY and COMMUNICATION. These are the three elements which combined give UNDERSTANDING.

The upper triangle is particularly applicative to an executive but applies to all Scientologists. It has not been widely known.

It is the K-R-C triangle. The points are K for KNOWLEDGE, R for RESPONSIBILITY and C for CONTROL.

It is difficult to be responsible for something or control something unless you have KNOWLEDGE of it.

It is folly to try to control something or even know something without RESPONSIBILITY.

It is hard to fully know something or be responsible for something over which you have no CONTROL, otherwise the result can be an overwhelm.

A being can of course run away from life (blow) and go sit on the backside of the moon and do nothing and think nothing. In which case he would need to know nothing, be responsible for nothing and control nothing. He would also be unhappy and he definitely would be dead so far as himself and all else was concerned. But as you can't kill a thetan the state is impossible to maintain and the road back can be gruesome.

The route up from death or apathy or inaction is to KNOW something about it, take some RESPONSIBILITY for the state one is in and the scene and CONTROL oneself to a point where some control is put into the scene to make it go right. Then KNOW why it went wrong, take RESPONSIBILITY for it and CONTROL it enough to make it go more toward an ideal scene.

Little by little one can make anything go right by

INCREASING KNOWLEDGE on all dynamics,

INCREASING RESPONSIBILITY on all dynamics,

INCREASING CONTROL on all dynamics.

If one sorts out any situation one finds oneself in on this basis, he will generally succeed.

Field Marshal Montgomery was supposed to have said that leadership was composed of "knowledge, willpower, initiative and courage." These are assumed qualities in a man. This was good advice but offered no road out or no avenue of INCREASE in capability.

The KRC triangle acts like the ARC triangle. When one corner is increased the other two also rise.

Most thetans have a dreadfully bad opinion of their capabilities compared to what they actually are. Hardly any thetan believes himself capable of what he is really capable of accomplishing.

By inching up each corner of the KRC triangle bit by bit, ignoring the losses and making the wins firm, a being at length discovers his power and command of life.

The second triangle of the symbol of Scientology is well worth knowing.

It interacts best when used with high ARC. Thus the triangles interlock.

It is for *use* as well as all of Scientology.

EXECUTIVE SERIES 9

ROUTING

Strangely enough, a major duty of an executive is ROUTING. This means pointing out the channels on which bodies, materials, products or despatches and letters flow. Or making channels on which such things can flow and putting terminals there to handle or change them.

An executive who does NOT route and who does not himself conduct a continual *line police action* is soon drowned. He will lose his grip on his post and his activity and "feel overwhelmed" and worked to death. Further, the whole unit under him and units around him will go to pieces.

The difference between order and chaos is simply straightforward planned flows and correct particles. It is the executive who controls this. So it is in his hands whether he or she has chaos (no line or particle control) or order (good line and particle control).

It is SO much simpler than it looks and SO easy to overlook that many persons on executive posts look everywhere for "the answer" to their troubles when it lies right under their nose — actually.

It begins with one's own desk and office. It is simple. Does one have an in-basket? Does one have an out-basket? Does one use them? Is there any way for things to get into the in and out of the out?

Does one spend a part of each day clearing ALL traffic at once?

Is the traffic divided up into areas and types?

You say, "That's too simple. It's even silly. Here I am a Big Executive and you're asking about these little pieces of paper . . ."

Those little pieces of paper are what keep one informed and extend one's reach! And they can turn into a blizzard and blow one right off post!

There is power in those lines.

So they must be in a neat pattern or the power recoils.

What drives one (and one's organization) off post is *mishandled* items. The *volume* is not at fault. One can handle TONS of this stuff. It is the mishandled bits that make the TONS look hopeless.

One often unwittingly generates mishandlings. And if he does NOT police his lines, he can snow the whole org under.

A sharp executive can spot "developed traffic" (needless) miles away. The slang term "dev-t" has been of vast use.

Pieces of paper that don't belong to one are sent back to originator.

Things originated by a post that aren't the business of that post.

These are the two basics of dev-t — "off-line" and "off-origin."

Juniors that don't do Completed Staff Work but load you up with problems *they* should have solved are responsible for the worst of one's traffic.

So if all you knew was the above — baskets in and out and ways for traffic to get in and out, what should come to you and what certain posts should be sending — AND POLICED IT, you could reduce your traffic worries by three quarters.

AN UNHATTED ORG is a madhouse to work in as no one knows what he's supposed to handle or what others should do. They don't go idle. They introduce Sahara sandstorms of dev-t.

An unhatted org is also a lazy org and *refers* everything to someone else.

Bodies won't channel, correct materials won't arrive, money can't get in or out, production is destruction and the place unpleasantly goes insolvent.

To move such a scene up toward the ideal, one can at least begin to police his own immediate desk and lines. Then one can police his own immediate staff's lines and clean that up.

He can HAT those around him. "This is what you're supposed to handle. This is what you DO."

He can even hat at a distance on his comm lines, "This despatch belongs to Supply. Send it to Supply, not to me."

"CSW please" = "Work out how this problem should be handled and recommend. Don't be dumping problems of your post on my plate" is the real meaning of "CSWP."

Get an Admin Cramming in and send anyone who is dev-ting to it to get checked out.

But mainly and foremost, get the place HATTED so it knows what it should handle.

And first, last and always conduct a line police action.

One of the first duties of an executive is ROUTING.

Now do you see where the "overload" is coming from?

Note: See dev-t policies, *The Problems of Work* and the Org Series to get the full scope and know-how of ROUTING. But the main thing is DO it. Do it before you drown.

ISSUE I

REMIMEO

EXECUTIVE SERIES 10

CORRECT COMM

Dev-t (developed or wrong traffic) destroys any real production in an org while making the org seem frantically busy.

The downfall of HCO was THE FAILURE TO POLICE DEV-T.

The CAUSE of DEV-T is UNHATTEDNESS.

People who do not know what they are supposed to do or produce take on traffic that does not belong to them, originate traffic they have no business with *and* send it to wrong terminals who don't handle.

Not knowing their hats or posts, they *refer* things *they* should handle to others who don't handle them either. The org loads up with not-dones and half-dones and backlogs.

People who should refer what they know don't originate at all and sit on hot emergencies and leave them unhandled. And if they *do* send them on, not knowing the org board, they send them to the wrong terminals. And if they send it to the right terminal it goes in a way it can't be handled for lack of comm expertise.

This goes for any type of particle — despatches, letters, bodies, money, customers, materials, supplies, any particle.

Problems are brought to seniors instead of Completed Staff Work (requiring a recommendation).

DEV-T means an UNHATTED UNTRAINED OFF–POLICY STAFF.

It means loads of overwork and little production or income.

AND DEV-T AND UNHATTEDNESS MEAN THAT THE PERSON AT THE TOP OF A DEPARTMENT, DIVISION OR THE ORG HAS TO SINGLE–HAND.

It isn't an org, it's a mob.

Unhatted staff "go criminal," so ethics will be very heavy.

A first action for an executive or any terminal is to demand CORRECT COMM.

In its basic elements this means:

1. The staff member originates things that apply or are the business of HIS OWN POST. *(On-origin)*
2. The origin is sent to the right terminal that handles that. (On-line)
3. If a post is supposed to originate, it does so. (Communicates)
4. If a problem is encountered it is forwarded ONLY with a full recommendation for handling. (Completed Staff Work or CSW)
5. One does NOT accept a comm that is not the post business of the originator. (Enforces on-origin)
6. One does NOT accept a comm that does not belong to him. (Enforces on-line)
7. One insists that a post should originate or do the duties or furnish the product or service of that post. (Enforces correct action)
8. One never accepts a problem unless it has with it a sound recommendation by the originator accompanying it. (Enforced CSW)
9. One demands specific names and instances, not generalities. (Nonsuppressive comm)
10. One demands full particulars, not half-reports or vague generalities. (Non-suppressive comm)
11. One demands comm be in proper form. (Correct despatch or completed)
12. One has a place to receive the comm. (In-basket or place in org)
13. One has to have a place to put the comm for delivery. (Out-basket or comm center)
14. One has to have standard lines and routes for particles to follow. (Comm system or lines)
15. One demands use of the system 1 warning, 1 admin cramming, 1 retread as an expeditor or in Estates to redo basics for frequent offenders.
16. One demands HATTEDNESS and people performing the duties of their posts!
17. One demands an up-to-date org board and staff drilled on it.
18. One NEVER STALEDATES. He handles when he is expected to.
19. One does NOT go soft in the head or get reasonable or find exceptions. THERE IS NO SUBSTITUTE FOR CORRECT COMM AND CORRECT LINES.

MADHOUSE

An org that has no comm discipline is a madhouse. It will be expensive. It will produce very little. It will try to deliver overt products.

And it will drive its execs up the chimney.

The immediate result will be a conclusion on the part of the execs, "These blankety-blank-blanks are doing us in!" "The place is full of suppressive people." "These guys are no-good bums!" And "Start shooting."

Heavy ethics and offloads occur. These are almost always the result of a whole org gone around the bend from dev-t.

Accidents happen. People get ill.

And the place falls apart.

CURE

The only known cure is TRAINING and HATTING.

For years we underestimated the number of persons needed to train and hat a staff. The whole civilization has troubles because it hasn't even known about hatting, much less that it took someone to do it.

Any failure of HCO was caused by its drowning in dev-t, even at last generating it because it never had enough people devoted to training and hatting, getting in org lines and comm lines.

HCO can do its job relieved of the whole burden of hatting.

The solution is THE ESTABLISHMENT OFFICER.

This person operates in a division, not under its secretary but under a senior Establishment Officer.

He performs the duties of the departments of HCO for that division.

In a small org it requires a trained Establishment Officer for Divisions 7, 1 and 2 and another for Divisions 3, 4, 5 and 6.

In a larger org there is one in charge of all Establishment Officers and an Establishment Officer in each division.

As the org grows, the larger divisions get assistant Establishment Officers to the divisional one.

They do not establish and run away. They establish and maintain the division staff, personnel hats, posts, lines, materiel and supplies.

Their first job is to get staff working at their posts producing something and their next task is TO DRIVE DEV-T OUT OF EXISTENCE IN THAT ORG.

SUMMARY

The booms and depressions of orgs, their successes and fall-aparts are signaled by

CORRECT COMM — SUCCESS
DEV-T — FAILING.

The underlying cause is unhattedness.

So we are dealing in dev-t with a symptom. Like any disease it soon catches up with the body of the org and its health.

Dev-t is an expression of untrained, unhatted staff. It shows they do not do the functions of their posts regardless of how busy or exhausted they are.

And most important for an executive to know: There is seldom any malice in it. It is just confusion. Even new people or new execs coming into such an area all full of enthusiasm and bushy-tailed will cave in from the fantastic do-less motions of such an org.

Morale will be bad because PRODUCTION IS THE BASIS OF MORALE and who can produce in the midst of all that noise????

The place will go into apathy and tiredness as one is hit all day with OFF–LINE, OFF–ORIGIN COMM.

The executive's solution is to HAT HAT HAT and get help hatting hatting hatting, get the org board up and DRILL, DRILL, DRILLED. Demand demand demand the products of the post the person holds and only those products. And police his lines and get the dev-t in his own area handled handled handled and never never never pull dev-t blunders himself and ALWAYS ALWAYS ALWAYS DO AND INSIST UPON CORRECT COMM.

The solution is do what you can and all you can to hat and reduce dev-t and scream for an Establishment Officer to save the org.

CORRECT COMM IS THE SYMPTOM OF A HEALTHY, PRODUCING ORG AND A VALUABLE EXECUTIVE AND STAFF MEMBER.

HCO POLICY LETTER OF 1 APRIL 1972

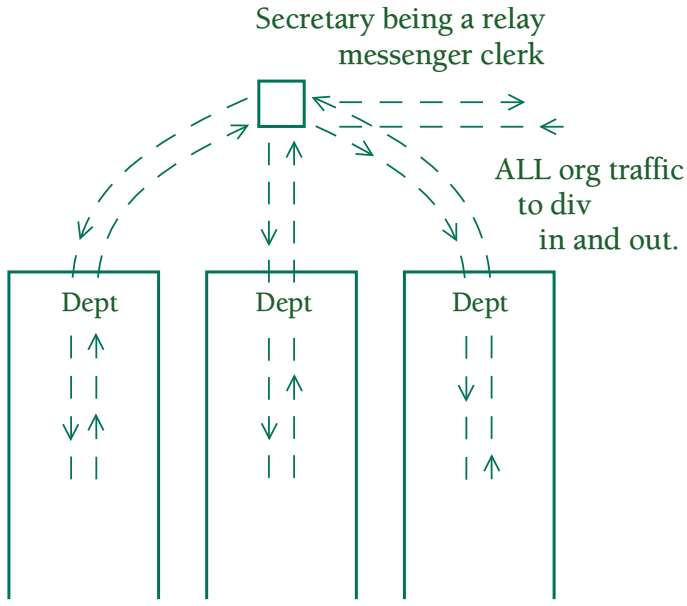
REMIMEO

EXECUTIVE SERIES 11
ESTABLISHMENT OFFICER SERIES 12

MAKING AN EXECUTIVE

FLOW LINES

If an executive has his flow lines wrong he will NEVER be a product officer but only a comm clerk.



For some poor reason executives get themselves onto all comm lines in their area. Probably it is an individual Why for each one. But the fact remains that they *do* do it!

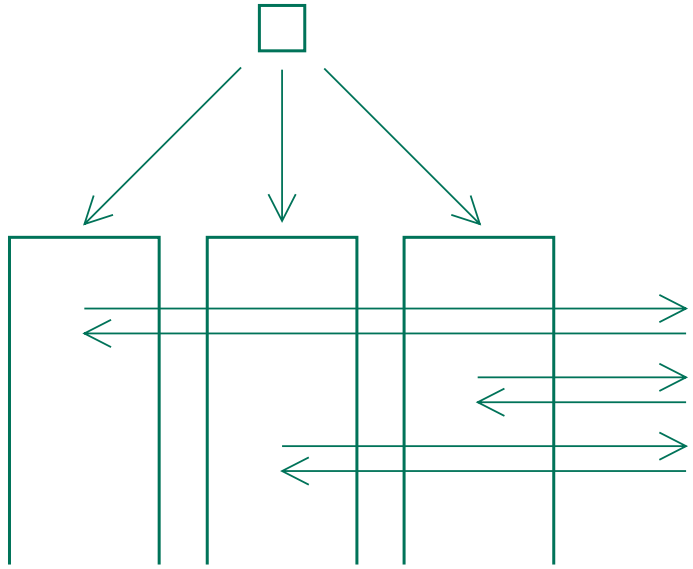
And they promptly cease to be useful to anyone. While they "work" like mad!

Basically *they have confused a comm line with a command line.* These are two different things. A comm line is the line on which particles flow, it is horizontal. A command line is a line on which authority flows. It is vertical.

Here is an example of a divisional secretary who can get nothing accomplished while sweating blood over her "work."

Wrong

Now quite obviously this secretary is suffering from "fear of juniors' actions" or "having to know all." Exactly nothing will happen because the person is plowed under with paper. No real actions are taken. Just relays.



One such secretary of a division even acted as the relay point on all out and in BODY traffic. In short, just a divisional receptionist.

No product. Nothing happening at vast expense.

Here is another example. The correct one.

Div secretary as product officer

Right

This is known as horizontal flow.

It is a fast flow system.

The correct terminals in each department are addressed by terminals outside the dept, directly. And are so answered.

Now we have a divisional secretary who is a PRODUCT OFFICER and whose duty is to get each department and section and unit producing what it is supposed to produce.

MISROUTE

So long as a command line is confused with the comm line an org will not produce much of anything but paper.

INFORMATION

It *is* vital that an executive keep himself informed.

The joker is, the despatch line does NOT keep him informed. It only absorbs his time and energy.

The data is not in those despatches.

The data an executive wants is in STATISTICS and REPORTS and briefings.

Statistics get posted and are kept up-to-date for anyone to look at, especially but not only the executive. They must ACCURATELY reflect production, volume, quality and viability.

Reports are summaries of areas or people or situations or conditions.

The sequence is (a) statistic goes unusually high, (b) an inspection or reports are required in order to evaluate it and reinforce it.

Or (a) the statistic dives a bit and (b) an inspection or reports are needed to evaluate and correct it.

Thus an executive is NOT dealing with the despatches or bodies of the division's inflow and outflow lines but the facts of the division's production in each section.

An executive makes sure he has comm lines, yes. But these are so he can make sure stats get collected and posted, so reports can be ordered or received and so he can receive or issue orders *about these situations.*

Despatchwise that is all an executive handles.

INSPECTIONS

Personally or by representative, an executive INSPECTS continually.

His main duties are:

OBSERVATION

EVALUATIONS (which includes handling orders)

and SUPERVISION.

All this adds up to the production of what the division is supposed to produce. Not an editing of its despatches.

A good executive is all over the place getting production done.

On a product he names it, wants it, gets it, gets it wanted, gets in the exchange for it.

He cannot do this without doing OBSERVATION by (1) stats, (2) reports, (3) inspections.

And he can't get at what's got it bugged without evaluation. And he can't evaluate without an idea of stats and reports and inspections.

Otherwise he won't know what to order in order to SUPERVISE. And once again he supervises on the basis of what he names, wants, gets, gets wanted and gets the exchange for.

THE SCENE

This *is* the scene of an executive.

If he is doing something else he will be a failure.

The scene is an active PRODUCTION SCENE where the executive is getting what's wanted and working out what will next be wanted.

ABILITY

An actual executive *can* work.

A real fireball can do any job he has getting done under him better than anyone he has working for him or under him.

He can't be kidded or lied to.

He *knows.*

Thus a wobble of a stat has him actively looking in the exact right place. And evaluating knowingly on reports. And getting the exact right WHY. And issuing the exact right orders. And seeing them get done. And knowing it's done right because he knows it can be done and how to do it.

Now that's an ideal scene for an exec.

But any exec can work up to it.

If he does a little bit on a lower job each day, "gets his hands dirty" as the saying goes, and masters the skill, he soon will know the whole area. If he schedules this as his 1400 to 1500 stint or some such time daily, he'll know them all soon. And if he burns the midnight oil catching up on his study.

And he *knows* he must watch stats and then rapidly get or do observations, so he can evaluate and find real Whys quickly and get the correction in and by supervision get the job done.

That's the ideal scene for the exec himself where he's head of the whole firm or a small part of it.

If he can't do it he will very likely hide himself on a relay despatch line and appear busy while it all crashes unattended.

An exec of course has his own admin to do but they don't spend hours at it or consider it their job for it surely isn't. Possibly an hour a day at the most handles despatches unless of course one doesn't police the dev-t in them.

Most of their evaluations are not written. They don't "go for approval" when they concern somebody's post jam. They are done by investigation on the spot and the handling is actual, not verbal.

A desk is used (a) to work out plans, (b) catch up the in-basket, (c) interview someone, (d) write up orders. Two-thirds of their time is devoted to production. Even if a thousand miles away they still only spend one-third of their time on despatches.

An executive has to be able to produce the real products and to get production. That defines even an Esto whose product has to do with an established person or thing.

Any department, any division, any org, any area responds the same way—favorably—to such competence.

ANALYSIS

To attain this ideal scene with an executive, one can find out WHY he isn't, by getting him to study this PL and then find WHY he can't really do it and then by programing him to remedy lack of know-how and other actions, increase his ability until he is a fireball.

If you are lucky you will have a fireball to begin with. But only the stats and *the truth of them* tell that!

Esto action: Can you do all this and these things? If the answer is no or doubtful or if the executive isn't doing them, find the Why and remedy.

L. RON HUBBARD
FOUNDER

HUBBARD COMMUNICATIONS OFFICE
SAINT HILL MANOR, EAST GRINSTEAD, SUSSEX

HCO POLICY LETTER OF 3 MAY 1972RA
REVISED 7 SEPTEMBER 2000

REMIMEO
EXECUTIVE HATS

IMPORTANT

EXECUTIVE SERIES 12

ETHICS AND EXECUTIVES

Any person holding an executive post (head of department or above) is deemed an EXECUTIVE.

Evaluation has revealed that the breakdown in many orgs is a failure on the part of executives to wear their ethics and justice hats.

It has been found that below administrative Whys there is usually an ethics situation as well, which unhandled causes the administrative Why not to function or raise stats.

In an area which is downstat, it is the duty of an executive to investigate and find any out-ethics situation and get it corrected.

Ethics is a personal thing in relation to a group. Unethical people are those who do not have ethics in on themselves personally.

It is the responsibility of the executive to see to it that persons under his control and in his area *get their personal ethics in and keep them in.*

Dishonesty, false reports, an out-ethics personal life, should be looked for and, by persuasion, should be corrected.

When an executive sees such things, he or she must do all he can to get the person to get his own ethics in.

When an area is downstat, the executive must at once suspect an out-ethics scene with one or more of the personnel and must investigate and persuade the person to be more honest and ethical and correct the out-ethics condition found.

If this does not correct and if the person or area remains downstat, the executive must declare the person or area in Danger and apply HCO PL 9 Apr. 72R, CORRECT DANGER CONDITION HANDLING.

The situation, if it does not correct, thereafter becomes a matter of full group justice with Courts and Comm Evs. Persons whose ethics have remained out must be replaced.

The seniors of an executive are bound to enforce this policy and to use it on any executives whose personal ethics are out and who fail to apply it. It will be found that those who do not apply this policy letter have themselves certain dishonesties or out-ethics situations.

IT IS VITAL TO ANY ORGANIZATION, TO BE STRONG AND EFFECTIVE, TO BE ETHICAL.

THE MOST IMPORTANT ZONE OF ETHICAL CONDUCT IN AN ORGANIZATION IS AT OR NEAR THE TOP.

Ethical failure, at the top or just below it, can destroy an organization and make it downstat.

Historical examples are many.

THEREFORE IT IS POLICY THAT AN EXECUTIVE MUST KEEP ETHICS IN ON HIMSELF AND THOSE BELOW HIM OR BE DISCIPLINED OR COMM EVED AND REMOVED FROM ANY POST OF AUTHORITY AND SOMEONE FOUND WHO IS HIMSELF ETHICAL AND CAN KEEP ETHICS IN ON THOSE UNDER HIS AUTHORITY.

The charge in any such case for a staff member or executive is FAILURE TO UPHOLD OR SET AN EXAMPLE OF HIGH ETHICAL STANDARDS.

Such offenses are composed of:

1. DISHONESTY,
2. Use of false statements to cover up a situation,
3. Representing a scene to be different than it actually is to cover up crimes and escape discipline,
4. Irregular 2D connections and practices,
5. Drug or alcoholic addiction,
6. Encouraging out-ethics,
7. Condoning or failing to effectively handle an out-ethics situation in self or others as an in-charge, officer or executive.

TECHNICAL

People with out-ethics withholds cannot see. This is proven by the brilliant return of perception of the environment in people audited effectively and at length on such processes.

Such people also seek to place a false environment there and actually see a false environment.

People whose ethics are low will enturbulate and upset a group as they are seeking to justify their harmful acts against the group. And this leads to more harmful acts.

Out-ethics people go rapidly into Treason against the group.

A person whose ethics have been out over a long period goes "out of valence." They are "not themselves."

Happiness is only attained by those who are HONEST with themselves and others.

A group prospers only when each member in it has his own personal ethics in.

Even in a PTS (potential trouble source) person there must have been out-ethics conduct toward the suppressive personality he or she is connected with for the person to have become PTS in the first place.

People who are physically ill are PTS *and are out-ethics* toward the person or thing they are PTS to!

Thus a group to be happy and well, and for the group to prosper and endure, its individual members must have their own ethics in.

It is up to the executive or officer to see that this is the case and to DO the actions necessary to make it come about and the group an ethical group.

EXEC OR OFFICER'S STEPS FOR GETTING IN ETHICS ON A STAFF MEMBER

STEP 1

Inform the person personally he is in Danger condition by reason of acts or omissions, down stats, false reports or absence or 2D or whatever the circumstances are.

He is in fact IN danger because somebody is going to act sooner or later to hit him.

He may be involved already in some other assignment of condition.

But this is between you and him.

HE IS IN DANGER BECAUSE YOU ARE HAVING TO BYPASS HIM TO GET HIS ETHICS IN, A THING HE SHOULD DO HIMSELF.

If he cooperates and completes this rundown and it comes out all right, you will help him.

If he doesn't cooperate you will have to use group justice procedures.

This is his chance to get ethics in on himself with your help before he really crashes.

When he accepts this fact, Step 1 is done. Go to Step 2.

STEP 2

Ethics is gotten in by definition on the person.

GET THE DEFINITIONS FULLY UNDERSTOOD.

The following words must be Method 4 word cleared on all the words and the words in their definitions on the person being handled.

"ETHICS: the study of the general nature of morals (morals [plural] [noun]: *the principles of right and wrong conduct) and the specific moral choices to be made by the individual in his relationship with others.*"

"The rules or standards governing the conduct of the members of a profession."

"JUSTICE: (1) moral rightness; equity. (2) honor, fairness. (3) good reason. (4) fair handling: due reward or treatment. (5) *the administration and procedure of the law*."

"FALSE: contrary to fact or truth; without grounds; incorrect. Without meaning or sincerity; deceiving. Not keeping faith. Treacherous. Resembling and being identified as a similar or related entity."

"DISHONEST: disposed to lie, cheat, defraud or deceive."

"PRETENSE: a false reason or excuse. A mere show without reality."

"BETRAY: to be disloyal or faithless to."

"OUT–ETHICS: an action or situation in which an individual is involved contrary to the ideals and best interests of his group. An act or situation or relationship contrary to the ethics standards, codes or ideals of the group or other members of the group. An act of omission or commission by an individual that could or has reduced the general effectiveness of a group or its other members. An individual act of omission or commission which impedes the general well-being of a group or impedes it in achieving its goals."

Do not go to Step 3 of this until all the above words are cleared by Method 4 Word Clearing.

STEP 3

Ask the person what out-ethics situation he or she is involved in.

It may take the person some time to think of it or he may suppress it and be afraid to say it for fear of consequences. Reassure him that you are only trying to help him.

He may have brought it up in a session but did not apply it as out-ethics. Coax him through this.

If his conduct and actions are poor or downstat, he for sure will be able to come up with an out-ethics personal scene.

Sometimes the person is secretly PTS and is connected to a suppressive or antagonistic person or group or thing. In such an instance he will roller-coaster as a case or on post or have accidents or be ill frequently. (See PTS tech for material on this

and for future handling HCO PL 9 Apr. 72R, CORRECT DANGER CONDITION HANDLING, but go on handling with these steps.)

Sometimes the person just uses PR (brags it up and won't come clean). In this case, an auditing session is required.

If the person gets involved in self-listing, get him audited on HCOB 20 Apr. 72 II, C/S Series 78, PRODUCT PURPOSE AND WHY AND W/C ERROR CORRECTION, which gives the auditing session procedure. A person can become very upset over a wrong item. It is easily repaired, but it *must* be repaired if this happens.

By your own 2WC or whatever means or repair get this Step 3 to a clear-cut out-ethics situation, clearly stated. Do not forget to go on with this eventually if there is a delay in completing it. GIs will be in if correct.

STEP 4

Have the person work out how the out-ethics situation in which he or she is involved would be a betrayal of the group or make them false to the group or its ideals.

Do not make the person guilty. Just get them to see it themselves.

When they have seen this clearly and have cognited on it completely, go to next step.

STEP 5

The person is now ready to apply the FIRST DYNAMIC DANGER FORMULA to himself.

Give him this formula and explain it to him.

FIRST DYNAMIC FORMULA

The formula is converted for the first dynamic to:

1st 1: Bypass habits or normal routines.

1st 2: Handle the situation and any danger in it.

1st 3: Assign self a Danger condition.

1st 4: Get in your own *personal ethics* by finding what you are doing that is out-ethics and use self-discipline to correct it and get honest and straight.

1st 5: Reorganize your life so that the dangerous situation is not continually happening to you.

1st 6: Formulate and adopt firm policy that will hereafter detect and prevent the same situation from continuing to occur.

Now, usually the person is already involved in another *group* situation of down stats or overt products or bad appearance or low conditions, Courts, Comm Evs for something.

NAVIGATE
FIRST PAGE
SEARCH
FIND
AGAIN
EXIT
CONTENTS
ORG BOARDS
INDEX

It does not matter what other condition he was in. From you he is in *Danger*.

So 1st 1 and 1st 2 above apply to the *group* situation he finds himself in.

He has to assign *himself* a Danger condition as he recognizes now he has been in danger from himself.

1st 4 has been begun by this rundown.

It is up to him or her to finish off 1st 4 by applying the material in Steps 2 and 3. He or she has to use self-discipline to correct his own out-ethics scene and get it honest and straight, with himself and the group.

1st 5 is obvious. If he doesn't, he will just crash again.

1st 6, in formulating and adopting firm policy he must be sure it aligns with the group endeavor.

When he has worked all this out AND DEMONSTRATED IT IN LIFE, he has completed the personal Danger Rundown.

He can then assign himself Emergency and follow the Emergency Formula (HCO PL 23 Sept. 67, NEW POST FORMULA, THE CONDITIONS FORMULAS, Vol 0 OEC, "Emergency").

STEP 6

Review the person and his stats and appearance and personal life.

Satisfy yourself that the steps above and the out-ethics found were all of it. That no wrong item has been found. That the person is not PTS.

Handle what you find. But if you find that the person did not improve and gave it all a brushoff, you must now take the group's point of view and administer group justice.

Your protection of the person is at end because he had his chance and is apparently one of those people who depend on others to keep his ethics in for him and can't keep them in himself. So use group justice procedures thereafter.

If the person made it and didn't fall on his head and is moving on up now AS SHOWN BY HONEST STATS AND CONDITION OF HIS POST, you have had a nice win and things will go much much better.

And that's a win for everybody.

HCO POLICY LETTER OF 12 MAY 1972R
REVISED 27 OCTOBER 1982

REMIMEO
INT FINANCE NETWORK
FOR ENFORCEMENT

ETHICS

EXECUTIVE SERIES 13
PERSONNEL SERIES 25
FINANCE SERIES 12

PTS PERSONNEL AND FINANCE

PTS means Potential Trouble Source. This is a person who is connected to a suppressive person, group or thing. (For further data on PTSness see HCOB 24 Nov. 65, SEARCH AND DISCOVERY, and HCO PL 27 Oct. 64, POLICIES ON PHYSICAL HEALING, INSANITY AND SOURCES OF TROUBLE.)

NCG means No Case Gain despite good and sufficient auditing.

A chronically ill person, whether the person is known to be connected to a suppressive or not, is always found to have been so connected and PTS.

IT IS UNSHAKABLE POLICY HEREAFTER THAT NO PERSON WHO IS PTS OR CHRONICALLY ILL OR WHO GETS NO CASE GAIN MAY BE ON FINANCE OR REGISTRAR LINES OR IN TOP COMMAND POSTS OR AS HAS OR ETHICS OFFICER OR MAA.

TECHNICAL FACT

A person who is connected to a suppressive person, group or thing will dramatize a "can't-have" or an "enforced overt-have" on an org or staff members.

A "can't-have" means just that — a depriving of substance or action or things.

An "enforced overt-have" means forcing upon another a substance, action or thing not wanted or refused by the other.

The technical fact is that a PTS person got that way because the suppressive *was* suppressive by depriving the other or enforcing unwanted things upon the person.

The PTS person will dramatize this characteristic in reaction to the suppression.

Therefore, a PTS person as an ED, CO, product officer, org officer, Treasury Sec, Cashier or Body Reg will run a can't-have on the org and its staff by:

a. Refusing income,

b. Wasting income made,

c. Accepting wrong customers (like psychos) and forcing them on the org,

d. Fail to provide staff or service,

e. Advocate overt products.

HISTORICAL

When staffs went on proportionate pay in the late 1950s, so long as I ran the orgs directly the staffs made more money than before.

When I moved off these lines directly, the staffs began to receive less money personally.

At that time it seemed to me that proportionate pay served as an excuse to some in an org to run a can't-have on the staff.

We knew that some Registrars could take money in easily and others never seemed to be able to.

The technical reason for this has just emerged in another line of research entirely.

In completing materials and search on Expanded Dianetics, I was working on the mechanism of how a PTS person remained ill.

I found suppressives became so to the person by running a "can't-have" and "enforced overt-have." This pinned the PTS person to the suppressive.

Working further I found that a PTS person was a robot to the suppressive. (See HCOB 10 May 72, ROBOTISM)

This research was in the direction of making people well.

Suddenly it was apparent that a PTS person, as a robot to SPs, will run "can't-haves" and "enforced overt-haves" on others.

Checking rapidly, it was found that where finance lines were very sour a PTS person was on those lines.

RECOVERY

PTS tech, Objective Processes, PTS Rundowns, Money Processes and Expanded Dianetics will handle the condition.

However, one cannot be sure that it has been handled expertly in orgs where a money "can't-have" has been run as its tech quality will be low due to an already existing lack of finance.

Only stats would tell if the situation has been handled fully.

Thus the policy stands. Handled or not handled, no person who is PTS or who has no case gain will be permitted in top command or any lines that influence finance.

Any org which has consistently low income should be at once suspect of having PTS or NCG persons on the key finance posts, and an immediate action should be

taken to discover the PTS or NCG condition and replace such persons with those who are not connected to suppressives or who do get case gain.

Nothing in this policy letter permits *any* PTS person to be in an org or cancels any policy with regard to PTS.

This policy letter *requires* direct check, close investigation and handling of PTS or SP situations on these posts that may go undetected otherwise.

NOTHING IN THIS POLICY LETTER PERMITS ANY KEY ORG POST TO REMAIN EMPTY.

NATIONAL

As a comment on something that may impinge on orgs and might affect them, the FOREMOST reason for a failing national prosperity and inflation is a personal income tax agency. This runs a vicious can't-have on every citizen and makes them PTS to the government. Individuals even begin to run a can't-have on themselves and do not produce. This IS the cause of a failing national economy. It can be a factor in an org and must be handled on the individuals so affected.

ESTO FAILURES

For several months I have been studying the Esto system in operation and have finally isolated the exact points of any failures so they can be turned to successes.

PUTTING IN THE SYSTEM

An Esto returning to an org can crash it.

The exact reasons for this are:

A. The execs who heretofore did organizational work say, "Ah, here's the Esto system at last," and promptly drop their organizational and personnel actions.

Yet here is this lone E Esto, no divisional Estos, no one trained to support him.

The right answer is when an E Esto goes into an org where there are no Estos or only a TEO or QEO, he must gather up the execs and tell them it will take him weeks to recruit and train Estos and that THEY MUST CONTINUE ANY ORGANIZATIONAL ACTIONS THEY ARE DOING and that the HAS IS STILL ESTABLISHING THE ORG.

Otherwise they let go their lines.

B. The new E Esto takes key production personnel from the divisions to be Estos and they crash.

The answer to this is to RECRUIT the new Estos.

This is easier than it looks if you recruit idle area *auditors* to be Estos.

If you do this, remember that they went idle as auditors because they had out-ethics, were PTS, had misunderstoods and out-TR 0. To get them you do a 3 May 72 (ETHICS AND EXECUTIVES) PL, a 5 Apr. 72 (PTS TYPE A HANDLING) PL, Method 4 on their courses and make them do *real* TRs, especially zero. And they'll be ready.

You get a list of area auditors and contact them and do the above on them and you'll have Estos who are half-trained already.

Failing this or in addition to it just plain recruit.

C. The first post a new E Esto should take is Dept 1.

He does NOT "hat the HAS" or "just do programs." He rolls up his sleeves and WORKS as director of Dept 1.

He recruits, he posts up Dept 1. He hats the hell out of Dept 1.

He makes a Department 1 that really, really flows in personnel, puts up org boards and hats.

WHEN he has a Department 1 FUNCTIONING he can begin to recruit Estos as well as other org staff.

If he can't get a Dept 1 whizzing he has no business being an Esto, does he?

He does NOT put in Dept 2 or act as Dept 3. He makes the HAS handle these.

With a *strong working* Dept 1, an Esto system can then go in.

D. Musical chairs is the commonest reason any org collapses.

A "new broom sweeps clean" complex will wreck any org.

An E Esto on arrival, taking over Dept 1, FREEZES ALL PERSONNEL TRANSFERS. He does not permit even one transfer.

The only exception would be where a musical chair insanity has just occurred. If this was followed by a stat crash then one REVERTS THE ORG TO THE UPSTAT PERIOD and *then* FREEZES PERSONNEL TRANSFERS.

But before one reverts one must evaluate the earlier period by stats to be sure it WAS the upstat period.

By freezing personnel one protects what he is building.

Almost all musical chairing is the work of a suppressive except when it is the work of an idiot.

E. Anyone trying to hold Dept 1 in a personnel starved org is holding a hot seat as any HAS or Personnel Director can tell you.

Body traffic to this dept in any medium-sized org defies belief.

It looks like Grand Central Station at the rush hour.

"I have to have _____," "Where is my Course Super _____?" etc., etc., etc., is the constant chant.

You can spend the whole day interviewing staff execs and get nothing done.

There is a right way to do all these things and a billion wrong ways.

Obviously the answer to all their problems is to get and train new people. Yet how can one in all the commotion.

Ninety percent of these requests are from people who are not hatting and using the people they already have.

The right way is on any new personnel demanded one gets Dept 3 to do an Inspection and Report Form for people in the area of the exec doing the demanding. You will find very often unhatted, untrained and wasted personnel and many outnesses.

You hold the line on personnel by saying: "Handle these unutilized or half-working staff or these outnesses. You are here on my procurement board as entitled to the (give priority, 3rd, 8th) person we hire or recruit."

And get industrious in recruiting, using all standard actions, for that is the only way things can be solved.

Most orgs would run better on less people because the personnel are not hatted or trained. One org, two years before this writing, made *four* times as much money on *half* the personnel it now has.

Unhatted, the staff is slow and uncertain. Unproducing, the div heads demand little.

But they sure can scream for more personnel!

No org ever believes it is overmanned.

F. Some divisions (like the usual Treasury or Dissem) can be undermanned. Key income posts most often are empty.

When one mans up an org one sets priorities of who gets personnel.

This is done by PRODUCTION paralleling. One mans up against production.

New people come in through Div 6. They are signed up by Div 2. Delivery is done by Div 4. Money is collected by Div 3. That gives you a sequence of manning up.

You man income and delivery posts with new hirings.

The E Esto is trying to get in a Dept 1 so of course he gives this a priority as well.

Until the income is really rolling in and the delivery rolling out, one does very little about other areas.

Having gained VOLUME, one now begins to man up for quality. This means a Cramming and a W/C Section in Qual. It means more HCO.

One now hits for future quantity by getting auditors in training, more upper execs in training.

When the org is so built and running and viable it is time the whole Esto system got manned up.

G. Every 5th person hired on an average should be put in Dept 1 as a *Dept 1* extra personnel who does Dept 1 duties and trains part time as an Esto.

This gives the E Esto additional personnel in Dept 1.

It also begins an Esto right.

His most essential duties as an Esto *are* Dept 1 type duties.

You eventually have a bulging Dept 1. You have a basic Dept 1 that functions well and will continue so. You have the Esto trainees who are working in Dept 1 as Dept 1 personnel. And you have of course some new people who are HCO Expeditors until they get in enough basics for real regular posting.

This makes a fat Dept 1 and proves one can Esto!

SUCCESS

If an E Esto introduces the Esto system exactly as above and in no other way, he will be a success.

Like an auditor varying processes or altering HCOBs, a new E Esto who varies the above will bring about disaster.

Where E Estos have gone into orgs other ways or where the system has been varied, stats have crashed.

By going in this way, as above, it can be a wild success.

How fast can you put in an Esto system? It takes months of hard work. It depends really on how good the E Esto is at recruiting, org boarding and hatting.

If he's good at these things the time does not stretch out to forever.

For comparison, it took half a year each to build DC, Johannesburg and SH to their highest peaks. They were all built from a Dept 1 viewpoint of recruiting, org boarding and hatting hard enough to get production.

So this is the oldest pattern we have — Dept 1 evolves the org.

When the org gets too big Dept 1 loses touch. You extend it into each div and you have the Esto system. And you have Estos.

ESTABLISHMENT OFFICER SERIES 23

THE VITAL NECESSITY OF HATTING

On a graph analysis of past stats, my campaign on hatting where a hat was a checksheet and pack apparently introduced a steady rise of the International Gross Income.

Studying this further I discovered a new basic, simple fact:

HATTING = CONTROL

A person who is hatted can control his post.

If he can control his post he can hold his position in space — in short, his location. And this is power.

When a person is uncertain, he cannot control his post, he cannot control his position. He feels weak. He goes slow.

If he can control his post and its actions he feels confident. He can work effectively and rapidly.

The key is CONTROL.

Control is the ability to START, CHANGE and STOP.

When he is hatted he knows the tech of HANDLING things. Thus he can control them. He is at CAUSE over his area.

If you have an org composed only of weak wobbly posts, they tend to collapse in on each other. There is no POWER.

The org then cannot be CAUSE over its environment because it is composed of parts which are not cause. The whole is only the sum of its parts.

If all the parts are each one at cause, then the whole will be at CAUSE over its environment.

Only an org at CAUSE can reach and CONTROL.

Thus a fully hatted org can be at cause over its environment, can reach and control its fates and fortunes.

THUS THE PRIMARY TARGETS OF AN ESTO ARE:

A. ESTABLISHED ORG FORM and

B. FULLY HATTED PERSONNEL.

BASIC SEQUENCE OF HATTING

1. Recruited or hired. Signs contract.
2. Instant-hatted for the job assigned as an HCO Expeditor.
3. Staff Status 0.
4. Basic Study Manual (if the staff member has not previously done the Student Hat or Primary Rundown).
5. Staff Status I.
6. Staff Status II.
7. Posting as other than an HCO Expeditor.
8. Full hatting with a checksheet and pack fully done with M6, M7, M9, M3 and M4 Word Clearing.
9. Eligibility for study and auditing (OR for staff service or study).
10. Must have a stat and demonstrated he has produced on post.
11. Purification Rundown.
12. Objective Processes: CCHs, 8-C, SCS, Havingness, etc.
13. Scientology Drug Rundown (if required).
14. Method One Word Clearing, Student Hat.
15. Administrative or tech training (OEC or auditing).

Flag Orders in the Sea Org may change this lineup slightly but it is basically the same.

No one should have any other training, much less full-time training, before step 12 in the above.

After a staff member has completed Staff Status 0 he may receive PTS handlings and study the PTS checksheet and may have emergency assists. He may also be audited by students and TTC if he has rising stats.

There are time limits placed on how long it takes to do SS I and SS II. A person who can't make it is routed to Qual where he is offloaded with advice on how to get more employable. (In the SO it is Fitness Board.)

TIME–TESTED

The above is the route that has been tested by time and found good.

Other approaches have NOT worked.

Granting full-time training at once is folly. The person may get trained but he'll never be a staff member. This is the biggest failure with auditors — they don't know the org. Admin training with no org experience to relate it to is a waste of time.

This was how we built every great org. And when it dropped out the org became far less powerful.

Old-timers talk of these great orgs in their great days. And they will tell you all about the org boarding and hatting that went on. How the Hatting Officer in HCO and the Staff Training Officer in Qual worked as a team. And how fast the lines flew.

The above steps have stood the test of time and are proven by stats.

RECRUITING AND HIRING

You *never* recruit with a promise of free courses or free auditing. Not even HASes or HQSes. You recruit or hire somebody to be part of the team.

OPEN GATE

If *any* opinion or selection is permitted as to who is going to be let on staff, *all* recruitment and hiring will fail.

By actual stats when you let *anyone* say, "No! Not him! Not her!" the gate shuts, the flow stops. And you've had it.

Requirements and eligibility *fail*. The proof is that when they have existed in orgs, the org wound up with only PTSes and no-case-gains!

The right answer is FAST FLOW hiring. Then you have so many that those who can't make it drift low on the org board or off. You aren't trying to hold posts with unqualified people "who can't be spared."

In a short-staffed org "looking only for the best people" the guy nobody will have gets put in an empty "unimportant" department. He's now a Director!

It only happened because you didn't have dozens.

The answer is NOT lock the gate or have requirements. The answer is HAT.

An org that isn't hatted goes weak and criminal.

Don't be selective in hiring or recruiting. Open the gates and *HAT!*

Follow the steps given above and you have it.

Don't spend coins like training or auditing (or travel) on people until they have proven their worth. No bonuses or high pay for anyone until they have reached and attained step 10 (a good stat). The cost of such fast flow hiring is not then a big factor.

The only trouble I ever had with this was getting div heads to UTILIZE their staff. A FIRST JOB FOR AN EXECUTIVE IS TO GET THINGS FOR HIS PEOPLE TO DO. AND KEEP THEM BUSY AT PRODUCTIVE THINGS.

So I used to have to go through the org that did FAST FLOW HIRING regularly and get people to use their new people. And to move off those who could not work.

This was ALL the trouble I had with the system.

And until I enforced FAST FLOW HIRING there was always some effort by someone to close the gate.

ALL the great executives in Scientology came up in such orgs.

With a *flow* of people the best move on up. The worst, if any, drop off.

Only orgs with restricted hiring or recruiting give trouble.

IN A FAST FLOW HIRING ORG THE HAS AND ESTOs *MUST* BE ON THE BALL. THE BREAKDOWN OCCURS WHEN THEY DO NOT *HAT* AND KEEP ON TOP OF THE PERSONNEL SCENE.

Fast flow hiring only breaks down and gets protested where HCO and Estos are not doing a top job. They have to really *handle* the personnel, post them, hat them, keep the form of the org.

A fully formed org in a heavily populated location would need hundreds of staff. It would make hundreds of thousands.

But only if it is fast flow hiring, hatting, holding the form of the org, and only then could it produce.

HCO POLICY LETTER OF 28 JULY 1972

REMIMEO

EXECUTIVE SERIES 16
ORG SERIES 32
ESTABLISHMENT OFFICER SERIES 26

ESTABLISHING
HOLDING THE FORM OF THE ORG

If a person who could not play a piano sat down at a piano and hit random keys, he would not get any harmony. He would get noise.

If the head of a division gave orders to his staff without any regard to their assigned posts or duties, the result would be confusion and noise.

That's why we say a division head "doesn't know how to play the piano" when he knows so little about org form that he continually violates it by giving his various staff members duties that do not match their hats or posts.

But even if one could play the piano, one would have to have a piano to play.

SPECIALISTS

Each org staff member is a specialist in one or more similar functions. These are his specialties.

If he is fully trained to do these he is said to be HATTED.

The combined specialties properly placed and being done add up to the full production of an org.

The org form is then the lines and actions and spaces and flows worked out and controlled by specialists in each individual function.

These specialists are grouped in departments which have certain actions in common.

The departments having similar functions are grouped into divisions.

The divisions combine into the whole org form.

It is *far* less complex than it looks. It would be very complicated and confusing if there weren't divisions and departments and specialized actions. Without these you would get noise and very limited production and income, and at great strain.

Take a theater as an example. There are people who advertise it; these are the public relations people; they are hatted to get publicity and make people want to come to the play; call them the PR Division. There are the producers and directors; they are hatted to present a performance and make it occur; call them the Production Division. There are the actors and musicians; call them the Artists Division. There are the property men; they are hatted to get costumes and items needed; call them the Property Division. There are the stagehands and electricians and curtain and set men; call them the Stage Division. There are the ticket sellers and money handlers and payroll and bills payers; they are hatted on money and selling; call them the Finance Division. There are the people who clean the theater and show people to seats and handle the crowds; call them the House Division. And there are the managers and playwrights and score writers and angels (financiers); call them loosely the Executive Division.

Now as long as they know their org board, have their flows plotted out, are hatted for their jobs and do a good job, even a half-good play can be viable.

But throw away the org board, skip the flows, don't hat them and even a brilliant script and marvelous music will play to an empty house and go broke.

Why? Because an org form is not held. Possibly an untrained unhatted producer will try to make the stagehands sell tickets, the actors write the music, the financiers show people to their seats. If he didn't know who the people were or what their hats were he might do just that.

And there would be noise and confusion even where there was no protest. People would get in one another's road. And the general presentation would look so ragged to the public they'd stay away in droves.

ESTO ACTION

Now what would an Esto (or an Executive Director) have to do with, let us say, an amateur, dilettante theatrical company that was about to bog.

Probably half the people had quit already. And even if there were people in the company they would probably need more.

The very first action would be to Esto Series 16 the top men to make money quick.

The first organizing action would be to kick open the hiring door. This would begin with getting out hiring PR and putting someone there to sign people up who came to be hired (not to test and audition and look at references, but just to sign people up).

The next action would be to do a flow plan of public bodies and money. So one sees where the org form reaches. Then a schedule.

Next action would be to do an org board. Not a 3-week job. (It takes me a couple hours to sketch one with a sign pen for posting.) AND GET IT POSTED.

One then takes the *head* of each of these divisions and *hats* him on what his division is supposed to do and tell him to *do* it. NOW.

You make and post the flow plan, org bd and terminal locations plan where the whole company can see them.

Chinese drill on a flow plan to show them what they're doing and what has to be done.

Chinese drill on the org board including introducing each person named on it and getting it drilled, what he does and who he is.

You Chinese drill the terminal locations where each of these persons (and functions) is to be found.

You get agreement on schedules.

You now have a group that knows who specializes in what and what's expected of each.

You get the head of the whole company to work with and hat the heads of his divisions.

Now you get the heads of divisions to hat their own staffs while you help.

And you get them busy.

You then put the polishing touches on your own Dept 1 (personnel PR, personnel hiring, personnel placement, org bds, hat compilations, hat library and hatting, hatting, hatting).

And by hatting and insisting on each doing his specialized job and getting seniors to HOLD THE FORM OF THE ORG by ordering the right orders to the right specialists and targeting their production and MAGIC! This amateur theatrical company gets solvent and good enough to wind up on Broadway. It's gone professional!

You say, yes, but what about artistic quality? What about the tech of writing music and acting . . .

Hey, you overlooked the first action. You kicked the door open on hiring and you hatted and trained. And you let go those who couldn't get a stat.

Eventually you would meet human reaction and emotion and would put in a full HCO and a full Qual particularly Cramming. But you'd still do that just to be sure it kept going.

Yessir, it can't help but become a professional group IF you, the Esto, established and made them HOLD THE FORM OF THE ORG and produce while they did it.

An Executive Director can do all this and produce too. The great ones do things like this. But here it is in full view.

A Scientology org goes together just like that. Which could be why, when we want to get something started, we say:

"Get the show on the road!"

But there is no show until it is established and the FORM OF THE ORG is held.

You are luckier than the amateur theatrical company's Esto. You have policy for every post and a book of it for every division and all the tech besides.

So there is no valid reason under the sun you cannot establish and then hold the form of the org.

ORG SERIES 35

THE STAT PUSH

WHAT exactly is a stat push?

The danger in talking about this subject at all is that someone can do an immediate make-wrong by saying, "This means don't try to raise any stats."

So to understand this subject at all, one must have a pretty clear idea of exactly what is meant by "Don't push stats."

First of all one has to know precisely that STATISTICS ARE AN INDICATOR, THEY ARE NOT AN OBJECT.

WHEN YOU PUSH THE INDICATOR YOU DO NOT OBTAIN THE OBJECT IT REPRESENTS.

PRODUCTION IS COMPLETED CYCLES OF ACTION, NOT JUST NUMBERS.

The figure "1" in "1 apple" is not the apple.

Therefore pure, raw, naked stat pushing is an outpoint called "wrong target."

Pushing a stat without doing anything to bring about the stat is therefore an aberration.

Demanding a stat without doing anything to see that it occurs or putting anything there to make it or correcting anything that is preventing it is an aberration built out of either psychosis or ignorance of what should really be done.

It is quite true that stats must be kept up. But unless they are kept up by putting something there or correcting something that is there and getting all the cycles of actions done by all those who should do them, the stats will DECREASE and eventually vanish.

An order, a telex, a yell to the effect "GET THE STATS UP" is so much wasted time.

Further, such an order or telex or yell in any form has a very deteriorating effect. Individuals or staffs look at it in a properly weird light. They are there, they are doing what they can, they have problems and tangles and barriers. And telling them to "Get the stats up" causes various reactions, none of them very good. Essentially, it gives

them neither help nor direction and even subtly informs them that the person ordering either does not know or does not care what is going on and is not about to help. The eventual reaction can become an ignoring of that command channel.

There are some specialized actions in stat pushing. Chief amongst them is the "GI push."

The usual indicator of this is a neglect or abandonment of staff or caring about staff. One sees no real effective attention on recruitment, training, apprenticing, hatting, future execs. And when one sees this it usually follows that there is a "GI push" going on somewhere in the executive strata. Why this indicator? Well, you see, it only takes a small handful of people to get in GI, and where executive attention is fixated on a "GI push," the various production staff, HCO and the rest of the org aren't "necessary." You find this with EDs who reg instead of getting Registrars and putting an org there, with EDs who go for credit unions and odd financial deals. And you will also find they have the biggest number and amount of refunds and the biggest backlogs AND a shrinking and unhappy org. Unfortunately, they soon also get a crashing GI, for none of the support actions are being done across the divisions.

The reason "GI pushing" happens so often is the structure of the society itself. The only real crime for which one can be punished by the governments of today is lack of money. In other crimes if one has the huge sums necessary to hire lawyers, one can often get off. But the crime of having no money is the only crime one cannot get out of. There are even laws which cause the arrest on the street of persons who do not have so much money in their pockets or wallets: it is called "vagrancy." So with the whole aberrated society on a big "GI push," with Wall Street measuring values only in how much something costs, with wages and prices soaring, at this writing, to total social disaster, it is no wonder that shortsighted and untrained or even aberrated executives get into a "GI push."

The answer to not having money is, of course, to make more money. And there is nothing whatever wrong with that. BUT that is *not* done with a "GI push." It is done with putting a whole org there, every part of it functioning and delivering, with all the bugs out of its lines, *and* making a lot, lot, lot more money. Fifty trained staff producing everything an org is supposed to produce will make far more money than five guys concentrating on GI only and letting the rest of the org go to blazes. The GI made by the fifty will go on increasing. The GI made by the five (and not backed up by the rest of the org) will decrease week by week and then crash.

Let us take some examples of "stat pushing":

The room is cold and the staff is wearing overcoats and using blankets. Mr. Stat Pusher walks over to the thermometer on the wall and sees that it reads very low. So he yells at the thermometer, "Get the stat up!" Nothing happens of course, it still says 15 degrees, so he yells at the staff, "Get that stat up!" Now, in this instance, having a stat pusher around, the org has no Treasury Div and so there was nobody to pay the bills and the fuel company has refused to deliver further fuel. The janitor is missing because there is no HCO to hire one or keep one on post so there's no one to light the furnace even if it had fuel. And due to an unhatted Financial Planning Committee, that also doesn't meet or exist, no new boiler was ordered when the old one blew up last year. The stat pusher seems incapable of observing these facts, and is too unskilled

to bring them to rights. So he continues to yell "Get the stat up" and the staff wears more and more coats and blankets until at last it is just a quiet scene of solid ice.

If the letters out stat is down, this is a bad INDICATOR. It is vital that one keeps stats and observes when one goes down. It is extremely hard to manage on one's post or in an org unless one has a stat. But, in going down, WHAT is being indicated? A lack of letters out. So what does one do? Does he yell "Get the letters stat up"? Or does he look into this? If he looked into it, he could find the real Why, handle it and the letters stat would go up. He might find that the Letter Reges were all sacked so as to increase the unit pay one week and that he has somehow gotten a nut onto a personnel or finance post (whose R/Ses make even his head jerk back and forth). He might find that the typewriters had broken down. He might find that Dept 5 people were all being used by Div 5 to handle their files. At the very least he will find something aberrated or ignorant going on which has to be handled before the letters can be flooded out again. WHEN this is found and handled, THEN the letters out stat will go up.

So Mr. Stat Pusher is essentially operating on a short circuit. He cannot or will not look.

And there is another variety of stat aberration which comes about after a lot of "Get the stat up" has failed. This is Mr. Stat Ignorer.

Mr. Stat Ignorer is driving along in a car and he looks at the speedometer. It says 15 mph. He glares at the needle for a moment and then handles it. He pastes a piece of paper over it so it can't be seen. And sits back and drives contentedly. If he'd looked, he would have found he had three flat tires and an engine about to run out of oil and explode.

Then there is also Mr. Stat Faker. He knows that he will get in trouble if his STAT is down. So he simply dreams up a figure and puts it on graph paper. He is encouraged and rendered confident in this because he is sure that no senior will come around and notice the towers of unanswered letters or the huge backlogs of cramming orders or the mobbed waiting room of unhandled public or the mountain of uncorrected and unfiled address plates. He is confident because no senior has in the last year or two. And he can say "I'm an upstat" when the Ethics Officer tries to hit him for keeping the front door to the org obstructed with his motorcycle. And he is recognizable by a caved-in case, low morale and a hunted look of glee as he creeps through the org.

There is one common denominator the stat pusher, the stat ignorer and the stat faker have. And that is AN ABSENCE OF SKILLED MANAGEMENT.

We have investigatory tech. It is there for use. We have the Data Series evaluation tech. It is there for use. We have administrative tech. And it is all published and there for use. And further, when it *is* known and used, proven times without number now, production and prosperity occur AND show up as statistics which INDICATE that production and prosperity are occurring.

Yes, it is very, very true that an org or a manager or an auditor or file clerk gets in trouble if their stats are down.

Yes, it is true that stats should exist and be used.

But it is equally true that the way to get a stat is to put something there that can get something done and get the lines debugged and the scene handled.

The fate of the stat pusher, the stat ignorer and the stat faker is to look around one day and find no org.

It's a very long way between yelling or telexing or writing "Get the stat up" and handling things and getting production cycles completed so that the stat WILL go up.

The stat, properly stated and honestly kept, IS a vital indicator of the scene. If you know how to use them you can get the areas that have to be handled. And if you know your policy and tech you can find the real Whys and get real handlings and get things whizzing.

We mean to have all the stats going up because this INDICATES a bettering state of affairs for everyone.

The job of the product officer is NOT to yell "Get the stats up." The product officer is there to notice and order things like "Get those letters answered so they get answers." And the job of the org officer is to carry out the handlings the product officer finds necessary to get production rolling.

A fire-breathing product officer is worth his weight to every staff member IF he is trying to get and is getting production which results in bettered conditions, better products, better prosperity and THIS will incidentally show up in the stats.

It's a world of things that have to be done and coordinated before the stats go up.

We are in the business of people, we are in the business of a bettered world. We have to have completed cycles of action. And these are shown in stats.

We are also in a world of exchange and would be no matter what ideology we lived under. We have to "make GI" and we have to have "the stats up."

But our success is measured in terms of the ACTIONS we do, for only those show up in the indicators called statistics.

So, okay. Let's go about it the right way. And find what is holding the stats down and handle and correct those things and so, honestly and swiftly become upstat.

STAT PUSH CLARIFIED

This policy letter is revised. The second paragraph of the original said that it was dangerous to talk about the subject because somebody could do an immediate make-wrong by saying, "This means don't try to raise any stats."

Well, exactly that happened. There was a heavy campaign run into all Flag Operations Liaison Offices and to orgs designed to discredit asking for raises in stats. (The person who did it and failed to push production quotas is suspended and under Comm Ev.)

The whole point seems to have been missed. It was this: You can't ask for a NUMBER; you CAN and MUST ask for a SOMETHING.

That something is a *product*. It is a thing, a tangible item.

Right this minute, as a result of a mission, HCO PL 16 Nov. 76, Exec Series 19, Org Series 37, PRODUCTION QUOTAS, has now been provided with thoroughly researched subproducts one has to push in order to get the PRODUCTS. These are the real tangible actions you have to take to get a number of actual products. In other words, by getting many exact minor products, you then can achieve the valuable final product.

STATISTICS are those numbers which simply count the products attained or obtained.

Stat management is the only kind of management you can do on a production scene. Management by statistics was brought to a fine art in Scientology admin tech. To discredit it is, of course, to court failure.

Abusing statistical management is also something of a crime. It has been done by some managers who said "Get the stats up" without ever saying what subproducts you had to get that would then make up the product.

Stat management is a valuable tool and has gotten us over the years. To discredit it first by saying first just "Get the stats up" without saying how or what or why was one side of the pendulum. Then the pendulum swung clear to the extreme and people were being made guilty for even watching stats or demanding or working to raise them.

So let's get a little middle swing of the pendulum now.

It is perfectly all right to demand that stats rise so long as one says what subproducts and products make up those stats and gives some indication of what people should do to get the stats rising.

It is perfectly all right to do stat management.

And it is perfectly okay to come down hard on people or orgs who fail to get their stats in viable range.

So long as you give them some idea of what small products (subproducts) they have to get to make up the real products, you are NOT doing a stat push.

So long as you give people some direction and guidance, you can yell for stat increases all you want.

And you better.

ORG SERIES 36

MANNING UP AN ORG

THE SEQUENCE OF POSTING DEPTS AND DIVS

You need an org board first and an allocation board.

The sequence in which an org is manned up is roughly:

– Dept 1

– Dept 11

– Reg and Body Routers and Intro people in Div 6

– Dept 12 (enough auditors and C/Ses to approach 2 admin to 1 tech in org)

– Dept 6

– Dept 7

– Dept 3

– SSO and Supers in Qual to train staff

– Dept 5 for CF, Address and Letter Reges

– Dept 4 for promo

– Dept 21 (LRH Comm)

– Dept 10

– Dept 20

– FR and execs

– Full Div 6

– Full Div 1

– Full Div 4

– Full Div 2

– Full Div 5

– Full Div 7

– Full Div 3

(Note, an AO always mans up the AO Dept or Div along with the SH one in each case.)

Wrong sequence of manning is Dept 6, Dept 12, Dept 6, Dept 12, Dept 6, Dept 12, as you wind up with a stuck clinic that won't expand.

Wrong sequence will contract an org while trying to expand it, as the org will go out of balance, bad units, noisy and unproductive.

If manned in a correct sequence, its income has a chance to stay abreast of its new staff additions.

Emphasis on GI without comparable emphasis on delivery and organization can throw an org into such a spin only a genius can run it.

Manned in proper sequence, and hatted as it goes, an org almost runs itself.

Single handing from the top comes from long-standing failures to man or man in sequence, from earlier noncompliance with explicit orders or from not understanding orgs in the first place.

An unhappy org that doesn't produce has usually been manned only partially and out of sequence.

The trick is planned manning, ignoring the screams of those who know best or demand personnel; just manning by posting those who have been screamed for the loudest is a sure way to wind up with no people and total org problems instead of a total org that is prosperous and producing.

Incidentally, this is a rough approximation of the sequence of hats the ED gradually unloads as his org takes over.

PRODUCTION QUOTAS

Ref: HCO PL 8 Feb. 72 — Exec Series 7
TARGETING OF DIVISIONAL
STATISTICS AND QUOTAS

In a recent pilot, executed at my orders by the Staff Captain, it was found that:

WHERE A STAFF MEMBER DOES NOT KNOW THE SUBPRODUCTS WHICH GO TO MAKE UP A GROSS DIVISIONAL STATISTIC THE GDS WILL SUFFER AND FALL.

And it was also found:

WHERE SUBPRODUCTS ARE NOT GIVEN A QUOTA, QUOTAING A GDS FAILS.

The report on the pilot follows and is given in full as it is an excellent example of what a product officer or executive runs into and how it is solved.

"During the last two weeks, while running the FSO, I've had a lot of experience with the above subject, and thought that the data that I have on it might be useful to you.

"When first going into the org I pushed for actual products along with quotaing of the GDSes.

"This went over very well, however, the day you sent a telex *to quota the products that make up the stat,* things really started moving much better.

"Your telex really opened the door for me as to how to go about getting an org to work on products and get stats up.

"Here is the best example. The week before last on Monday or Tuesday the student points were heading for bad down stats for the week. The D of T was more or less tearing her hair out about how she could meet her quota. She and the Tech Sec were trying to figure out what had changed.

"This was right after I had read your telex referred to above, so what I did was to tell them how they had to work on the products that make up the stat.

"The next step was *to list out what the subproducts were that made up the stat.* I just made a very simple list, not necessarily a complete one, of: (1) course starts, (2) F/Ning students, (3) students that are on target, (4) students that increase their production daily. Then made sure the D of T would understand how these made up the stat.

"The next step after that was to change 1–4 above into 'number of.'

"This brought about what one could call instant sanity and exclamations of realizations of how the area could be handled.

"This was followed up by making the D of T work on each of these products. It took a lot of work and figure out how to do, as far, far from all students were F/Ning, etc. It took actions like finding every bogged student and debugging him on a flat-out basis.

"The end result was that the stat did not crash, but went up some, and this week went up even more.

"Other actions were required in the area, such as the Qual Sec and Chief Off sorting out the TRs Course, the D of T doing TRs, and more, but it worked for sure.

"After this, we made this the pattern for the dept heads to follow: i.e., work on the products and subproducts that make up the stat, list them out, quota them, make the quotas, make your GDS quotas.

"It has also been put in on Dept 18 lines, so that Tours and external Reges are no longer pushed on GI and bodies only. There is a pilot project with Flag Service Consultant WUS since a few days which puts in a whole subproduct system and quotaing and reporting on it, which was very well received.

"However, what I also wanted to tell you, is that *this does not go in automatically,* we're still catching bugs on it.

"These are the bugs that have been run across:

"1. Dir Reg had a bunch of subproducts and products beautifully quotaed, but when asked what his quotas were for 'closes' and 'completed Reg cycles,' he dropped his jaw as he had not thought about that.

"He immediately quotaed these and production increased right away.

"2. The Dir Procurement (Dissem Sec HFA) had not set any quotas for CF/Address as she stated that 'that area would not be possible to quota.' Her MU was that she thought she had to quota every single area of Addresso, rather than the part they were working on at the moment. She had a major win on this.

"She also kept her quotas in her head as she 'hated to have papers lying around.' She since has them all in a book and is very happy.

"3. The Dist Sec could not think of the subproducts that would produce NNCF.

"4. The Dir Income was working on subproducts in such a way that they did not add up to his GDS, or rather, that they did not result in his GDS quota being met, and tried to justify this.

"Several others required close personal contacts to list out what the products would be that made up their stat.

"MUs are still coming up, but it sure works! It's brilliant, Sir.

"My picture of an org that operated on this basis with every staff member should be incredible.

"Now, I have looked at the trouble an executive would run into implementing the order to quota products that make up stats, and I can see lots, unless you know exactly how to do it.

"This is what I see on it:

"You would have to keep the GDS quota there and in mind constantly, as if you don't, things can slack off too easily.

"You would have to bring the terminals concerned to an understanding of the cycle of working on products that make up the stat.

"You would have to get a list of what the products and subproducts are, without making it miles long.

"You would have to make sure that the list is complete, per policy and actually makes up the stat.

"You would then have to make sure that the list is quotaed.

"You would then have to make sure that the quotas are met, and you would have to watch out for anyone using it wrongly so the GDS quota is not met.

"On most of these you would have to make sure that there are proper 'figure out how to do's,' on how to go about getting the products.

"The above actually, now that I look at it, fits in exactly with your PLs on Name, Want and Get the Products.

"I think also what is of importance is that you really break down what it takes to get the products: i.e., if the DTS here was told to get 10 fully paids into the org, she would be 'blank,' until you broke it down into — make up the list of them, make so many contacts, get so many ETAs, etc.

"Pressure is still required to get a momentum and keep it going.

"Another example is getting out over 100,000 pieces of promo in one week. It takes incredible detailed planning that covers everything; when what has to be through I/A and on to the assembly line, what checks have to be gotten when, what has to be addressed when and franked, what all hands are needed and when, etc. I had to force through exact planning on this with targets assigned, etc., and then push like mad.

"The use of HCO PL 8 Feb. 72, Exec Series 7, TARGETING OF DIVISIONAL STATISTICS AND QUOTAS, is also very important in all this."

Therefore these conclusions can be considered valid and vital:

EVERY GDS MUST BE BROKEN DOWN INTO SUBPRODUCTS AND THE STAFF MEMBERS MUST KNOW THEM IN ORDER TO ATTAIN A GDS.

And:

EVERY SUBPRODUCT MUST BE QUOTAED FOR A GDS QUOTA TO BE ATTAINED.

EXECUTIVE SERIES 19-1
ORG SERIES 37-1

SUBPRODUCTS
HOW TO COMPILE A SUBPRODUCT LIST

If you take any VFP and trace it backwards step by step, using a BE–DO–HAVE breakdown of what it took to create it and then wrote up the list as preliminaries, you would have a subproduct list.

Let us take a cup of coffee as the VFP. The minimum subproducts list would divide into what you had to be, what you had to do and what you had to have to wind up with a cup of coffee.

Be: Somebody who wanted a cup of coffee, somebody hatted to make coffee.

Do: Boil water, add coffee, put coffee in a cup, put it someplace where it could be drunk, let it cool until it was drinkable.

Have: Money to buy the necessary, or the ability to make money so you can buy the necessaries or the skill to create the necessaries: water, a pot to boil water in, fuel to make a fire, a fire to put a pot on, time to boil the water, coffee, the skill to make a cup of coffee, a cup to pour it in when made, a place to put it or drink it.

Now when you put this into a sequence of actions you will see that it looks like a doingness list. So you would have to add the havingness list and there would be no point in it unless you brought about the beingness list.

Now, from the above you could work out the subproduct list of a cup of coffee. Now, if at some future date you found out there was something wrong with the coffee valuable final product all you would have to do is assess this list and find out how come no VFP. The subproduct omits and wrong targets would leap at you and, if handled, could result in the VFP of a cup of coffee quite promptly.

And if you yourself were not involved in making the cup of coffee you would be able to debug how come no cups of coffee.

And if other departments or people had to be convinced there was valid reason for no cup of coffee you would use the list.

So as an exercise why don't you compile the subproduct lists for a cup of coffee.

When you get into anything as vast and complex as an org you can see that subproduct lists are vital to the understanding and accomplishment of VFPs.

And you would not be asking do you have to have one staff member for making each step of making a cup of coffee.

Now, as a second exercise take a valuable final product and break it down yourself, just like we broke down the cup of coffee, and searchlights will play against the sky, bands will strike up and understanding will reign everywhere and so will VFPs.

Not getting pcs audited? Not getting students trained? Not getting mobs of people walking in the front door? Not buying new buildings? Not having a highly trained expert staff? Do some subproduct lists and assess them and you'll know all about it.

USE AS ORDERS

If a valid subproduct list is used as a basis for issuing orders to a staff member, a section, department, division or org, they will be right targeted and valuable final products result.

It will greatly increase org efficiency and show up holes.

When the orders are issued and VFPs do not appear you will know what you are getting and what you are dealing with: Noncompliance? Sabotage? Overload? No recruitment? No hatting? R/Sers? Misguided staff? or what? Well that would be up to you to investigate and you have a guide of the subproduct list and what didn't or couldn't occur and get busy and do something about it.

USE AS QUOTAS

Subproducts can be quotaed and should be but they can only be quotaed in view of what can be done with what one has.

When you quota just one subproduct in a long line-up of other unquotaed subproducts, you can get into a situation where the subproduct or the quotaed subproduct is lacking support and so won't occur. In this case you can see that the subproduct gets the support while being obtained on a cope basis.

You can't just chant a lot of figures at a staff.

It is safer to quota the doable and then gradually add quotas to new doables as your facilities and capacity expand.

You can quota an HGC on pcs gotten into session. But remember you will also have to quota Tech Services phone calls and letters.

To do quotaing you have to know how to "play the piano" and have to be totally knowledgeable of existing scenes at any given moment. It is not an ivory tower job.

You can quota 500 file folders filed but remember you had better quota, for that time only, 500 file folders if there are none.

Quotaing does result in subproducts which result in VFPs and should be done.

But it is a highly educational process. The response can be anything from "They don't make them anymore" to "The auditors have no pens" or "It's busted" but the point is whatever turns up on quotaing, you can handle it.

If you don't quota you probably won't have anything to handle and the result is a nice soft idle life of total poverty for one and all.

Subproduct lists are made for those who are not dedicated to the cult of poverty and destitution.

So quota and very soon you will find out more about playing the org piano than ever before and you may even get some VFPs too which is after all the label of the game. If you misquota too often and don't learn in the process you'll probably get a mutiny.

It's fairly certain that if you quota nothing you won't ever get a cleared area. So quota away and quota intelligently.

DEBUG USE

A major use of subproduct lists is debugging the absence of high quantity, high quality valuable final products or no product at all.

As it is VFPs which keep an org going, not promises or hope you can see that a subproduct list is vital to straighten out an area.

By assessing the subproduct lists against a direct inspection of the area to which it applies one can see the major things that are missing. It is these missing things which are preventing the attainment of the valuable final product of the area, so vital to the org's survival.

UNDERSTANDING

A subproduct list enormously assists an understanding of what an area is supposed to be doing.

It will be found that staffs in a section or department or even division don't really know what it is supposed to be doing.

By simply taking up the subproduct lists with them point by point, they will suddenly envision the VFP and see what it really is.

PRODUCTION

People can be very busy without producing anything. The busyness of people can sometimes be rather misdirected.

By having an exact list of subproducts, a staff gets a very good reality on what productive busyness is. They will coordinate their busyness and drop out nonproductive busyness and real org VFPs will begin to appear.

ORGANIZATION

As an org is compartmented, staff members in one part of an org or even in one part of a department have no view of other areas and don't know what they are supposed to be doing. A subproduct list is highly informative to them. What *is* supposed to be coming out of that other area?

NAVIGATE
FIRST PAGE
SEARCH
FIND
AGAIN
EXIT
CONTENTS
ORG BOARDS
INDEX

Also a staff member is a part of a flow line. If he has no idea what the point earlier on the line is supposed to be doing and what the point later on the line is supposed to be doing, he sometimes can't see the value of what he is supposed to be doing and does not take adequate responsibility for it as he may not conceive how important it is to the VFP.

A case in point of this — you won't believe it — was where a Division 2 could not understand why they got no re-signs until they found out that F/Ning students were a subproduct of the Academy. When they discovered this — and that there were no F/Ning students in the Academy but an awful lot of high TA students — they couldn't do anything about their own plight. (Needless to say the fur flew at the staff meeting.) Thus, using subproduct lists, a part of an org can improve itself and its own VFP by knowing what subproduct another part is supposed to be producing.

INCOMPLETE LISTS

Where you have incomplete subproduct lists — and probably no subproduct lists are perfect — you can get a false sense of security.

An incomplete list does not operate well as a debug list. Thus subproduct lists have to be intelligently used and often recompiled. They also have to be suitable to the activity for which they are compiled.

WRONG LISTS

Where a subproduct list is wrongly worked out the staff in that area can be mistargeted and can be made very busy again with no VFP.

The test of any subproduct list is: Is it resulting in VFPs? If not, somebody has been busy making a staff busy.

The test of a correct subproduct list is does it result in good VFPs when used.

And knowing all this, you can now act and the VFPs will now magically appear.

It's all just magic after all isn't it.

HCO POLICY LETTER OF 9 JANUARY 1980

REMIMEO
ALL STAFF
ALL ORGS,
SO AND SCN

EXECUTIVE SERIES 20

DEPARTMENTAL MINI PROGRAMS: THE KEY TO ACHIEVEMENT

Ref: Target Series PLs, OEC Volume 0

This policy letter is based on LRH ED 293R, which was issued originally as the 78–79 BIRTHDAY GAME FOR ORGS and reissued as the 79–80 BIRTHDAY GAME BY OVERWHELMING DEMAND FROM STAFF THE WORLD OVER.

As the program was highly effective, all of its steps and actions now become firm policy, in order to preserve and continue its use, and this policy letter, which includes the full content of the program, is to be maintained as a standard org CO/ED tool.

To achieve the product of a flourishing, prosperous org, a CO or ED with the help of the LRH Comm and Flag Rep, the Executive Council and Ad Council and staff, must have control of his org.

An ED or CO who takes the initiative in controlling and running his org and does so with know-how is worth his weight in gold. The same is true of a divisional secretary or department head in an org.

In orgs where such initiative was taken and the actions contained in this policy letter were carried out by the executives, the stats rose and the org thrived.

The key to such achievement was and *is* MINI PROGRAMS based on policy for each department of the org.

These programs are done FOR EACH DEPARTMENT by:

1. Personally inspecting the department.

2. Writing up a simple mini program THAT CAN BE DONE, and is WITHIN THE AVAILABLE RESOURCES, IS BASED ON SPECIFIC HCO PLs APPLIED WITH EXPERIENCE AND IN THE KNOWLEDGE OF SUCCESSFUL ACTIONS, LRH EDs AND APPROVED EVALS AND CONTAINING BRIGHT IDEAS DEVELOPED FROM POLICY AND THE EXISTING SCENE ON HOW TO ACTUALLY BRING ABOUT A RESURGENCE OF THAT DEPARTMENT AND GETTING IT TO GET THE WORK DONE THAT HAS TO BE DONE BY THAT DEPARTMENT TO BOOST THE ORG.

3. Issuing the program.
4. Making the execs and staff of the area adhere to that program and not cross-order it and get it done.
5. Reinspecting the area daily to see how it is going.
6. Get the program DONE.
7. When the first program is done, examine the resulting VFP and stats for that department.
8. Reinspect and do a new, simple mini program for the department.
9. Issue the new program.
10. Make the execs and staff of the area get it done.
11. Reinspect the area daily to see how it is going.
12. Get that program DONE.
13. When the second program is done, examine the resulting VFP and stats for that department.
14. Personally inspect the department.

Continue the above cycle.

Give copies to staff in that dept and to the execs so they'll know what you're working on.

Send two copies of each mini program to the FOLO which will keep one and forward the other to Data Files Flag.

Neither the FOLO nor Flag has to okay a mini program.

GUIDELINES

Use the following rules:

A. Organize only toward actual production.

B. Post only in the direction of production.

C. Make execs of the affected area handle any flaps. The CO or ED is not "flap crossroads."

D. Use OEC and Management Volume admin tech and quote it in orders.

E. Don't be reasonable.

F. Don't take the conclusions of a junior.

G. When people can't get it done, find people who can.

H. Don't tolerate out-ethics.

I. Use Esto tech.

J. Realize an org is a purveyor and service depot for standard tech, Dianetics and Scientology.

K. Realize that an org controls and expands its field and keeps it active and happy.

L. Realize that the staff welfare and status depends on the activity and prosperity of the org.

M. Realize that the org is not a commercial company but the center of a religious movement which is changing the society.

DELIVERY

Completed intensives and completed courses are the keynote to an org's prosperity. These stats continue to be reported.

Gear up to really deliver. This requires a TTC, auditor recruitment and a well-staffed Academy and HGC that works and is on the ball.

There is not one single staff member, unit, section, department or division of an org that does not have an individual delivery demand or quota and that does not contribute to the overall delivery of Scientology to the public, directly or indirectly.

Exchange within the org and between the org and every member of the public and the broad public is accomplished only by delivery. All mini programs must reflect this.

GI

There are several distinct sources of GI in an org. Make each one work to independently support the org.

These are:

Department 6

Department 18

Department 5

Qual

Department 7

Department 4 (books, packs, meters, etc.)

Income comes from different sections of the departments within the department.

All this data is in OEC Volumes.

Every one of these points of GI entrance should be producing.

There is also a system of examining invoices to find out what geographical areas the org's people come from and saturating these areas with promo.

FSMs have to be built up and cultivated — and paid promptly.

Refunds have to be held to a minimum by actually delivering and delivering very standard tech.

One has to get all the GI doors open and functioning — a thing to remember in doing departmental inspections. Is there any door there to open? And if it *is* there, is it open?

PRODUCTION VERSUS ORGANIZATION

You can organize with no production and you can try to produce without organizing.

You have to keep a nice balance between these two.

You will find that in the current disorganized family and educational scene that personal concepts of organization and order are not very high and must be developed in individual staff members as well as units, sections, departments, divisions and the whole org. This is as simple as learning to put things down where they belong and where they can be found again when needed and actually creating folders and files. Without this seemingly unimportant order and organization, production of simple cycles takes ages. This must be given attention in mini programs.

MINI PROGRAM

As you will be getting these done regularly in short spaces of time, write *do*able ones that don't take long to finish.

You can defeat an org with 10-page, 200-target programs.

An org can be put into a productive, winning frame of mind with short, *do*able programs.

It takes good sense to do a mini program that lets the department win. It's easier to keep track of when you pin the individual programs on a target board and get the dones marked in so you know what mini program has to be debugged and when you have to do a new one.

FOLOs

The FOLO handles the overall org health of a continent.

The FOLO must get this policy letter in and being done effectively and to ensure the ED *does* have control of his org.

Where he doesn't as shown by lack of stat response, particularly paid comps, GI and intensives sold and delivered and courses sold and completed and Div 6 services being delivered to a happy public and books pouring out into public hands, the FOLO must intervene — not piecemeal but thoroughly and only on a broad failure of an org to prosper and deliver.

NETWORKS

The duties of networks in reporting and executing remain unchanged and their PL authority is undiminished.

FLAG

Evaluations of continents and individual orgs are done at Flag. This policy letter is a factor in all such evaluations. Flag also manages FOLOs and sees that they operate properly.

Flagrant FOLO, continental or org out-ethics or out-tech, high refunds or lack of a prosperous and delivering org are the primary targets of Flag intervention.

Flag actions are not piecemeal but are directed at whole orgs or continents.

CROSS ORDERS AND INTERFERENCE

Where networks, Flag and FOLO orders cross-order each other into an org, or where a program for the org is unreal, the CO or ED of a FOLO or org must telex the Emergency Officer of the Senior Executive Evaluation and Execution Office, which is situated in the Office of LRH, Flag for clarification.

Protection claimed by reason of upstats, if claimed on falsely reported or padded stats can result in Comm Ev or removal. Therefore, any clarification request must also carry "I attest my stats are true."

Clarifications will be done mainly by policy reference.

Request for clarification is not to be actionable by a FOLO, Flag Bureaux or Aides in any way.

NEW TECH

There have been tons of new tech, new rundowns, new shorter checksheets issued in the past year or two. 1978 was a year of tremendous tech breakthroughs, followed by more tech breakthroughs in 1979 and even now further breakthroughs are evolving from these.

You have been getting these *and* their marketing packages straight along and will continue to get them. There is even a new unit exclusively devoted to exporting these to you.

You have had NED for some time now. Rave, rave successes are still pouring in about it. An org that can't sell, train and deliver that, ain't.

Class IV orgs now have new shorter checksheets with all their bright new tech for their Class 0–IV students. So getting Dianetics and Scientology auditors trained is a snap now. You have a world monopoly on the only and finest tech.

So there's nothing holding you back.

The only claims for such that can exist would be in your imagination.

SUMMARY

What you want, isn't it, is a happy, productive, prosperous org that is servicing its area to make it happy and prosperous.

So (as production is the basis of morale), ask this of any mini program you write: Will this give us a happy, productive, prosperous department?

Well, have at it. You've got the steering wheel. Where's the throttle?

(*NOTE:* I realize that management units, orgs and staffs are daily pounded with false economic data. The real facts of life collide with much false data. Such crippling data comes from many sources — school, advertisers, government, bankers, propagandists, even parents who insisted Johnny be a doctor so he could "live well" or set a horrible example themselves. Many have had a hand in messing up people's wits on the subject. It is a factor in inhibiting the individual prosperity of executives, staff members and orgs. Where an area is not prospering, this PL should be star-rated on its people and the false data they have on this subject stripped so that they then can prosper as they should.)

"Standard of Living" can be defined as the relative quality of a person's or group's possessions, quarters, food, equipment, tools and conditions of their area of work and existence. It is the state of the person's living, including working, environment. Where its potential continuance exists it is related to survival. It is a basic natural economic law that personal production of VFPs and one's standard of living are intimately related.

This applies to the individual as well as the team.

Where violations occur, inequities exist.

At a personal level one must produce in excess of his standard of living just to retain and maintain it.

Actually the "excess" means that because of overload, taxes, services, plant, utilities, raw materials, machine and other costs additional to his own work sphere, a person cannot expect to get the full value of his VFPs all to himself. That is not economically feasible. The "excess" varies from post to post and job to job but is never less than 5x minimum. In industry it is considered to be at least 10x to maintain company standards and solvency. The "excess" can be very high indeed in some industries. But in any case any idea that it should be one-for-one is fatal. People who know little of economics or management sometimes propose a worker should get the full value of his VFPs—but all work and all VFPs require support services and to neglect these would quickly bring on poverty. Even when working for oneself alone these "excess" factors exist and seldom drop below 5x as one still requires support services. Corrected gross income divided by staff has to be at least 5x the cost of the standard of living of the individual staff member for that standard to be barely maintained. This does not mean staff pay should be 1/5 of that figure. It means that all the things (pay included) that go into maintaining their welfare and work environment would have to be covered by 1/5 of that figure. A fairly efficient and prosperous org with a hatted, industrious, gung-ho staff can very easily maintain quite acceptable standards at 1/10 that figure. The actual cash value of every piece of work done by a person can actually be calculated. It is intricate and tricky to do and much subject to over- and underestimation but it can be done. It is not vital to do this but one might just be curious about it. If so, do it for yourself. Thus VFPs can be priced against what they bring in as part of the overall scene even when they seem indirect. All the above figures are very rough and subject to variation but this gives you some idea of what is meant by "excess" in that law.

Where a number of people in a group or on a team do not produce VFPs in excess of their standard of living, they depress the standard of living of the group or team.

Where some in a group do not only not produce VFPs but produce overt products, they actively depress the standard of living of everyone in that group or on that team.

Many economists and theorists seek to avoid that law. They do it to gratify politicians or aggrandize some false philosophy whose true purpose is suppression under other colors. But the law remains and its violation breeds an epidemic of economic ills. Amongst such ills are inflation, superbureaucracy, chaos with the marketplace and a decay of the civilization.

When a whole society demands a high standard of living and yet doesn't concentrate on the personal production of VFPs, it is finished.

Products are the basis of a standard of living. They don't appear from midair. They come from work truly done. Not from hope or false data.

It is a druggie's dream that machines, computers, under the dictatorship will do it all. Machines can raise a standard of living by assisting in production. But they can't do man's living for him. Intelligently designed and used they permit, within limits, increases in population. But machines are just tools. They have to be thought up, designed, built, run and serviced and their raw materials and fuel have to be found and delivered and their products promoted, delivered, used and often in their turn serviced. The machine age was actually recognized as failed when world leaders first began to urge population reduction on the planet to "improve the individual standard

ORG BOARDS
INDEX

of living." If machines were going to solve it all, why is the civilization now in such a steep decline? It took producing men *working* in and with a machine age to make the society go. Not idle mobs on welfare expecting a high standard of living while a few guys work their guts out. Pie in the sky is nice but did anyone ever get to eat it? This misinterpretation of the machine age was a heavy violation of the above economic law. But the real harm of the machine age was creating a false belief that one did not have to produce much to survive. This lowered people's estimate of how much they would themselves have to produce to survive, much less have a high standard of living. Factually one normally has to work fast and expertly and in high volume to bring about any acceptable standard of living for himself and his group. This is a point the machine age obscures. But it remains vividly and demonstrably true.

An executive who works hard yet wonders about his own low standard of living should look over his people to find those who are not producing VFPs or who produce even overt products while yet demanding a living. *They* are absorbing the potential raised standard of living of the group.

Where a group has a very low standard of living, it need only review the above law and its potential violations to understand why.

One cannot, in fact must not, increase the standard of living of a group in ways that violate the above law. It will eventually bring calamity on that group.

In a society led astray by crackpot economics, violations of the above law create a vast number of wrong examples. The rich (most of whom work like mad) are seen as idle or even criminals. The best way of life is made to appear to be idleness. One seems to be owed a living without any effort on his own part. The producing worker should be fined by higher taxation. These are not seen to be simply false data spread about to wreck the place but are held as "truths." And in their wake comes a funeral for that group or society.

There is even an economic theory spread about today called "equalitarianism." It declares everyone should get the same pay and have the same standard of living. It does not mention that anyone should do any work. It holds that the better worker should not be better rewarded. It would crash any society.

Then there is the "monetarist" who believes you can manipulate a whole society with money alone. And no thought of any production. His answer to production? (You won't believe this.) Decrease demand! In other words, reduce everyone's standard of living!

Basic economics eventually catches up with all these weird false pretenses. It may take time but, as in the law of gravity, the apple eventually falls. No matter how many crackpots advance theories to say it can't fall, will go up or vanish. Real basic economic laws are like that. They catch up. So don't wonder about inflation and depression and decayed civilizations. Basic economics caught up with the crackpots.

An executive has to pay attention to the basic law about a standard of living. If he doesn't pay close attention to it, the standard of living of himself and of his group will cave in.

He can be "a good fellow" and seek popularity by attempting to raise the standard above what is earned. He and his group will crash.

He can be foolish and seek to raise his own rewards above what he personally is earning in terms of VFPs. But both he and his group will fail.

He can ignore the real producers of the group and not see that their standard of living is comparable to their individual production. And he and the group will fail.

He can ignore the nonproducers and the overt product makers and, by so ignoring them, tear his own and the group's standard of living to bits.

He can listen to a bunch of PR from a staff member about how valuable that staff member is and surrender to it without ever really counting up the real VFPs that staff member is not producing (or even preventing). (It happens.) Only real VFPs count.

He can work himself half to death without demanding production from others and have his own standard of living crash.

There are swarms of false data flying about today on this subject. It is taught in schools, the very best schools; it is heard on the radio and seen on TV and in the papers. The civilization, as it caves in, is blinded by literally thousands of false ideas about what and how a standard of living occurs. These, where they conflict with the basic law, actively prevent one from prospering as they blind him to the truth of his scene.

In an org or management unit in Scientology, the real VFP is valuable fine people who produce valuable final products who then make up a valuable fine public. Every piece of work and duty in a management unit or an org contributes to that.

The standard of living of an executive, a management unit, an org or a staff member is determined by that one basic economic law: The personal production of VFPs for the group and one's standard of living are intimately related.

HCO POLICY LETTER OF 17 JANUARY 1982

REMIMEO

EXECUTIVE SERIES 22

WHAT IS AN EXECUTIVE?

What is an executive? Is it someone who is important? Who gets more pay? Who has authority? Perhaps. But these are not the real reasons that such posts exist.

Most successful executives can personally do more work than other people: their output, quite usually, is very large. And though this is often necessary, that isn't the reason either.

Let us take up the meaning of the word "executive." It is derived from the word "executor" which means "a person who gets something done or produced." The word comes from the Latin *ex*—completely + *sequi*—to follow, and means "to follow through to the end." In other words, to get something DONE!

In any business or production organization, its prosperity depends upon GETTING THINGS DONE!

The executive is there to ensure that the people produce what they are supposed to produce and in viable quantity and with no overt products.

And that is why an executive is there and that is what he is supposed to do.

In these druggie days of supersocialism, people can get other ideas of why an executive is there. And, unfortunately, executives themselves can get other ideas of their role.

It is an unfortunate fact, whether in a capitalism or a communism, that when an individual human being does not produce, he not only, in the short run or long run, cuts his own throat but he also drags the whole team down. A team or organization that does not produce not only loses its morale and pride, it also is committing eventual suicide.

The graveyards of history are full of "leisure classes" that did not produce: The peasants get real tired of seeing the aristocrats loaf and eventually cut off their heads. Modern times are crammed with beautiful experiments of "workers' paradises" where everyone is starving to death.

One sees the TV commercials and reads the paperbacks and they tell him that his goal is expensively bought leisure and that the ideal is to lie beneath the palm trees and do no work. Whole ideologies get built around this beautiful dream of a world in which no single person ever lifts a finger and sighs away his days in loafing bliss.

Unfortunately, this does not align with the facts. The unhappiest little kids in the world are those who have nothing to do: They whine and mope and quarrel and are quite a burden to their mamas. People on relief or living on social security are the most miserable lot, morale-wise, one ever collided with: They will tell you they would rather have a job. The death rate of men who have retired is startling: Cast aside and feeling purposeless, no longer producing anything, they, as insurance companies will tell you, mostly pine away and die. In short, people who don't produce are very unhappy people.

Union agitators, once upon a time, promised all the workers that in a few decades they would be in clover. Less work and more pay was the slogan. And where today is this dream? Failing to produce, union members are out there in their millions, unemployed! And this lack of production is making the cost of living so high that even if they did work, they would have trouble finding enough dollar bills to buy a hamburger.

A certain amount of lying in the sun is a good thing. A laborer should not be worked to death.

But all things are best in moderation. The "leisure class" goes to extremes of purposeless loafing, the working man produces far less than he's paid for and in either case down comes the organization or the country.

A worker-oriented executive is trying to be liked by not requiring work from his organization: What is he actually accomplishing? He is lowering their living standards; he is pushing them into poverty; if he keeps on failing to persuade them to produce, he will kill them off. It categorizes as a suppressive act. "Go on, Joe, take the day off." "Oh, you poor fellow, you shouldn't work so hard." "Who cares about the stats, let's only work from eleven A.M. to noon." "Are you all comfortable as you doze? Oh, that's good, snore on." Such a person is surely not an executive: He's an impostor with a pistol leveled at the staffs' head. For surely, surely it is HE who has them drawing such low pay and it is HE who will at last, through their tolerated indolence, get them fired. It is HE who will lose the org. That's a pretty high price to pay for "being a good fellow."

Holding a post on which he is entrusted to get things DONE, he is a traitor to his organization and to his staff.

Of course, there are penalties connected to getting people to produce. They are often green and unhatted and need somebody to show them where to put what when. They are often bewildered and don't understand why these papers have to go in the right folders. And when one tries to get them to do some work, they sometimes snarl back or walk off and won't play pool with one anymore.

But if one thinks that by taking it easy on staff he will make points, an executive is VERY mistaken. Usually such an executive is actually despised. Down deep the staff knows what he SHOULD be doing with them and if he, having the title, doesn't do it, they see him as a fake.

It is interesting that staffs respect competent executives who get the job done. They respect the one that makes them work and they trust him.

ORG BOARDS
INDEX

It is a maxim that crews, staffs and employees respect only those in power who do their jobs and get them to do theirs. Oh, yes, they will elect people who tell them they don't have to work. But it's interesting that the first ones they blame when things go wrong are these worker-oriented softies: In the chaos of their wake, the next one people will support is a tough, strong one who knows his business.

The only executives that staffs and crews really respect are those who get them to produce and get the job done.

Look at Carter, the past unlamented president. Although he talked a lot about leadership, although he was the darling of the working man and all that, in office he was so wishy-washy, soft and incompetent — everybody's pal — that they eventually threw him out with a landslide victory for his opponent, a very tough talking man who was actually antisocialist.

However one tries to coat the pill, there is no substitute, in an executive, for the ability to get the crew to produce.

The fire-breathing product officer will be followed and supported when the wishy-washy old pal guy will be stepped all over in the rush to follow a real leader.

Across the world, looking at organizations, one can spot every company and org which has executives who do not get their crews to produce. Such areas loom up like danger flags of trouble. Although their executives might think they are being good fellows, loafingly cheered by all, the fact is that their crews, behind their backs, despise them, the public regards them with contempt and the upper management echelons look at those loafing stats and put the names of those executives in a little black book for soonest firing.

It is not hard to detect a happy, cheerful org: Its stats are up. And it is not hard to detect executives who are NOT making their crews produce: There's lots of conflict and trouble in the place and their stats are down.

Management looks everywhere for executives who can get their crews to really produce. And oddly enough, so do the crews. If you don't believe it, try it.

EXECUTIVE SUCCESS

The whole story of marketing is told in just a few words:

ONE FINDS OR STRENGTHENS OR CREATES A DEMAND.

The whole story of economics is told in a few words:

ONE SUPPLIES OR DOES NOT SUPPLY A DEMAND AND GETS ADEQUATELY PAID OR DOES NOT GET PAID FOR IT.

The speed with which one can collect information, debug, write immediate bright, applicable, doable programs or evaluations on each area that will handle marketing, economics, delivery and collection and, above all, the speed with which one can get out letters, despatches and telexes based on the programs and get real dones on them back determines the volume of income in any given time period.

And that's the full essence of executive success.

THE TOOLS OF MANAGEMENT

Refs:

HCO PL	11 Apr. 70 I	THIRD DYNAMIC TECH
HCO PL	28 July 72	Exec Series 16 Org Series 32 Esto Series 26 ESTABLISHING, HOLDING THE FORM OF THE ORG
HCO PL	1 July 82	AKH Series 41 MANAGEMENT COORDINATION

There is a simplicity to managing effectively. It begins with the basics of management.

Although it may appear so to some, successful management is not a highly complicated, esoteric activity. But, just as an auditor or a C/S must know and be able to use the exact tools of first dynamic tech in handling cases in order to achieve exact and standard results on a one-for-one basis, so must an executive or manager know and be able to use the exact tools of third dynamic tech in handling groups to achieve successful and exact results in every instance.

Within the wealth of data on third dynamic tech contained in HCO Policy Letters, the OEC Volumes and recorded LRH lectures and books on the subject, there are certain definite, specific *tools* a manager uses. These are the tools of management.

The difference between brilliant management and mediocre or no management, at any level, lies in:

1. Knowing what the *tools* of management are, and

2. Knowing how to use them.

Many people are not aware that, like a carpenter or any other workman, a manager uses specific and exact *tools*. Thus, we see people here and there who are doing the equivalent of using the handle of a chisel to drive nails into wet concrete.

It is a common fault with inexpert workmen to find them using their tools wrongly or not using them at all. They make a breakthrough when they discover what the specific tools are for.

One can see this in people who can't mix sound or can't become mixing engineers. They sit with all these knobs in front of them, reach out and grab this knob or that one, hoping hopefully something will happen to the sound. Yet every component they have in front of them is an exact tool to do an exact thing with sound!

There are a lot of comparisons one could make, but the point is that people in management positions have precise *tools* available to them in Dianetics and Scientology which happen to be far better tools than have ever been available on the planet.

One can have very good people on management posts who still can drown if they don't know and put to use the management tools.

But without these being specified as exact tools, one might not see the simplicity of it.

MANAGEMENT ECHELONS

Operating as it does into an expanding scene, Scientology has grown into the need for and use of various echelons of management.

In orgs, for some time we have had division heads and above them we have the Executive Council, headed by the CO or ED of the org.

Above the level of service orgs we have middle management and still above that we have the Senior Executive Strata of management. And each of these echelons must know the tools of management and how to use them.

The OEC (Org Executive Course) and the FEBC (Flag Executive Briefing Course) have long been established as the essential courses for training executives at service org level and above.

These courses, and the OEC and Management Series Volumes upon which they are based, teach the form of the org and how to use the parts and posts and functions that go to make up the whole. They give us executives who know how to correctly utilize staff and their assigned posts and duties. We call it "knowing how to play the piano" — it's a matter of knowing what key to hit when and which keys to use in combination to produce a desired result. (Ref: HCO PL 28 July 72, ESTABLISHING, HOLDING THE FORM OF THE ORG) In other words, it's a matter of knowing and using one's tools. The OEC and FEBC courses teach this data and much, much more.

While at this writing there are numerous OEC and FEBC grads and more in the making, thousands more will be needed to handle the current rate of expansion.

Meanwhile an executive at any level and whatever his training needs to know and use his management tools NOW if he is to function at all.

A div head must "know how to play the piano" within his division.

The posts of CO or ED, Chief Officer, Supercargo, Org Exec Sec and HCO Exec Sec require executives who are capable of "playing the piano" across the divisions of the entire org and using hats and posts and functions correctly in order to achieve immediate production from the org as a whole.

At middle management one is handling not one function nor only one org but many orgs and their functions, which requires "knowing how to play the piano" at that level.

And at the Senior Executive Strata of management, we get into the vital need for "knowing how to play the piano" across a much wider sphere, using the full scope of management tools and using them with high skill. One might be using the same tools as lower stratas of management but a higher level of expertise is required as one's planning, decisions and actions are influencing far, far broader areas.

What has brought this about is the rapid expansion of Scientology into wider zones of responsibility and therefore increased responsibility with a resultant increase in traffic. This naturally has to be handled by increasing efficiency. What it has done, in effect, is push some up from lower-level management status to upper-level management status, necessarily. Without realizing it, some executives have been climbing a status stairs in terms of influence and zones of control. And they can go only so high without being terribly precise in their use of tools. After that, without this acquired precision, they drown.

The obvious answer to all of this is an executive training program which instant-hats executives on the fundamental tools of management and provides Management Status checksheets through which an executive or manager raises his status by *becoming more and more expert with these and an even wider range of tools*. And such a program has now been developed!

MANAGEMENT STATUS CHECKSHEETS

The new executive training program consists of three status levels.

These levels are to be covered in a series of Management Status checksheets.

The Management Status One checksheet has a prerequisite of Staff Status II. It *instant-hats* an exec on the basic tools of management, such as:

The Admin Scale, target policy, strategic plans, programs, specific lines and org terminals, org boards, despatches and telexes, statistics and graphs, conditions, hats and hatting, files, personnel folders, ethics folders, etc. Each one is a specific tool.

The Management Status Two checksheet (with an OEC prerequisite) consists of a profound review of the basic management tools and study of the upper-level tools of management, which include:

Surveys, PR, pilots, review of past performance, general economics, finance systems, cost accounting, control through networks, admin indicators, morale, legal, goodwill, exchange, missions (Action missions), economical management and managing by dynamics.

The Management Status Three checksheet (with FEBC prerequisite) would be a more profound review of the basic *and* upper-level management tools, in addition to training on the twelve ingredients of expansion upon which the Senior Executive Strata operates.

Even an OEC or FEBC grad would do the Management Status checksheets as, when he comes out of an OEC or FEBC, all in the clouds, the Management Status checksheet is needed to bring him back down to earth and tell him he's dealing with tools which are very finite tools.

What is being communicated to executives by these checksheets is that they have tools, what the tools are exactly, and that they must use them.

EXECUTIVE STATUS LEVELS

There are specific requirements to be met by a manager to attain each of the three Executive Status levels.

Working up through these status levels, a manager not only becomes more proficient in handling an org, any org, but becomes fully certified to operate at middle or senior echelons of management.

The Executive Status levels are:

1. EXECUTIVE STATUS ONE: At this level, the person is simply thrown on post, the basic management tools are put into his hands via a brief, rat-a-tat-tat Management Status One checksheet and he gets on with it.

2. EXECUTIVE STATUS TWO: For one to be certified at this level, one must have completed the OEC, done the Management Status Two checksheet and have an adequate production record.

3. EXECUTIVE STATUS THREE: For one to be certified at this level, he must have completed the FEBC, done the Management Status Three checksheet and have a proven production record.

When the steps for Executive Status certification are complete, the exec must present adequate evidence of such to the Qualifications Division. After verification of the evidence, he is awarded the appropriate Executive Status certificate.

By use of these Executive Status levels, executives at management levels could see what executives they had (or not had). The designation "ES I" (Executive Status I) would tell them at once what they were dealing with, etc. Also, from the viewpoint of the individual, he would know where he had to go to get an upper-level rating.

Once these Management Status checksheets are issued, middle and central management personnel should not draw full pay or be bonus eligible until they have completed the Management Status One checksheet, as they will not be operating effectively until they have done this.

EXECUTIVE STATUSES AND STAFF STATUSES

The Exec Status levels do not replace Staff Status training. All staff and execs are programed and move up the Staff Statuses so as to have a better idea of the org as an org; these levels are also indicative of the training and experience of a staff member and show his promotion eligibility.

An executive should attain Executive Status One by completing the Management Status One checksheet as soon as possible upon assuming post, so he has the management tools available for his immediate application.

Once an exec attains Staff Status VI (Org Exec Course graduate), he can attain Executive Status Two by fulfillment of the requirements listed above. An FEBC graduate achieves Executive Status Three in a similar fashion.

SUMMARY

With the release of the new Management Status checksheets, precise and gradient training levels for all echelons of management will exist comparable to the precise and gradient training levels required for all echelons of technical delivery.

Quite an unbeatable combination!

One winds up with managers fully familiar with their exact tools, having the one-two-three of management tech at their fingertips, and "knowing how to play the piano" effectively across an org, a continent, a planet!

So the answer to current expansion is an action which is geared to bring about even further expansion. And that is the only way to go!

It begins with the basic tools of management.

HCO PL	11 Dec. 69R I Rev. 16.9.88	APPEARANCES IN PUBLIC DIVS

The amount of public demand for service and your future income are both largely dependent upon GOODWILL.

Goodwill is the reputation an organization has with its publics for integrity, good service, prompt bills paying, high quality delivery, friendliness, etc.

Excellent technical delivery is what generates a blaze of goodwill and PR that spreads by word of mouth like wildfire.

Events, open houses, tours, film or slide presentations — all such activities serve to generate public interest and goodwill.

Training and processing are commodities that are far, far more desirable than anything else this world has to offer. And when they are delivered with superlative technical application with the out-of-this-world gains that are possible, you would drum up so much public support that you would soon have an army of ardent supporters outside your door, no matter how much the psychs and press railed about us.

PR

Good technical delivery makes it possible to have good "PR" (public relations). By definition, PR is good works well publicized. When technical is creating miracles on a regular basis, it is simply a matter of making this broadly known. Your public will even do it for you on a "word-of-mouth" basis.

WORD OF MOUTH

Almost all Scientology prospects come from people who have had service who are urging other people to have service or read books on the subject. That is called WORD OF MOUTH. Word of mouth comes from having numerous people in the field who are happy and cheerful and satisfied with their service and who are active in the fields of Dianetics and Scientology. There is where the bulk of your income comes from.

Word of mouth is a superior form of advertising to newspaper, radio and TV ads. People tend to believe their friends. They are skeptical of advertising. "It worked for Joe, it will probably work for me" is what people think. And in Scientology they are correct.

When word of mouth and PR have been in neglect, it will be because the org has not worked on the basis of goodwill and has let its tech go out (and is therefore costing itself a mint). This applies to all organizations and missions all the way up to the FSO and includes other units and networks as well.

The "word," whether good or bad, spreads like wildfire. That's why you'll never see anything empty out quite as fast as an Academy that is run nonstandardly; or conversely, anything fill up as quickly as a tightly scheduled, smartly run, in-tech Academy.

SUMMARY

Other factors also enter in where goodwill, word of mouth and PR are concerned. The public, in dealing with the business world, has grown to expect clean, pleasant quarters and smart, friendly service.

There is nothing as destructive of goodwill as dirty quarters, sloppy, "help yourself" service and an unfriendly staff.

Clean quarters, professional conduct, good service and above all, a friendly staff, all go a long way to promoting goodwill.

It is not only the job of the Public Relations Officer to secure goodwill. It is part of *every* staff member's job to help build goodwill for the organization by doing those things that will cause the public to think well of it, and by refraining from doing those things that would result in bad PR for the organization.

Above all, it is every staff member's primary concern that the organization is delivering the best tech quality possible. This point *in* is *the* source of goodwill.

You must take a hand in creating goodwill. It is *your* org!

BASIC MANAGEMENT TOOLS

Refs:

HCO PL	29 Dec. 82RA II Rev. 21.1.91	AKH Series 45 Exec Series 24 Org Series 45 Esto Series 45 THE TOOLS OF MANAGEMENT
HCO PL	31 July 83 II	AKH Series 49 Exec Series 27 Org Series 47 Esto Series 48 MANAGEMENT TOOLS BREAKTHROUGH

The following is a list of the materials which, out of the many tools of management, comprise the BASIC MANAGEMENT TOOLS.

1. *ADMIN SCALE:* A scale for use which gives a sequence (and relative seniority) of subjects relating to organization. The scale, from the top down, includes: Goals, Purposes, Policy, Plans, Programs, Projects, Orders, Ideal Scenes, Statistics, Valuable Final Products. The scale is worked up and down until it is (each item) in full agreement with the remaining items. In short, for success, all these items in the scale must agree with all other items in the scale on the same subject.

2. *TARGET POLICY:* A series of policy letters which describe each type of target and how they are to be used by staff, executives and management personnel to get something *done.*

3. *STRATEGIC PLANS:* A STRATEGIC PLAN is a statement of the intended plans for accomplishing a broad objective and inherent in its definition is the idea of clever use of resources or maneuvers for outwitting the enemy or overcoming existing obstacles to win the objective. It is the central strategy worked out at the top which, like an umbrella, covers the activities of the echelons below it.

4. *PROGRAMS:* A PROGRAM is a series of steps in sequence to carry out a plan. Programs are made up of all types of targets coordinated and executed on time.

5. *PROJECTS:* A PROJECT is a series of guiding steps written in sequence to carry out one step of a program, which, if followed, will result in a full and successful accomplishment of the program target.

6. *ORDERS:* An ORDER is the direction or command issued by an authorized person to a person or group within the sphere of the authorized person's authority. It is the verbal or written direction from a lower or designated authority to carry out a program step or apply the general policy. Some program steps are so simple that they are themselves an order or an order can simply be a roughly written project. By implication an order goes from a senior to juniors.

   All orders of whatever kind by telex, despatch or mission orders must be coordinated with current written command intention. You can destroy an org by issuing orders to it uncleared and uncoordinated. Coordinate your orders! Clear your orders!

7. *COMPLIANCE REPORTS:* A COMPLIANCE REPORT is a report to the originator of an order that the order has been done and is a completed cycle. It is not a cycle begun, it is not a cycle in progress, it is a cycle completed and reported back to the originator as done.

   When an executive or manager accepts "done" as the single statement and calls it a compliance, noncompliance can occur unseen. Therefore, one must (1) require explicit compliance to every order and (2) receive the evidence of the compliance pinned to the compliance report. Such evidence might be in the form of copies of the actual material required by the order and procured, or photographs of it, ticket stubs, receipts, a signed note stating the time and place some action was carried out, etc. Evidence is data that records a "done" so somebody else can know it is done.

   It is up to LRH Comms, Flag Reps or execs to verify reports of dones or get dones done. True compliances to evaluated programs are vital.

8. *TERMINALS:* A TERMINAL is something that has mass and meaning which originates, receives, relays and changes particles on a flow line. A post or terminal is an assigned area of responsibility and action which is supervised in part by an executive.

   A fixed-terminal post stays in one spot, handles specific duties and receives communications, handles them and sends them on their way.

   A line post has to do with organizational lines, seeing that the lines run smoothly, ironing out any ridges in the lines, keeping particles flowing smoothly from one post to another post. A line post is concerned with the flow of lines, not necessarily with the fixed-terminal posts at the end of the lines.

9. *LINES:* A LINE is a route along which a particle travels between one terminal and the next in an organization; a fixed pattern of terminals who originate and receive or receive and relay orders, information or other particles.

A COMMAND LINE is a line on which authority flows. It is vertical. A command line is used upward for unusual permission or authorizations or information or important actions or compliances. Downward it is used for orders.

A COMMUNICATION LINE is the line on which particles flow; any sequence through which a message of any character may go. It is horizontal.

The most important things in an organization are its lines and terminals. Without these in, in an exact known pattern, the organization cannot function at all. The lines will flow if they are all in and people wear their hats.

10. *ORG BOARDS:* An ORG BOARD (ORGANIZING BOARD) is a board which displays the functions, duties, sequences of action and authorities of an organization. The org board shows the pattern of organizing to obtain a product. It is the pattern of the terminals and their flows. We see these terminals as "posts" or positions. Each of these is a hat. There is a flow along these hats. The result of the whole org board is a product. The product of each hat on the board adds up to the total product.

11. *HATS:* HAT is a term to describe the write-ups, checksheets and packs that outline the purposes, know-how and duties of a post. It exists in folders and packs and is trained in on the person on the post to a point of full application of the data therein. A HAT designates what terminal in the organization is represented and what the terminal handles and what flows the terminal directs. HATTING is the action of training the person on the checksheet and pack of materials for his post.

12. *TELEXES:* A TELEX is a message sent and received by means of telex machines at specific stations hooked up with one another. This is a fast method of communication, similar to a telegram or cable.

    Use telexes as though you were sending telegrams. Positiveness and speed are the primary factors. Cost enters as a third. Security enters as a fourth consideration. All have importance but in that order.

    Telexes must be of such clarity that any other person in the org can read and understand them. You must take responsibility for both ends of a communication line. Write your communication (telex) so that it invites compliance or answer without further query or dev-t. Entheta in telexes on a long-distance comm line is forbidden.

    Don't use telexes when despatches will do. Nonurgent communications on telex lines jam them. Do NOT put logistics (supply) on a telex line. Telex lines should only be used for communications concerning operations.

13. *DESPATCHES:* A DESPATCH is a written message, particularly an official communication. When writing a despatch, address it to the POST — not the person. Date your despatch. Route to the hat only, give its department, section and org. Put any vias at the top of the despatch. Indicate with an arrow the first destination. Sign it with your name but also the hat you're wearing when you write it.

As with telexes, despatches must be written so clearly that any other person in the org can read and understand them, with the originator taking responsibility for both ends of the communication line. And, as with telexes, entheta in despatches on a long-distance comm line is forbidden.

14. *STATISTICS:* A STATISTIC is a number or amount *compared* to an earlier number or amount of the same thing. STATISTICS refer to the quantity of work done or the value of it in money. Statistics are the only sound measure of any production or any job or any activity. These tell of production. They measure what is done. Thus, one can manage by statistics. When one is managing by statistics they must be studied and judged alongside the other related statistics.

15. *GRAPHS:* A GRAPH is a line or diagram showing how one quantity depends on, compares with or changes another. It is any pictorial device used to display numerical relationships.

16. *CONDITIONS:* A CONDITION is an operating state. Organizationally, it's an operating state and oddly enough, in the MEST universe, there are several formulas connected with these operating states. The table of conditions, from the bottom up, includes: Confusion, Treason, Enemy, Doubt, Liability, Non-Existence, Danger, Emergency, Normal, Affluence and Power or Power Change. There is a law that holds true in this universe whereby if one does not correctly designate the condition he is in and apply its formula to his activities or if he assigns and applies the wrong condition, then the following happens: He will inevitably drop one condition below the condition he is *actually* in. One has to *do* the steps of a condition formula in order to improve one's condition.

17. *PERSONNEL FOLDERS:* A PERSONNEL FOLDER is kept in HCO for each person employed by the org. The folder is to contain all pertinent personnel data about the person: name, age, nationality, date employment started, address (if other than the org), next of kin, social security number, test scores, previous education, skills, previous employment, case level, training level, name of post, former posts held and dates held, production record on post(s), date employment ceased, copies of all tests, and any other pertinent data.

    Copies of contracts, agreements or legal papers connected with the person are filed in the personnel folder. The originals of such papers are kept in the val doc files.

    A personnel folder is used for purposes of promotion and any needful reorganization and so should contain anything that throws light on the efficiency, inefficiency or character of personnel.

    Personnel folders are filed by division and department in HCO, with the personnel in separate folders filed alphabetically in their department. There should be two sections in the personnel files: (1) present employees and (2) past employees.

18. *ETHICS FOLDERS:* An ETHICS FOLDER is kept in HCO for each individual staff member. It is a folder which should include his complete ethics record, ethics chits, Knowledge Reports, commendations and copies, as well, of any

justice actions taken on the person, such as Courts of Ethics or Comm Evs, with their results.

Filing is the real trick of Ethics work. The files do 90 percent of the work. Ethics reports patiently filed in folders, one for each staff member, eventually makes one file fat. When one file gets fat, call up a Court of Ethics on the person and his area gets smooth.

19. *FILES:* A FILE by definition is an orderly and complete deposit of data which is available for immediate use. As FILES are the vital operational line it is of the GREATEST IMPORTANCE that ALL FILING IS ACCURATE. A misfiled particle can be lost forever. A missing item can throw out a whole evaluation or a sale. It is of vital interest both in ease of work and financially that all files are straight.

20. *DATA SERIES:* The tool to discover causes. The administrative technology described in these policy letters is applied to find what is logical by ferreting out what is illogical, using this to reveal the greatest outness which, when remedied, will resolve the scene.

There is considerably more data on each of these tools contained in the policy letters in the OEC Volumes and Management Series Volumes, *none* of it complicated or difficult to grasp.

The purpose of this policy letter is simply to advise the exec that these *are* his tools — his most fundamental and basic management tools. And that they are for USE and it is VITAL that he USE them.

Why? Because use of these simple, basic tools means the difference between a failing org and a flourishing one.

And we want organizations to flourish!

MANAGEMENT TOOLS BREAKTHROUGH

Refs:

HCO PL	29 Dec. 82R II	AKH Series 45
	Rev. 30.7.83	Exec Series 24
		Org Series 45
		Esto Series 45
		THE TOOLS OF MANAGEMENT
HCO PL	31 July 83 I	AKH Series 48
		Exec Series 26
		Org Series 46
		Esto Series 47
		BASIC MANAGEMENT TOOLS

THE FIRST THING AN EXECUTIVE OR MANAGER AT ANY LEVEL NEEDS TO KNOW IS THAT HE HAS *TOOLS* WITH WHICH TO MANAGE.

This applies to top levels of management, to middle management echelons and in every org from the CO or ED down through the Exec Council and every head of a division or department.

BREAKTHROUGH

This datum is the result of a recent, eye-opening breakthrough.

The breakthrough was not a matter of discovering or developing or improving the materials which make up the tools of management. Org boards, the Admin Scale, target policy, planning and programing, statistics, graphs and conditions (to name a few of these tools) have been a part of our technology, well defined, available for use and used for quite some years now.

THE BREAKTHROUGH WAS IN DISCOVERING THAT A GREAT MANY EXECUTIVES DID NOT LOOK UPON THESE AS *TOOLS*.

But unless one does recognize them as tools, unless one actually puts them in the *category of tools,* like rakes and shovels and wheelbarrows, he is apt to think of them as opinions or theories or something of the sort. He won't recognize that he does have actual *tools* with which to manage. And, not realizing this, he won't USE them in managing.

Such a scene could be compared to somebody building a house who didn't even know he was trying to build a house and, should this be pointed out to him, he would look at hammers and saws as if they were total strangers. He wouldn't wind up with a house.

Any activity has its tools. And if one is going to engage in an activity, he had better know what its tools are and that they are for use.

BASIC MANAGEMENT TOOLS

We are rich in management tools but the most fundamental of them, required for use at any executive level from the highest to the lowest, are these:

ADMIN SCALE

TARGET POLICY

STRATEGIC PLANS

PROGRAMS

PROJECTS

ORDERS

COMPLIANCE REPORTS

ORG TERMINALS

SPECIFIC LINES

ORG BOARDS

HATS AND HATTING

TELEXES

DESPATCHES

STATISTICS AND GRAPHS

CONDITIONS

PERSONNEL FOLDERS

ETHICS FOLDERS

FILES

DATA SERIES

Each of these fundamental tools is defined and covered briefly in HCO PL 31 July 83 I, BASIC MANAGEMENT TOOLS.

None of these are complicated. They are actually SIMPLE but VITALLY, VITALLY IMPORTANT.

One gets some terminals, gets them some lines, gets the channels of command and echelon worked out, gets in strategic planning and with that one can achieve some coordination.

But it is necessary to be able to conceive of purpose (which, in target policy, becomes objectives). And it is necessary to be able to write targets that will accomplish that objective or that purpose. To get the targets done one needs lines and terminals there. And to have lines and terminals, of course, one has to have an org board.

SIMPLE. But VITALLY IMPORTANT.

In laying out these tools we are laying out the fundamentals of organization as that, most definitely, is what these tools are. And these tools will give one an organization. Without them, you don't have an organization, you have a mob. And if one cannot figure out purpose or objectives or write targets and telexes and get hatting done and hats worn they'll just keep on being a mob. But correct use of just this basic list of management tools can turn a mob into a producing organization!

EXEC STATUS ONE CHECKSHEET

A fast, instant-hat type of checksheet called Exec Status One is being provided to swiftly train execs and managers at all levels on these tools.

This is not a substitute for an OEC or FEBC. But it is vital that an exec starts using these tools right now, instantly and at once yesterday, if he considers himself an executive or is in a position of handling an organization of any type, size or kind. Because if he doesn't use these tools, he's going to lay an egg.

ETHICS

Once the exec has passed this first checksheet, Exec Status One, it's an ethics offense to fail to use these tools properly. One would handle a first or second offense with cramming, but after that it's a Court of Ethics and, in the case of a person having trained on these tools continuing to misapply or not apply these tools, it becomes a matter for a Comm Ev.

SUMMARY

1. First, an executive or manager must know that actual TOOLS EXIST for his use in managing.

2. Second, he needs to know WHAT his tools are.

3. Third, he must realize that these tools are SIMPLE but VITALLY, VITALLY IMPORTANT, that they are for USE and he must *USE THEM*.

QUAL

EXECUTIVE SERIES 28
PERSONNEL SERIES 33

EXECUTIVE POSTING QUALIFICATIONS

Scientology organizations and their staffs in the past have been subjected to considerable financial losses by appointing to executive positions persons of poor ethics and production records. Therefore this firm policy regarding new appointments to and promotions within Scientology organizations and activities is set and is not to be departed from. Omission of one or more of these in the past has factually cost millions of dollars.

It is expressly forbidden hereafter to propose or post any person to any executive post (Departmental Director or above) without the following:

1. Actual production stats of the proposed person relating to the subject of the post he is being proposed for be found, established and verified.

2. That investigation reveals an acceptable ethics record.

3. Before being posted the person must be checked for any PTSness and any found must be handled.

4. The person must be rolled back for any participation in any black PR activity.

5. The person must be sec checked for false considerations or evil purposes.

6. The person must be false data stripped in relation to the activity he has been or is about to be engaged upon in the organization.

7. In keeping with the policy that any person posted in an executive position in a Scientology organization must be able to achieve, maintain and increase a high level of production and income in his area, the stats found and verified must prove extreme productiveness on the part of the proposed person in the area of the post he is being proposed for. This applies to any executive post. (With the technology and administrative know-how available in Scientology, any exec should, through production and exchange of high quality products, be capable of generating on the order of a million dollars a year for his organization.)

The above requirements are quite in addition to requisite executive status and training certificates held by the person and/or required for the post for which he is being considered. (Ref: HCO PL 29 Dec. 82R II, Rev. 30 July 83, THE TOOLS OF MANAGEMENT)

APPLICATION FOR ACTING STATUS

Before a candidate for an executive posting may assume more than Temporary status, a full CSW covering points 1–7 above and prepared by the Personnel Control Officer must be approved on established executive posting approval lines. The Estab Exec International is responsible for issuing directives setting these approval lines, and for updating them as needed.

Approval lines set up are to include approval of all exec postings by an authorized representative of the Office of Senior C/S Int and an authorized representative of the Inspector General Network.

On receipt of written approval, the candidate is granted "Acting _____" status, and a personnel order to this effect can be issued.

Executive posting CSWs may NOT be allowed to staledate at any point on the approval line.

Establishment and maintenance of approval lines is the responsibility of the Senior HAS International.

REQUIREMENTS FOR PERMANENT STATUS

The following additional requirements are established for *permanent* posting at the level of Departmental Director or above:

8. No person may be permanently posted in a Scientology organization without a thorough apprenticeship under competent supervision before any turnover or permanent posting can occur.

9. No full posting in a Scientology organization can occur until the actual stats of the person achieved during that apprenticeship period have been found to be correct and excellent.

10. No person so assigned as an apprentice on a post may draw a bonus until he is fully Post Purpose Cleared, TIPed, his TIP complete, and he is fully hatted.

APPLICATION FOR PERMANENT STATUS

Once the (Acting) exec has successfully fulfilled the requirements listed in points 8, 9 and 10 above, application is made for Permanent posting. This application follows the same routing as for Acting status. The application consists of a new CSW, with verified evidence of requirements 8–10 above having been met.

Upon receipt of written confirmation of the posting from the Inspector General Network, a personnel order may be issued appointing the executive permanently to that post.

NETWORKS

This policy applies fully to the posting of executives in any of the various management networks, including FBOs, D/FBOs for MORE, Flag Reps, LRH Comms and any other networks.

ESTABLISHMENT OFFICER SERIES 50

HATTING AND THE ENVIRONMENT

There is a single difference I have spotted between past environments I have hatted people in and the current environment. The sea, war, expeditionary wilds are all very dangerous places and a person either gets hatted or he kicks the bucket most gruesomely, not because some senior will clobber him, but because the environment will not only wipe him out but torture him in the bargain.

Now, suppose you had a junior who was always sending problems to you. He never handled them or recommended any handling or tried to prevent them. He even invented them. What would you think of a staff member who did that? Charitably, you could say that he is just green or untrained or deaf or blind or that he has lots of Mis-Us. In some cases these may account for this type of behavior. But there is also this other factor of the environment.

I have taken illiterate crews who were the dregs of the docks and hatted them up into a crack crew very quickly. These guys weren't just illiterate, they were even in awe of someone who could read because they couldn't. Yet, they could be hatted and rapidly. The difference between this and training staff in our orgs is that these guys had to be able to operate in an environment which would have no mercy on them if they failed. They were forced by the environment to know their hats and wear them if they wanted to survive.

A senior in an org can bring duress on his juniors to get the job done. However, this duress, or even threat, is only coming from a senior, not from the environment. A staff member might feel that he has nothing to lose if he doesn't get hatted. He won't get tortured or killed. He'll just have some senior a bit mad at him which is really a bit mild.

In other words, we are apparently trying to hat people in a totally safe space with no threat to them whether they get hatted or don't. After all, someone will pick up all the pieces and pay all the bills, or they can blow and go back to their pot.

Factually, the environment we live in could eat us up. There is more threat to a staff member personally in not doing his job right now than the sea or war or anything like that. The threat to us if we don't make it is eternity.

One could ask a staff member that refuses to get hatted how he would like to spend all of the coming eternity blind, in the dark and in pain. He would probably say he wouldn't like that. But if we don't make it, that's what we've got and that's what he is condemning this planet to.

This probably would sound quite mad to some, yet is the most stark truth I have ever uttered.

A staff member who refuses to get hatted and get out real products does not know what we are trying to do. He doesn't realize that he himself, next life, is for it if we don't make it.

If a sailor didn't get hatted, he only died once in his estimation. If staff in our orgs don't get hatted, they're condemning themselves and the planet to death a thousand times over.

So understand that no matter how mild the environment might appear to you, we are actually fighting a full-scale war against ignorance and enslavement. But we *do* have the tech to win.

ORG SERIES 48

PRODUCT ORIENTATION

Refs:

HCO PL	14 Sept. 70 I	Org Series 2 COPE AND ORGANIZE
Tape:	7011C17 SO	FEBC 1, "Welcome to the FEBC"

One of the primary duties of a product officer is to look around and find some production to do.

On an executive post, the formula one operates on is 50 percent production and 50 percent organize. When the organize is superlative and is very well done (while remaining only 50 percent of the time spent by the executive), it eventually gets up to 75 percent production and 25 percent organize. This is approximately the ideal scene.

OVER–ORGANIZE

Organization is a vital activity. However, when the amount of organize time starts outweighing the production time, it is an indicator of other outnesses. The purpose for organizing in the first place is so that *production* can occur. In an area of organize-organize-organize, one will always find crashing Mis-Us, false data, overts and withholds. In other words, these are the things which turn people into fiddle-fiddle organize.

Organize time should not exceed 50 percent of a person's post time. Cramming and drilling fall under the category of organize, and the 50-50 rule applies here as well. The solution to a flubbing staff member is not to put him onto full-time drilling or cramming. The person should do his correction actions for half a day and be put on the job in some capacity the other half of the day so that he stays accustomed to the scene. Otherwise, the person is liable to get stiff and have trouble getting back onto post when he does finish his correction. Study, and even cramming, is actually an award. What about the guys that are doing all the work? Wouldn't they like to have a full day of cramming too?

KEEPING PRODUCTION ROLLING

It is the responsibility of the executive to keep his staff busy producing.

Many people don't like to be executives because they always have to be ransacking around making sure staff are producing, and finding things for them to do. But personnel are actually put at risk when they aren't kept in production. A big company which suddenly dismisses a lot of personnel simply has shiftless executives who have not found things for the personnel to do.

Even if major production in a particular area is temporarily stopped for some reason, other related (or different) products and subproducts can be found for the staff to do which can be done with existing resources.

As an example of this, suppose one had a movie production company whose camera was out for repair. Though they wouldn't actually be able to put anything on film, there would still be cycles which could be done in the meantime. They could be rounding up props, rehearsing actors, and making sure all the other actions which will be needed to complete that film are done.

It is not a slight matter to overlook things like this because somewhere up the track, in the midst of heavy rush production, suddenly one of these overlooked cycles will pop into view and stall the whole line while it is done on an emergency basis.

SUMMARY

The trick of the product officer is to find blank periods and things to put in them. If one gets conditioned to thinking this way, it becomes a very easy job. Otherwise, it's all panic.

Product orientation is very important, as in the long run, it protects the worker and it gets the show on the road. One can't totally produce or totally organize at any given time. It takes an average between production and organize to keep things going. But the whole point is to keep things going, and keep products rolling out.

DATA SERIES 1

THE ANATOMY OF THOUGHT

There are many types of thought. Unless one knows these types he can make serious errors on administrative lines.

In the unpublished work "Excalibur" (most of which has been released in HCOBs, PLs and books) there was an important fundamental truth. This was

SANITY IS THE ABILITY TO RECOGNIZE DIFFERENCES, SIMILARITIES AND IDENTITIES.

This is also intelligence.

Two or more facts or things that are totally unlike are DIFFERENT. They are not the same fact or same object.

Two or more facts or things that have something in common with one another are SIMILAR.

Two or more facts or things that have all their characteristics in common with one another are IDENTICAL.

SEMANTICS

In a subject developed by Korzybski a great deal of stress is given to the niceties of words. In brief a word is NOT the thing. And an object exactly like another object is different because it occupies a different space and thus "can't be the same object."

As Alfred Korzybski studied under psychiatry and amongst the insane (his mentor was William Alanson White at Saint Elizabeth's insane asylum in Washington, DC) one can regard him mainly as the father of confusion.

This work, "general semantics," a corruption of semantics (meaning really "significance" or the "meaning of words"), has just enough truth in it to invite interest and just enough curves to injure one's ability to think or communicate. Korzybski did not know the formula of human communication and university professors teaching semantics mainly ended up assuring students (and proving it) that no one can communicate with anyone because nobody really knows what anybody else means.

As this "modern" (it was known to the Greeks, was a specialty of Sophists and was also used by Socrates) penetration into culture affects all education in the West today, it is no wonder that current communication is badly strained. Schools no longer teach basic logic. Due to earlier miseducation in language and no real education in logic much broken-down "think" can occur in high places.

A system of thinking derived from a study of psychotics is not a good yardstick to employ in solving problems. Yet the "thinking" of heads of states is based on illogical and irrational rules. Populations, fortunately less "well educated," are assaulted by the irrational (kooky) "thinking" of governments. This "thinking" is faulty mainly because it is based on the faulty logic shoved off on schoolchildren. "You must study geometry because that is the way you think" is an idiocy that has been current for the past two or three decades in schools.

I have nothing against Korzybski. But the general impact of "general semantics" has been to give us stupefied schoolboys who, growing up without any training in logic except general semantics are giving us problems. Increasingly we are dealing with people who have never been taught to think and whose native ability to do so has been hampered by a false "education."

ADMINISTRATIVE TROUBLE

At once this gives an administrator trouble. Outside and inside his sphere of influence he is dealing with people who not only can't think but have been taught carefully to reach irrational conclusions.

One can make a great deal of headway and experience a lot of relief by realizing the way things are and not getting exasperated and outraged by the absurdities that he sees being used as "solutions." He is dealing with people who in school were not only not taught to think but were often taught the impossibility of thinking or communicating.

This has a very vast influence on an administrator. Things that are perfectly obvious to him get so muddled when passed for decision to others that an administrator tends to go into apathy or despair.

For instance it is completely logical to him that some activity must either cut its expenses or make more money before it goes broke. So he passes this on as an order demanding that the activity balance up its income–outgo ratio. He gets back a "solution" that they "get a huge sum each week from their reserves" so they will be "solvent." The administrator feels rattled and even betrayed. What reserves? Do they have reserves? So he demands to know, has this activity been salting away reserves he knew nothing about? And he receives a solemn reply—no they don't have any reserves but they consider the administrator should just send them money!

The idiocy involved here is that the "logic" of the persons in that activity is not up to realizing that you cannot take more out of something than is in it.

And the activity mentioned is not alone. Today the "assets" of a company are said by "competent economists" to be its property-goodwill-cash added to its debts! In short, if you have ten pennies and owe £1,000 then your assets are £1,000.0.10!

Yes, you say, but that's crazy! And you're right.

For an example of modern "think" the Ford Foundation is believed to have financially supported the arming of revolutionary groups so they will be dependent upon the capitalistic system and won't overthrow it even though the revolutionary group could not exist without Ford Foundation support!

A war is fought and continued for years to defend the property rights of landlords against peasants although the landlords are mostly dead.

Electronic computers are exported under government license and paid for by the exporter and shipped to an enemy who could not bomb the exporter without them in order to prevent the enemy from bombing the exporter.

Yes, one says. That's treason. Not necessarily. It is the inability to think! It is the result of suppressing the native ability by false systems of "logic."

PROPER DEFINITIONS

People who annoy one with such weird "solutions" do not know certain *differences*.

Thoughts are infinitely divisible into *classes* of thought.

In other words, in thought there are certain wide *differences* which are very different indeed.

A FACT is something that can be proven to exist by visible evidence.

An OPINION is something which may or may not be based on any *facts*.

Yet a sloppy mind sees *no difference* between a FACT and somebody's opinion.

In courts a psychiatrist (who is an AUTHORITY) says "Joe Doakes is crazy." Joe Doakes is promptly put away for ten years, tortured or killed. Yet this statement is just an OPINION uttered by somebody whose sanity is more than suspect and what's more is taken from a field "psychiatry" which has no basis in fact since it cannot cure or even detect insanity.

A vast number of people see no difference at all in FACTS and OPINIONS and gaily accept both or either as having equal validity.

An administrator continually gets opinions on his lines which are masquerading as facts.

If opinion instead of facts are used in solving problems then one comes up with insane solutions.

Here is an example: By *opinion* it is assumed there are 3,000 pounds of potatoes available in a crop. An order is therefore written and payment ($300 at 10¢ a pound) is made for the crop. One sack of potatoes is delivered containing 100 pounds. That sack was the *fact*. Loss is 2,900 pounds of potatoes.

An administrator runs into this continually. He sends somebody to find an electric potato peeler "just like the one we had." He gets back a paring knife because it is the *same*.

The administrator orders a *similar* type of shirt and gets overcoats.

The administrator feels he is dealing with malice, sharp practice, laziness, etc., etc. He can lose all faith in honesty and truthfulness.

The ACTUAL REASON he is getting such breakdowns is:

SANITY IS THE ABILITY TO RECOGNIZE DIFFERENCES, SIMILARITIES AND IDENTITIES.

The people with whom he is dealing *can't think* to such a degree that they give him insane situations. Such people are not crazy. Their thinking is suppressed and distorted by modern "education." "You can't really communicate to anybody because the same word means different things to everyone who uses it." In other words, all identities are different.

A BASIC LAW is usually confused by students with an INCIDENTAL FACT. This is conceiving a similarity when one, the law, is so far senior to the fact that one could throw the fact away and be no poorer.

When a student or an employee cannot USE a subject he studies or cannot seem to understand a situation his disability is that basics are conceived by him to be merely similar to incidental remarks.

The law, "Objects fall when dropped," is just the same to him as the casual example "a cat jumped off a chair and landed on the floor." Out of this he fixedly keeps in mind two "things he read" — objects fall when dropped, a cat jumped off a chair and landed on the floor. He may see these as having identical value whereas they are similar in subject but widely different in VALUE.

You give this person a brief write-up of company policy. "Customers must be satisfied with our service," begins the write-up. Of course that's a *law* because it has been found to be catastrophic to violate it. On down the page is written, "A card is sent to advise the customer about the order." The employee says he understands all this and goes off apparently happy to carry out his duties. A few weeks later Smith and Co. write and say they will do no more business with you. You hastily try to find out WHY. If you're lucky enough to track it down, you find the shipping clerk sent them a card saying, "Your order was received and we don't intend to fill it."

You have the clerk in. You lay down the facts. He looks at you glumly and says he's sorry. He goes back and pulls another blooper. You threaten to fire him. He's now cost the company $54,000. He is contrite.

All he understands is that life is confusing and that for some mysterious reason you are mad at him, probably because you are naturally grouchy.

What he *doesn't* know is what the administrator seldom taps. It isn't that he doesn't know "company policy." It's that he doesn't know the difference between a law and a comment!

A law of course is something with which one thinks. It is a thing to which one aligns other junior facts and actions. A law lets one PREDICT that if ALL OBJECTS FALL when not supported, then of course cats, books and plates can be predicted in behavior if one lets go of them. As the employee hasn't a clue that there is any difference amongst laws, facts, opinions, orders or suggestions he of course cannot think as he doesn't have anything to which he can align other data or with which to predict consequences.

He doesn't even know that company policy is, "Too many goofs equals fired." So when he does get sacked he thinks "somebody got mad at him."

If you think this applies only to the "stupid employee," know that a whole government service can go this way. Two such services only promoted officers to high rank if they sank their own ships or got their men killed! Social acceptability was the only datum used for promotion and it followed that men too socially involved (or too drunk) of course lost battles.

An organization, therefore, can itself be daffy if it has a concept that laws and facts and opinions are all the same thing and so has no operating policies or laws.

Whole bodies of knowledge can go this route. The laws are submerged into incidental facts. The incidental facts are held onto and the laws never pointed up as having the special value of aligning other data or actions.

An administrator can call a conference on a new building, accidentally collect people who can't differentiate amongst laws, facts, opinions or suggestions — treating them of equal value — and find himself not with a new building but a staggering financial loss.

As the world drifts along with its generations less and less taught and more and more suppressed in thinking, it will of course experience more and more catastrophes in economics, politics and culture and so go boom. As all this influences anyone in any organization it is an important point.

PERSONNEL

In despair an administrator enters the field of choosing personnel by experience with them. He embraces a very cruel modern system that fires at once anybody who flubs.

Actually he is trying to defend himself against some hidden menace he has never defined but which haunts him day by day.

The majority of people with whom he deals — and especially governments — cannot conceive of:

1. differences,
2. similarities,
3. identities.

As a result they usually can't tell a FACT from an OPINION (because all differences are probably identities and all identities are different and all similarities are imaginary).

A = A = A

We have a broad dissertation on this in *Dianetics: The Modern Science of Mental Health* as it affects insane behavior. Everything is everything else. Mr. X looks at a horse, knows it's a house, knows it's a schoolteacher. So when he sees a horse he is respectful.

When anyone in an org is sanely trying to get things done he sometimes feels like he is spinning from the replies and responses he gets to orders or requests. That's because observation was faulty or think was faulty at the other end of the comm line.

As he tries to get things done he begins to realize (usually falsely) that he is regarded as odd for getting impatient.

THE WAYS OUT

There are several ways out of this mess.

a. One is to issue orders that demand close observation and execution. Issuance of clear orders provides no faintest opportunity of error, assumption or default.

b. Another is to demand that an order is fully understood before it is executed.

c. A third is to be sure one totally understands any order one receives before one goes off to do it or order it done.

d. One is to deal *only* in ORDERS and leave nothing to interpretation.

e. Another is to pretest personnel on one's lines for ability to observe and conceive differences, similarities and identities.

f. The effective way is to get the personnel processed.

g. A useful way is to educate people with drills until they can think.

h. Another way is to defend one's areas by excluding insofar as possible adjacent areas where crippled think is rampant.

i. A harsh way is to plow under zones whose irrationality is destructive (such as psychiatry).

THOUGHT CONFUSIONS

Wherever you have thought confusions (where FACT = OPINION, where suggestion = orders, where an observation is taken as a direction, etc., etc., etc.) an administrator is at serious risk.

Misunderstoods pile up on these short circuits. Out of misunderstoods come hostilities. Out of these come overwork or destruction.

The need for all discipline can be traced back to the inability to think. Even when appearing clever, criminals are idiots; they have not ever thought the thought through.

One can conclude that anyone on management lines, high or low, is drastically affected by irrational think.

Individuals to whom differences are identities and identities are differences can muddle up an operation to a point where disaster is inevitable.

These are the third dynamic facts with which an organization lives daily.

The fault can be very subtle so as to nearly escape close search or it can be so very broad so that it is obvious and ridiculous. But on all admin lines, the point that fails has not achieved the basic law:

SANITY IS THE ABILITY TO RECOGNIZE DIFFERENCES, SIMILARITIES AND IDENTITIES.

DATA SERIES 2

LOGIC

The subject of logic has been under discussion for at least three thousand years without any clean breakthrough of real use to those who work with data.

LOGIC means the subject of reasoning. Some in ages past have sought to label it a science. But that can be discarded as pretense and pompousness.

If there were such a "science" men would be able to think. And they can't.

The term itself is utterly forbidding. If you were to read a text on logic you would go quite mad trying to figure it out, much less learn how to think.

Yet logic or the ability to reason is vital to an organizer or administrator. If he cannot think clearly he will not be able to reach the conclusions vital to make correct decisions.

Many agencies, governments, societies, groups capitalize upon this lack of logic and have for a very long time. For the bulk of the last 2,000 years the main Western educator — the Church — worked on the theory that man should be kept ignorant. A population that is unable to think or reason can be manipulated easily by falsehoods and wretched causes.

Thus logic has not been a supported subject, rather the opposite.

Even Western schools today seek to convince students they should study geometry as "that is the way they think." And of course it isn't.

The administrator, the manager, the artisan and the clerk each have a considerable use for logic. If they cannot reason they make costly and time-consuming errors and can send the entire organization into chaos and oblivion.

Their stuff in trade are data and situations. Unless they can observe and think their way through, they can reach wrong conclusions and take incorrect actions.

Modern man thinks mathematics can serve him for logic and most of his situations go utterly adrift because of this touching and misplaced confidence. The complexity of human problems and the vast number of factors involved make mathematics utterly inadequate.

Computers are at best only servomechanisms (crutches) to the mind. Yet the chromium-plated civilization today has a childish faith in them. It depends on who

asks the questions and who reads the computer's answers whether they are of any use or not. And even then their answers are often madhouse silly.

Computers can't *think* because the rules of live logic aren't fully known to man and computer builders. One false datum fed into a computer gives one a completely wrong answer.

If people on management and work lines do not know logic the organization can go adrift and require a fabulous amount of genius to hold it together and keep it running.

Whole civilizations vanish because of lack of logic in its rulers, leaders and people.

So this is a very important subject.

UNLOCKING LOGIC

I have found a way now to unlock this subject. This is a breakthrough which is no small win. If by it a formidable and almost impossible subject can be reduced to simplicity then correct answers to situations can be far more frequent and an organization or a civilization far more effective.

The breakthrough is a simple one.

BY ESTABLISHING THE WAYS IN WHICH THINGS BECOME ILLOGICAL ONE CAN THEN ESTABLISH WHAT IS LOGIC.

In other words, if one has a grasp of what makes things illogical or irrational (or crazy, if you please) it is then possible to conceive of what makes things logical.

ILLOGIC

There are 5 primary ways for a relay of information or a situation to become illogical:

1. Omit a fact.
2. Change sequence of events.
3. Drop out time.
4. Add a falsehood.
5. Alter importance.

These are the basic things which cause one to have an incorrect idea of a situation.

Example: "He went to see a communist and left at 3:00 A.M." The omitted facts are that he went with 30 other people and that it was a party. By omitting the fact one alters the importance. This omission makes it look like "he" is closely connected to communism! When he isn't.

Example: "The ship left the dock and was loaded." Plainly made crazy by altering sequence of events.

Example: “The whole country is torn by riots” which would discourage visiting it in 1970 if one didn’t know the report date of 1919.

Example: “He kept skunks for pets” which as an added falsehood makes a man look odd if not crazy.

Example: “It was an order” when in fact it was only a suggestion, which of course shifts the importance.

There are hundreds of ways these 5 mishandlings of data can then give one a completely false picture.

When basing actions or orders on data which contains one of the above, one then makes a mistake.

REASON DEPENDS ON DATA.

WHEN DATA IS FAULTY (as above) THE ANSWER WILL BE WRONG AND LOOKED UPON AS UNREASONABLE.

There are a vast number of combinations of these 5 data. More than one (or all 5) may be present in the same report.

Observation and its communication may contain one of these 5.

If so, then any effort to handle the situation will be ineffective in correcting or handling it.

USE

If any body of data is given the above 5 tests, it is often exposed as an invitation to acting illogically.

To achieve a logical answer one must have logical data.

Any body of data which contains one or more of the above faults can lead one into illogical conclusions.

The basis of an unreasonable or unworkable order is a conclusion which is made illogical by possessing one or more of the above faults.

LOGIC

Therefore logic must have several conditions:

1. All relevant facts must be known.
2. Events must be in actual sequence.
3. Time must be properly noted.
4. The data must be factual, which is to say true or valid.
5. Relative importances amongst the data must be recognized by comparing the facts with what one is seeking to accomplish or solve.

NOT KNOW

One can always know something about anything.

It is a wise man who, confronted with conflicting data, realizes that he knows at least one thing — that he doesn't know.

Grasping that he can then take action to find out.

If he evaluates the data he does find out against the 5 things above, he can clarify the situation. Then he can reach a logical conclusion.

DRILLS

It is necessary to work out your own examples of the 5 violations of logic.

By doing so, you will have gained skill in sorting out the data of a situation.

When you can sort out data and become skilled in it, you will become very difficult to fool and you will have taken the first vital step in grasping a correct estimate of any situation.

DATA SERIES 2-1

FURTHER ILLOGICS

Data Series 2, LOGIC, lists the 5 primary points of illogic. There are 3 more points of illogic that evaluators should know well and use.

These are:

ASSUMED "IDENTITIES" ARE NOT IDENTICAL

ASSUMED "SIMILARITIES" ARE NOT SIMILAR OR SAME CLASS OF THING

ASSUMED "DIFFERENCES" ARE NOT DIFFERENT

Knowledge and study of Data Series 1, THE ANATOMY OF THOUGHT, and Data Series 2, LOGIC, will give one an understanding of what these outpoints, above, mean and how to recognize and use them in evaluation.

DATA SERIES 3

BREAKTHROUGHS

There are two breakthroughs, actually, that have been made here in the age-old philosophic subject of *logic*.

The first is FINDING A DATUM OF COMPARABLE MAGNITUDE TO THE SUBJECT.

A single datum or subject has to have a datum or subject with which to compare it before it can be fully understood.

By studying and isolating the principles that make a situation illogical one can then see what is necessary to be logical. This gives us a subject that could be called "Illogicality Testing" or "Irrationality Location" but which would be better described as DATA ANALYSIS. For it subjects data and therefore SITUATIONS to tests which establish any falsity or truth.

The other breakthrough consists of the discovery that no rules of logic can be valid unless one also includes the *data* being used. The nearest the ancients came to this was testing the premise or basis of an argument.

Trying to study logic without also having the answers to *data* is like describing everything about an engine without mentioning what fuel it runs on; or making a sentence like "He argued about" or "She disliked" without completing it.

Logic concerns obtaining answers. And answers depend on *data*. Unless you can test and establish the truth and value of the data being used, one cannot attain right answers no matter what Aristotle may have said or what IBM may have built.

The road to logic begins with ways and means of determining the value of the data to be employed in it.

Without that step no one can arrive at logic.

Two things that are equal to each other and to which a third is equal are all equal to one another. If A equals B and B equals C then C equals A. Great. This is often disputed as a theorem of logic and has been ever since Aristotle said so. There is even a modern cult of non-Aristotelian logic.

The facts are that the ancient theorem is totally dependent on the DATA used in it. Only if the DATA is correct does the theorem work.

Lacking emphasis on the *data* being used, this theorem can be proven true or false at will. The philosophers point out the fallacy without ever giving emphasis to data evaluation.

DATA ANALYSIS

Unless you can prove or disprove the data you use in any logic system, the system itself will be faulty.

This is true of the IBM computer. It is true of CIA intelligence conclusions. It is true of Plato, Kant, Hume and your own personal computer as well.

DATA ANALYSIS is necessary to ANY logic system and always will be.

Ships run on oil, electric motors on electricity and logic runs on data.

If the data being stuffed into a computer is incorrect, no matter how well a computer is planned or built or proofed up against faults you can get a Bay of Pigs.

In mathematics no formula will give an answer better than the data being used in it.

VALID ANSWERS MAY ONLY BE ATTAINED IN USING VALID DATA.

Thus, if the subject of Data Analysis is neglected or imperfect or unknown or unsuspected as a step, then wild answers to situations and howling catastrophes can occur.

If Data Analysis becomes itself a codified subject, regardless of what formula is going to be used, then right answers can only then be attained.

THE MIND AS A COMPUTER

The mind is a remarkable computer.

It is demonstrable that a mind which has the wrong answers removed from it becomes brighter, IQ soars.

Therefore for our purposes we will consider the mind capable of being logical.

As processing improves the mind's ability to reach right answers, then we can assume for our purposes that if a person can straighten out his data he can be logical and will be logical and can attain right answers to situations.

The fallacy of the mind is that it can operate on wrong data.

Thus if we specialize in the subject of DATA ANALYSIS we can assume that a person can attain right answers.

NAVIGATE

ORG BOARDS
INDEX

As an administrator (and anyone else) has to reach conclusions in order to act and has to act correctly to ensure his own or his group's continued survival, it is vital that he be able to observe and conclude with minimal error.

Thus we will not be stressing HOW to think but how to analyze that with which one thinks — which is DATA.

This gives us the importance and use of Data Analysis.

DATA SERIES 4

DATA AND SITUATION ANALYZING

The two general steps one has to take to "find out what is really going on" are:

1. Analyze the data,

2. Using the data thus analyzed to analyze the situation.

The way to analyze *data* is to compare it to the 5 primary points and see if any of those appear in the data.

The way to analyze the *situation* is to put in its smaller areas each of the data analyzed as above.

Doing this gives you the locations of greatest error or disorganization and also gives you areas of greatest effectiveness.

Example: There is trouble in the Refreshment Unit. There are three people in the unit. Doing a data analysis on the whole area gives us a number of outpoints. Then we assign these to A, B and C who work in the unit and find B had the most outpoints. This indicates that the trouble in the Refreshment Unit is with B. B can be handled in various ways such as his hat, his attendance, etc. Note we analyzed the *data* of the main area and assigned it to the bits in the area, then we had an analyzed situation and we could handle.

Example: We analyze all the data we have about the Bingo Car Plant. We assign the data thus analyzed as out (outpoints) to each function of the Bingo Car Plant. We thus pinpoint what function is the worst off. We then handle that function in various ways, principally by organizing it and grooving in its executives and personnel.

There are several variations.

WE OBTAIN AN ANALYSIS OF THE SITUATION BY ANALYZING ALL THE DATA WE HAVE AND ASSIGNING THE OUTPOINT DATA TO THE AREAS OR PARTS. THE AREA HAVING THE MOST OUTPOINTS IS THE TARGET FOR CORRECTION.

In confronting a broad situation to be handled we have of course the problem of finding out what's wrong before we can correct it. This is done by data analysis followed by situation analysis.

We do this by grading all the data for outpoints (5 primary illogics). We now have a long list of outpoints. This is data analysis.

We sort the outpoints we now have into the principal areas of the scene. The majority will appear in *one* area. This is situation analysis.

We now know what area to handle.

Example: Seventy data exist on the general scene. We find twenty-one of these data are irrational (outpoints). We slot the twenty-one outpoints into the areas they came from or apply to. Sixteen came from area G. We handle area G.

EXPERIENCE

The remarkable part of such an exercise is that the data analysis of the data of a period of one day compares to three months operating *experience*.

Thus data and situation analysis is an instant result where experience takes a lot of time.

The quality of the data analysis depends on one knowing the ideal organization and purpose on which the activity is based. This means one has to know what its activities are *supposed* to be from a rational or logical viewpoint.

A clock is supposed to keep running and indicate time and be of practical and pleasant design. A clock factory is supposed to make clocks. It is supposed to produce enough clocks cheaply enough that are good enough to be in demand and to sell for enough to keep the place solvent. It consumes raw materials, repairs and replaces its tools and equipment. It hires workmen and executives. It has service firms and distributors. That is the sort of thing one means by *ideal* or theoretical structure of the clock company and its organization.

Those are the *rational* points.

From the body of actual current today data on the clock company one spots the outpoints for a DATA ANALYSIS.

One assigns the outpoints to the whole as a SITUATION ANALYSIS.

One uses his admin know-how and expertise to repair the most aberrated subsection.

One gets a functioning clock factory that runs closer to the ideal.

Military, political and PR situations, etc., are handled all in the same way.

We call these two actions:

DATA ANALYSIS,

SITUATION ANALYSIS.

SITUATION — The broad general scene on which a body of current data exists.

DATA — Facts, graphs, statements, decisions, actions, descriptions, which are supposedly true.

OUTPOINT — Any one datum that is offered as true that is in fact found to be illogical when compared to the 5 primary points of illogic.

PLUSPOINT — A datum of truth when found to be true compared to the 5 points.

DATA SERIES 5

INFORMATION COLLECTION

It is a point of mystery how some obtain their information. One can only guess at how they do it and looking at results wonder if it is actually done at all.

Obtaining information is necessary for any analysis of data.

If one obtains and analyzes *some* information he can get a hint of what information he should obtain in what area. By obtaining *more* data on that area, he can have enough to actively handle.

Thus how one obtains information becomes a very important subject.

Nations have whole mobs of reporters sent out by newspapers, radio, TV and magazines to collect information. Politicians go jaunting around collecting information. Whole spy networks are maintained at huge expense to obtain information.

The Japanese in the first third of the twentieth century had two maxims: "Anyone can spy." "Everyone must spy." The Germans picked this up. They had their whole populations at it. The Russian KGB numbers hundreds of thousands. CIA spends billions. MI6 ——— well, you get the idea.

It is not amiss, however, to point out that those two nations that devoted the most effort to espionage (Japan and Germany) were BOTH DEFEATED HORRIBLY.

Thus the QUANTITY of data poured in is not any guarantee of understanding.

Newspapers today are usually devoted to propaganda, not news. Politicians are striving to figure out another nation's evil intentions, not to comprehend it.

The basic treatise on data collection and handling used to found the US intelligence data system ("Strategic Intelligence") would make one laugh — or cry.

All these elaborate (and expensive) systems of collecting information are not only useless, they are deluding. They get people in plenty of trouble.

A copy of *Time* magazine (US) analyzed for outpoints runs so many outpoints per page when analyzed that one wonders how any publication so irrational could continue solvent. And what do you know! It is going broke!

Those countries that spend the most on espionage are in the most trouble. They weren't in trouble and then began to spend money. They began to spy and then got into trouble!

News media and intelligence actions are not themselves bad. But irrational news media and illogical intelligence activity are psychotic.

So information collection can become a vice. It can be overdone.

If one had every org in a network fill out a thousand reports a week he would not obtain much information but he sure would knock them out of comm.

There *is* a moderate flow of information through any network so long as it is within the capability of the comm lines and the personnel.

Thus we get a rule about collecting data in administrative structures.

NORMAL ADMIN FLOWS CONTAIN ENOUGH DATA TO DO A DATA AND SITUATION ANALYSIS.

And

THE LESS DATA YOU HAVE THE MORE PRECISE YOUR ANALYSIS MUST BE.

And

INDICATORS MUST BE WATCHED FOR IN ORDER TO UNDERTAKE A SITUATION ANALYSIS.

And

A SITUATION ANALYSIS ONLY INDICATES THE AREA THAT HAS TO BE CLOSELY INSPECTED AND HANDLED.

Thus, what is an "indicator"?

An *indicator* is a visible manifestation which tells one a situation analysis should be done.

An indicator is the little flag sticking out that shows there is a possible situation underneath that needs attention.

Some indicators about orgs or its sections would be — dirty or not reporting or going insolvent or complaint letters or any nonoptimum datum that departs from the ideal.

This is enough to engage in a data and situation analysis of the scene where the indicator appeared.

The correct sequence, then, is:

1. Have a normal information flow available.
2. Observe.
3. When a bad indicator is seen, become very alert.
4. Do a data analysis.
5. Do a situation analysis.
6. Obtain more data by direct inspection of the area indicated by the situation analysis.
7. Handle.

An incorrect sequence, bound to get one in deep trouble, is:

A. See an indicator.

B. Act to handle.

This even applies to emergencies IF ONE IS FAST ENOUGH TO DO THE WHOLE CORRECT CYCLE IN A SPLIT SECOND.

Oddly enough anyone working in a familiar area CAN do it all in a split second.

People that can do it like lightning are known to have "fast reaction time." People who can't do it fast are often injured or dead.

Example of an emergency cycle: Engineer on duty, normal but experienced perception. Is observing his area. Hears a hiss that shouldn't be. Scans the area and sees nothing out of order but a small white cloud. Combines sight and hearing. Moves forward to get a better look. Sees valve has broken. Shuts off steam line.

Example of an incorrect action. Hears hiss. Pours water on the boiler fires.

ADMIN CYCLE

When you slow this down to an admin cycle it becomes very easy. It follows the same steps.

It is not so dramatic. It could string out over months unless one realized that the steps 1 to 7 should be taken when the first signs show up. It need not. However, it sometimes does.

Sometimes it has to be done over and over, full cycle, to get a full scene purring.

Sometimes the "handle" requires steps which the area is too broken down to get into effect and so becomes "Handle as possible and remember to do the whole cycle again soon."

Sometimes "handle" is a program of months or years duration, its only liability that it will be forgotten or thrown out before done by some "new broom."

DATA COLLECTION

But it all begins with having a normal flow of information available and OBSERVING. Seeing a bad indicator one becomes alert and fully or quickly finishes off the cycle.

BAD INDICATOR

What is a "bad indicator" really?

It is merely an outpoint taken from the 5 primary outpoints.

It is not "bad news" or "entheta" or a rumor. The "bad news" could easily be a falsehood and is an outpoint because it is false bad news!

"Good" news when it is a falsehood is an outpoint!

RELIABLE SOURCE

Intelligence services are always talking "reliable sources." Or about "confirmed observation."

These are not very valuable ways of telling what is true. The master double spy Philby who as a head MI6 adviser was a Russian spy. Yet for 30 years he determined "reliable sources" for the US and England!

If three people tell you the same thing it is not necessarily a fact as they might all have heard the same lie. Three liars don't make one fact — they make three outpoints.

So it would seem to be *very* difficult to establish facts if leading papers and intelligence services can't do it!

Yes, it is tough to know the truth.

But the moment you begin to work with them, it is rather easy to locate outpoints.

You are looking for outpoints. When they are analyzed and the situation is analyzed by them you then find yourself looking at the truth if you follow the cycle (1) to (7).

It's really rather magical.

If you know thoroughly what the 5 primary outpoints are they leap into view from any body of data.

Oscar says he leads a happy married life. His wife is usually seen crying. It's an outpoint — a falsehood.

The Omaha office is reported by Los Angeles to be doing great. It fails to report. The LA datum does not include that it is 6 months old. Three outpoints, one for time, one for falsehood, one for omitted datum.

Once you are fully familiar with the 5 primary outpoints they are very obvious.

"We are having pie for supper" and "We have no flour" at least shows out of sequence!

It is odd but all the "facts" you protest in life and ridicule or growl about are all one or another of the outpoints.

When you spot them for what they are then you can actually estimate things. And the pluspoints come into view.

DATA SERIES 6

DATA SYSTEMS

Two bad systems are in current use on data.

The first is "reliable source." In this system a report is considered true or factual only if the source is well thought of. This is a sort of authority system. Most professionals working with data collection use this. Who said it? If he is considered reliable or an authority the data is considered true or factual. Sources are graded from A to D. A is highest, D lowest. The frailty of this system is at once apparent. Philby, as a high British intelligence official, was a Russian spy for 30 years. Any data he gave the UK or US was "true" because he was a "reliable source." He had every Western agent who was being sent into communist areas "fingered" and shot. The West became convinced you could not enter or overthrow communist held areas and stopped trying! Philby was the top authority! He fooled CIA and MI6 for years!

Psychiatrists are "authorities" on the mind. Yet insanity and criminality soar. They are *the* "reliable sources" on the mind.

Need I say more?

The other system in use is multiple report. If a report is heard from several areas or people it is "true." The Russian KGB has a Department D that forges documents and plants them in several parts of the world. They are then "true."

Propaganda spokesmen located all over the world say the same thing to the press on every major occasion. This becomes "public opinion" in government circles and so is "true" because it is published and comes from so many areas.

Five informants could all have heard the same lie.

Thus we see these two systems of evaluation are both birdbrain.

TWO PROBLEMS

The two problems that information collection agencies have are:

1. Data evaluation and

2. How to locate the areas they should closely investigate.

For (1) data evaluation they use primarily reliable source and multiple report.

EVERY ITEM RECEIVED THAT IS NOT "RELIABLE" OR "MULTIPLE" IS WASTEBASKETED.

They throw out all outpoints and do not report them!

Their agents are thoroughly trained to do this.

As for (2) areas to investigate, they cannot pinpoint where they should investigate or even what to investigate because they do not use their outpoints.

Using outpoints and data and situation analysis they would know exactly where to look at, at what.

ERRORS

The above data errors are practiced by the largest data collection agencies on the planet — the "professionals." These advise their governments! And are the only advisers of their governments. Thus you can see how dangerous they are to their own countries.

Naturally they have agents who have what is called "flair." These, despite all systems, apply logic. They are so few that Eisenhower's intelligence adviser, General Strong, said in his book that they are too scarce so one is better off with a vast organization.

These agencies are jammed with false reports and false estimations.

An event contemporary with this writing where the US invaded Cambodia shows several data and situation errors. Yet the Viet Cong HQ were using computers. Yet their HQ was wiped out. The US president used CIA data which does not include, by law, data on the US. So the info on which the US president was acting was 50 percent missing! He was only told about the enemy evidently. When he ordered the invasion the US blew up!

A rather big outpoint (omitted facts) don't you think?

FAULTS

The reason I am using intelligence examples is because these are the biggest human data collection "professionals" in the world.

The collection and use of data to estimate situations to guide national actions and the data collection by a housewife going shopping are based on the same principles.

Mrs. Glutz, told by a "reliable source," Nellie Jones, that things are cheaper at Finkleberries and told by enough TV admen she should buy KLEANO tends to do just that. Yet Blastonsteins is really cheaper and by shaving up laundry soap and boiling it she can have ten dollars worth of KLEANO for about fifty cents.

Errors in national data collection give us war and high taxes and for Mrs. Glutz gives her a busted budget and stew all week.

So at top and bottom, any operation requires a grasp of data evaluation and situation estimation.

Those who do it well win and those who don't, go up in a cloud of atomic particles or divorce papers!

Logic and illogic are the stuff of survive and succumb.

There are those who wish to survive.

DATA SERIES 7

FAMILIARITY

If one has no familiarity with how a scene (area) ought to be, one cannot easily spot outpoints (illogical data) in it.

This is what also could be called an IDEAL scene or situation. If one doesn't know the *ideal* scene or situation then one is not likely to observe nonideal points in it.

Let us send a farmer to sea. In a mild blow, with yards and booms creaking and water hitting the hull, he is sure the ship is about to sink. He has no familiarity with how it should sound or look so he misses any real outpoints and may consider all pluspoints as outpoints.

Yet on a calm and pretty day he sees a freighter come within 500 feet of the side and go full astern and thinks everything is great.

An experienced officer may attempt madly to avoid collision and all the farmer would think was that the officer was being impolite! The farmer, lacking any familiarity with the sea and having no *ideal* as to what smooth running would be, would rarely see real outpoints unless he drowned. Yet an experienced sailor, familiar with the scene in all its changing faces sees an outpoint in all small illogicals.

On the other hand, the sailor on the farm would completely miss rust in the wheat and an open gate and see no outpoints in a farm that the farmer knew was about to go bust.

The rule is:

A PERSON MUST HAVE AN IDEAL SCENE WITH WHICH TO COMPARE THE EXISTING SCENE.

If a staff hasn't got an idea of how a real org should run, then it misses obvious outpoints.

One sees examples of this when an experienced org man visiting the org tries to point out to a green staff (which has no ideal or familiarity) what is out. The green staff grudgingly fixes up what he says to do but lets go of it the moment he departs. Lacking familiarity and an ideal of a perfect org, the green staff just doesn't see anything wrong or anything right either!

The consequences of this are themselves illogical. One sees an untrained executive shooting all the producers and letting the bad hats alone. His erroneous ideal would be

a quiet org, let us say. So he shoots anyone who is noisy or demanding. He ignores statistics. He ignores the things he should watch merely because he has a faulty ideal and no familiarity of a proper scene.

OBSERVATION ERRORS

When the scene is not familiar one has to look hard to become aware of things. You've noticed tourists doing this. Yet the old resident "sees" far more than they do while walking straight ahead down the road.

It is easy to confuse the novel with the "important fact." "It was a warm day for winter" is a useful fact only when it turns out that actually everything froze up on that day or it indicated some other outpoint.

Most errors in observation are made because one has no ideal for the scene or no familiarity with it.

However there are other error sources.

"Being reasonable" is the chief offender. People dub in a missing piece of a sequence, for instance, instead of seeing that it IS missing. A false datum is imagined to exist because a sequence is wrong or has a missing step.

It is horrifying to behold how easily people buy dub-in. This is because an illogical sequence is uncomfortable. To relieve the discomfort they distort their own observation by not-ising the outpoint and concluding something else.

I recall once seeing a Tammany Hall group (a New York political bunch whose symbol is a tiger) stop before the tiger's cage in a zoo. The cage was empty and they were much disappointed. I was there and said to them, "The tiger is out to lunch." They told those on the outer edge of the group, "The tiger is out to lunch." They all cheered up, accepted the empty cage and went very happily on their way. Not one said "Lunch?" Or "Who are you?" Or laughed at the joke. Even though it was sunset! I pitied the government of New York!

ACCURATE OBSERVATION

There are certain conditions necessary for accurate observation.

First is a means of PERCEPTION whether by remote communication by various comm lines or by direct looking, feeling, experiencing.

Second is an IDEAL of how the scene or area should be.

Third is FAMILIARITY with how such scenes are when things are going well or poorly.

Fourth is understanding PLUSPOINTS or rightnesses when present.

Fifth is knowing OUTPOINTS (all 5 types) when they appear.

Sixth is rapid ability to ANALYZE DATA.

Seventh is the ability to ANALYZE the SITUATION.

Eighth is the willingness to INSPECT more closely the area of outness.

Then one has to have the knowledge and imagination necessary to HANDLE.

One could call the above the CYCLE OF OBSERVATION. If one calls HANDLE number 9 it would be the Cycle of Control.

If one is trained to conceive all variations of outpoints (illogics) and studies up to conceive an ideal and gains familiarity with the scene or type of area, his ability to observe and handle things would be considered almost supernatural.

DATA SERIES 8

SANITY

An observer has to be sane to sanely observe.

This has been so far out in the society that the word "sane" itself has come to mean "conservative" or "cautious." Or something you can agree with. The nineteenth-century psychologist decided he could not define "normal" and there weren't any normal people. The fourteenth-century psychiatrist is the twentieth-century "authority" on sanity. Yet an examination of such shows them to be unable to demonstrate it personally or bring it about, much less define it.

Dictionaries say it is "health, soundness of body or mind; levelheadedness, reasonableness."

Yet sanity is vital to accurate observation.

FIXED IDEAS

The *"idée fixe"* is the bug in sanity.

Whenever an observer himself has fixed ideas he tends to look at them, not at the information.

Prejudiced people are suffering mainly from an *"idée fixe."*

The strange part of it is that the *"idée fixe"* they think they have isn't the one they do have.

An example of this is the social "scientist" with a favorite theory. I have seen tons of these birds pushing a theory as though it was the last theory in the world and valuable as a ten-pound diamond. Such throw away any fact that does not agree with theory. That's how nineteenth-century psychology went off the rails. All fixed ideas and no facts.

The physical sciences in Hegel's time did the same thing. There was no eighth planet in the solar system, even when found in a telescope, because "seven is a perfect number so there can only be seven planets."

History is full of idiocies — and idiots — with fixed ideas. They cannot observe beyond the idea.

A fixed idea is something accepted without personal inspection or agreement. It is the perfect "authority knows best." It is the "reliable source." A typical one was the

intelligence report accepted by the whole US Navy right up to 7 Dec. 1941, the date of destruction of the US fleet by Japanese planes. The pre-Pearl Harbor report, from unimpeachably reliable sources was "the Japanese cannot fly — they have no sense of balance." The report overlooked that the Japanese were the world's greatest acrobats! It became a fixed idea that caused the neglect of all other reports.

A fixed idea is uninspected. It blocks the existence of any contrary observation.

Most reactionaries (people resisting all progress or action) are suffering from fixed ideas which they received from "authorities," which no actual experience alters.

That British red-coated infantry never took cover was another one. It took a score or two of wars and fantastic loss of life to finally break it down. If any single fixed idea destroyed the British Empire, this one is a candidate.

NORMAL SCENE

The reason a fixed idea can get so rooted and so overlooked is that it appears normal or reasonable.

And somebody or a lot of somebodies want to believe it.

Thus a fixed idea can become an *ideal*. It is probably a wrong ideal. Incapable Japanese pilots would be a *wish* for a navy. It would be wonderful! Red-coated infantry were supposed to be brave and unflinching.

In both cases the ideal is irrational.

A rational ideal has this law:

THE PURPOSE OF THE ACTIVITY MUST BE PART OF THE IDEAL ONE HAS FOR THAT ACTIVITY.

A navy that has an ideal that the enemy can't fly is stupidly avoiding its own purpose which is to fight.

British infantry had the purpose of winning wars, not just looking brave.

Thus one can analyze for a sane ideal by simply asking, "What's the purpose of the activity?" If the ideal is one that forwards the purpose, it will pass for sane.

There are *many* factors which add up to an ideal scene. If the majority of these forward the purpose of the activity, it can be said to be a sane ideal.

If an ideal which does not forward the activity in any way is the ideal being stressed then a fixed idea is present and had better be inspected.

This could be said to be a very harsh utilitarian view of things. But it is not. The artistic plays its role in any ideal. Morale has its part in any ideal.

An ideal studio for an artist could be very beautiful or very ugly so long as it served him to produce his art. If it was very beautiful yet hindered his artistic activities it would be a very crazy ideal scene.

A handsome factory that produced would be a high ideal. But its nearness to raw materials, transport and worker housing are the more important factors in an ideal of a factory. And its location in a country where the government made an atmosphere in which production could occur could be an overriding part of an "ideal scene."

You have to look at what the area is *for* before you can say whether it is ideal or not.

And if its area is too limited to produce or too expensive for it to be solvent, then it isn't a sane scene.

URGES TO IMPROVE

Sometimes the urge to improve an activity is such that it injures or destroys the activity.

If one is familiar with the type of activity he must also realize that there is a law involved:

THE FACT THAT SOMETHING IS ACTUALLY OPERATING AND SOLVENT CAN OUTWEIGH THE UNTESTED ADVANTAGES OF CHANGING IT.

In other words, an *ideal* scene might be vastly different but the actual scene IS operating.

So the factor of OBSESSIVE CHANGE enters. Change can destroy with ferocity.

Whole areas of London, jammed with small but customer-filled shops, have been swept away to make room for chromium high-rent modern stores which stand empty of buyers.

Birmingham, where you could get anything made, had all its tiny craft shops swept away and replaced with high-rent huge new buildings all on some progress-crazy psychotic break.

Possibly the new stores and the huge new shops fitted somebody's "ideal" but they did not match an actual operating environment.

It is this difference between an ideal scene and a practical scene which brings down many old businesses and civilizations.

Therefore, to have an ideal, familiarity with what works is desirable.

It is quite possible without any familiarity, to imagine a successful ideal. BUT IT MUST NOT HAVE ANY FIXED IDEAS IN IT.

It is the fixed idea that knocks a practical operating living environment in the head.

Do-gooders are always at this. They see in a row of old shacks, not economic independence and a lazy life but P-O-V-E-R-T-Y. So they get a new housing project built, shoot taxes into the sky, put total control on a lot of people and cave in a society.

The do-gooder is pushing the nineteenth-century fixed idea of the Comte de Saint-Simon — to gear the whole economy down to the poorest man in it. In other words to reward only the downstat. Everyone becomes a slave of course but it sure sounds good.

Newspapermen are probably the world's worst observers. They observe through the fixed ideas of the publisher or the prevailing control group. Their stories are given them before they leave the office. Yet their observations advise the public and the government!

The outpoints to be found in any contemporary newspaper brand most stories as false before one proceeds more than a paragraph.

Yet this is what the world public is expected to run on.

Naturally it distorts the scene toward raving insanity. This conflicts with the native logic of people so the public thinks the world a lot madder than it really is.

In two cities all newspapers were suspended from publication for quite a period. In both, crime dropped to zero! And resumed again when newspapers were again published.

The ideal scene of the citizen in his workaday world is vastly different than the scene depicted in a newspaper.

The difference between the two can make one feel quite weird.

Thus there should not be too wide a difference between the ideal and the represented scene. And not too wide a difference between the ideal and the actual scene.

R (reality) consists of the isness of things. One can improve upon this isness to bring about an ideal and lead the R up to it. This is normal *improvement* and is accepted as sane.

One can also degrade the R by dropping the representation (description) of the scene well below the actual. In the black propaganda work traditionally carried on by many governments this latter trick of corrupting the R is the means used to foment internal revolt and war.

Both actions of upgrade and downgrade are outpoints when reported as *facts*. "We made £1,000 in reserves this week" is as crazily outpoint as "the government went broke this week" when either one is not the truth.

When the report says, "We should plan a higher income," it is leading to a higher ideal and is not an outpoint mainly because it is not representing any fact but a hopeful and ambitious management.

FIVE POINTS

When none of the outpoints are present, yet you *do* have reports and the scene is functioning and fulfilling its purpose one would have what he could call a sane scene.

If all 5 points were absent yet the scene was not functioning well enough to live, it would be such a departure from the ideal that that itself would be outpoint in that importance was altered. What is out here is the whole situation! The situation analysis would be instantly visible.

But in practice this last happens only in theory, not in practice. A collapsing situation is forecast by outpoints in its data.

Organisms and organizations tend to survive.

A decline of survival is attended also by outpoints.

SANITY IS SURVIVAL

Anything not only survives better when sane but it is true that the insane doesn't survive.

Thus survival potential can be measured to a considerable degree by the absence of outpoints.

This does not mean that sane men can't be shot or sane organizations can't be destroyed. It means only that there is far less chance of them being shot or destroyed.

So long as men and organizations are connected to insane men and organizations, wild things can and do happen unexpectedly.

But usually such things can be predicted by outpoints in others.

When sane men and organizations exist in a broad scene that is convulsed with irrationality, it takes very keen observation and a good grip on logic and fast action to stay alive. This is known as "environmental challenge." It *can* be overdone! Too much challenge can overwhelm.

The difference between such happening to a sane man or organization and to the insane would be that the failure did not itself become a fixed idea.

INSANITY

The 5 primary illogics or outpoints as we call them are of course the anatomy of insanity.

In their many variations the insanity of any scene can be sounded and the nucleus of it located.

By locating and then closely inspecting, such a point of insanity can then be handled.

When you know what insanity really is you can then confront it and handle it. One is not driven into a huge generality of "everything is insane."

By detecting and eliminating small insane areas, taking care not to destroy the sane things around it, one can gradually lift any situation up to sanity and survival.

By seeing what is insane in a scene and seeing why it is insane, one has by comparison also found what is sane.

By locating and understanding outpoints one finds the pluspoints for any given situation.

And that is often quite a relief.

L. RON HUBBARD
FOUNDER

HUBBARD COMMUNICATIONS OFFICE
SAINT HILL MANOR, EAST GRINSTEAD, SUSSEX

HCO POLICY LETTER OF 23 MAY 1970

REMIMEO

DATA SERIES 9
ERRORS

Many who begin to use "illogics," who have not drilled on them so they can rattle them off, choose errors instead of outpoints.

An error may show something else. It is nothing in itself.

An error obscures or alters a datum.

Example: Asking someone to spot the outpoints in a Russian passenger vacation cruise liner in a foreign port, the answers were, "The hammer and sickle are upside down." "The courtesy flag is not flying right side up." These aren't outpoints. The hammer and sickle weren't backwards so *saying* it was was an outpoint. The actual outpoint was *passenger vacation cruise* liner. There is no Russian idle class. It was too big to be giving cruises to winning tractor drivers. Russian and vacation cruise liner just don't go together. Either the reports of Russian refusal to let Russians travel is false or it wasn't a vacation cruise liner but it was. Hence it's an outpoint. An omitted datum. Two contrary data means one is false. Investigation disclosed it was Russian all right and a vacation cruise liner all right. BUT IT WAS CHARTERED TO AN ITALIAN COMPANY THAT SOLD CRUISES TO ITALIANS!

But this leads to a new outpoint. How come the workers' paradise is building huge ships for capitalist pleasures?

If anyone like a Martian was tracing down what's out on this planet, this one outpoint would lead to others.

A situation analysis would indicate an investigation of Russia where outpoints abound and the Martian would know a lot of what's wrong on the planet.

In doing so he would find a lot of capitalistic outpoints which would lead him to investigate the so-called West and he would have the basic "cold war" of communism versus capitalism.

This would lead him into new data the two have in common (economics) and a data analysis of economics would discover the screwiest bunch on the planet, the international banker playing off both sides.

He would have analyzed the planet.

Given that he knew or could translate languages, it might take him a week, starting with a Russian luxury cruise liner, to run down the planetary bad spot.

Now if he *reversed* his investigation and used PLUSPOINTS he would arrive with a situation analysis of what group would be strong enough to handle the down spot and by investigation possibly pinpoint what could tip over the bad spot.

If he just used "errors" he would get noplace.

The ideal he would have to be working from would be a planet at peace where individuals could go about their affairs and be happy without threats of immediate arrest or destruction. It would be a very simple ideal as it would be based only on how planetary populations and cultures survive and that is already laid down in an earlier rule in this series.

Ask somebody to look at a table used for meals at the end of a meal and indicate any outpoints. Usually he'll point out a dirty plate or crumbs or an ashtray not emptied. They are not outpoints. When people finish eating one expects dirty plates, crumbs and full ashtrays. If none of these things were present there might be several outpoints to note. The *end* of a meal with table and plates all clean would be a reversed sequence. *That* would be an outpoint. Evidently the *dinner* has been omitted and that would be quite an outpoint! Obviously no meal has been served so there's a falsehood. So here are three outpoints!

It is best to get what outpoints are down pat. One does this first by thinking up examples and then by observing some body of data and then by looking at various scenes.

It will be found that outpoints are really few unless the activity is very irrational.

Simple errors on the other hand can be found in legions in any scene.

Child's games often include "What's wrong with this picture?" Usually they are just errors like a road sign upside down. But if you had a *brown* rabbit in *winter* holding down a *man* with its front paws and a caption, "Japanese parasols attack _____," you'd have some real outpoints.

A lot of people would try to figure it out and supply *new* outpoints (being reasonable). A learned professor could point out the symbolism. Some would laugh it off. Some would be annoyed by it. And the reason anybody would *do* anything about it is that it is sort of painful to confront the irrational so instead of seeing its isness of illogics an effort is made to make it logical or to throw it away.

The reason misunderstood words or typographical errors were not regarded as a barrier to study was that people converted them or not-ised them. In actual fact a word one does not understand makes a missing datum. Reasonableness or nonconfront enter in and one drops the book.

Errors do not count in pluspoints either.

That a factory has a few errors is no real indicator. A factory has pluspoints to the degree it attains its ideal and fulfills its purpose. That some of its machinery needs repair might not even be an outpoint. If the general machinery of the place is good for enough years to easily work off its replacement value there is a pluspoint.

People applying fixed or wrong ideals to scene are only pointing up errors in their own ideals, not those of the scene!

A reformer who had a strict Dutch mother looks at a primitive Indian settlement and sees children playing in mud and adults going about unclothed. He forces them to live cleanly and cuts off the sun by putting them in clothes — they lose their immunities required to live and die off. He missed the pluspoint that these Indians had survived hundreds of years in this area that would kill a white man in a year!

Thus errors are usually a comparison to one's personal ideals. Outpoints compare to the ideal for that particular scene.

FOUNDER

HUBBARD COMMUNICATIONS OFFICE
SAINT HILL MANOR, EAST GRINSTEAD, SUSSEX

HCO POLICY LETTER OF 23 JUNE 1970

REMIMEO

DATA SERIES 10

THE MISSING SCENE

The biggest "omitted data" would be the whole scene.

A person who does not know how the scene should be can thereafter miss most of the outpoints in it.

An example is the continual rewrite of the International Code (signaling by flags between ships) by some "Convention" composed of clerks who have never gone to sea. Not knowing the scene, the International Code of Signals now contains "How are your kidneys?" but nothing about lifeboats.

College education became rather discredited in Europe until students were required to work in areas of actual practice as part of their studies. Educated far from reality students had "no scene." Thus no data they had was related by them to an actual activity. There was even an era when the "practical man" or "practical engineer" was held in contempt. That was when the present culture started to go down.

On the other hand one of the most long-lived activities around is the wine industry of Portugal. It has almost no theory trained. It is total scene. Every job in it is by apprenticeship for years. It is very constant and very successful.

A good blend would be theory and practical in balance. That gives one data *and* activity. But it could be improved by stressing also the ideal scene.

BODIES OF DATA

Data classifies in similar connections or similar locations.

A body of data is associated by the subject to which it is applicable or by the geographical area to which it belongs.

A body of data can also be grouped as to time, like an historical period.

Illogic occurs when one or more data is misplaced into the wrong body of data for it.

An example would be "Los Angeles smog was growing worse so we fined New York." That is pretty obviously a misplace.

"Cars were no longer in use. Bacterial warfare had taken its toll."

"I am sorry madam but you cannot travel first class on a third class passport."

Humanoid response to such displacements is to be *reasonable*. A new false datum is dreamed up and put into the body of data to explain why that datum is included. (Reasonableness is often inserted as explanation of other outpoints also.)

In the smog one, it could be dreamed up that New York's exports or imports were causing LA smog.

In the car one, it could be imagined that bacteriological warfare had wiped out all the people.

In the train one, it could be inserted that in that country passports were used instead of tickets.

The brain strains to correctly classify data into its own zones and is very rejective or imaginative when it is not.

Intelligence tests accidentally use this one very often.

It remains that an outpoint can occur when a datum belonging to one zone of data, location or time, is inserted into another zone where it doesn't.

Algebra is sometimes hard to learn for some because NUMBERS are invaded by LETTERS. 2x = 10. X is of course 5. But part of a new student's mind says letters are letters and make words.

Primitive rejective responses to foreigners is a mental reaction to a body of people in this case being invaded by a person not of that tribe.

If the scene is wholly unknown, one doesn't know what data belongs to it. Thus a sense of confusion results. Recruits can be sent for ruddy rods for rifles and apprentice painters can be ordered to get cans of sky blue lampblack.

A sense of humor is in part an ability to spot outpoints that should be rejected from a body of data. In fact a sense of humor is based on both rejection and absurd outpoints of all types.

Reasonable people accept displacements with an amazing tranquility by imagining connecting links or assuming they do not know the ideal scene. A reasonable person would accept a pig in a parlor by imagining that there was a good reason for it. And leave the pig in the parlor and revise their *own* ideal scene!

Yet pigs belong to a body of data including barns, pens, farms, animals. And parlors belong to a body of data including teacups, knickknacks, conversation and humans.

Possibly Professor Wundt who "discovered" in 1879 that humans were animals had seen too many pigs in parlors! And based the whole of "psychology" on a confusion of bodies of data!

Murder in a hospital, as done by psychiatry, would be a confusion of bodies of *actions*. Actions belong to their own bodies of data.

One *drives* a car, *rides* a horse. One doesn't ride a car but one can drive a horse. But the *action,* the motions involved with, driving a horse are very different than those used in driving a car. This is a language breakdown called a "homonym." One word means two different things. Japanese is an easy language except for its use of the same word for several different things. Two Japanese talking commonly have to draw Chinese characters (Japanese is written with Chinese characters) to each other to unravel what they mean. They are in a perpetual struggle to pry apart bodies of data.

"1234 Red 789 P 987 Green 432 Apple" as a statement would probably tie up CIA code breakers for weeks as they would *know* it was a code. The same statement would tie up a football coach as he would *know* it was a team play. A mathematician would *know* it fitted into some other activity than his. Hardly anyone would classify it as a totally meaningless series of symbols.

So there is a reverse compulsion — to try to fit any datum found into *some* body of data.

The mind operates toward logic, particularly in classes of things.

The sensible handling of data of course includes spotting a datum, terminal, item, action grouped in with a body of data wrong for it. And in spotting that a datum does not have to belong anywhere at all.

Included in mental abilities is putting similar data into one type of action, items or data. Car parts, traffic rules, communications, are each a *body* of data in which one can fit similar data.

When a person has some idea of the scene involved, he should be able to separate the data in it into similar groups.

An org board is an example of this. Sections are broad classes of action or items into which one can fit the related data. Departments are a broader body of related data, actions, items. Divisions are even broader but still cover related classes of data. The whole org is a very broad class of data, determined in part by the type of product being made.

If a person has trouble relating data to its proper body of data (if he were unaware or "reasonable") he would have an awful lot of trouble finding his way around an org or routing despatches or getting things or wearing his own hat.

Orders are a broad class of data. Orders from proper sources is a narrower body of data. If a person cannot tell the difference he will follow anyone's orders. And that will snarl him up most thoroughly.

I once knew a carpenter so obliging and so unable to classify orders that he built knickknacks, cabinets, shelves, for any staff member who asked and wasted all the time and materials and orders from his boss that were to have built a house! The house materials and money and the carpenter's time and pay were all expended without anything of value to show for it! Not only was he unable to relate orders to their own classes but also couldn't relate materials and plans to a house!

In most miscarriages of projects it will be found that someone on the line cannot relate data or actions to their own classes. Along with this goes other illogics.

So the ability to spot illogics in a known scene can directly relate to efficiency and even to success and survival.

A switch intended for a house put into an airplane electrical system cuts out at 30,000 feet due to the wrong metal to withstand cold and there goes the airplane. A part from one class of parts is included wrongly in another class of parts.

So there is an INCORRECTLY INCLUDED DATUM which is a companion to the OMITTED DATUM as an outpoint.

This most commonly occurs when, in the mind, the scene itself is missing and the first thing needed to classify data (scene) is not there.

An example is camera storage by someone who has no idea of *types* of cameras. Instead of classifying all the needful bits of a certain view camera in one box, one inevitably gets the lens hoods of *all* cameras jumbled into one box marked "lens hoods." To assemble or use the view camera one spends hours trying to find its parts in boxes neatly labeled "camera backs," "lenses," "tripods," etc.

Here, when the scene of what a set up view camera looks like and operates like, is missing, one gets a closer identification of data than exists. Lens hoods are lens hoods. Tripods are tripods. Thus a wrong system of classification occurs out of scene ignorance.

A traveler unable to distinguish one uniform from another "solves" it by classifying all uniforms as "porters." Hands his bag to an arrogant police captain and that's how he spent his vacation. In jail.

Lack of the scene brings about too tight an identification of one thing with another. This can also exclude a vital bit making a disassociation.

A newly called-up army lieutenant passes right on by an enemy spy dressed as one of his own soldiers. An experienced sergeant right behind him claps the spy in jail accurately because "he wasn't wearing 'is 'at the way we do in the Fusiliers!"

Times change data classification. In 1920 anyone with a camera near a seaport was a spy. In 1960 anyone not carrying a camera couldn't be a tourist so was watched!

So the scene for one cultural period is not the scene for another.

Thus a class of data for a given time belongs broadly or narrowly to itself. Including a datum in it or from another time or excluding a datum from it, or forcing a datum to have a class can in any combination produce an illogical situation.

Some knowledge of the scene itself is vital to an accurate and logical assembly or review of data.

The scene therefore, knowledge of, is the basic "omitted data."

The remedy of course is to get more data on what the scene itself really should consist of. When the *scene* is missing one has to study what the *scene* is supposed to consist of, just not more random data about it.

DATA SERIES 11

THE SITUATION

Probably the hardest meaning to get across is the definition of "SITUATION."

One can say variously, "Isolate the actual situation" or "Work out what the situation is" and get the most remarkable results.

To some, a despatch *is* a situation. A small error to others is a situation.

Yet if one wishes to know and use data and logic, one must know exactly what is meant *in this* logic series by SITUATION.

English has several meanings for the one word. In the dictionary it's a "place," a "state or condition of affairs," "a momentous combination of circumstances," "a clash of passions or personalities," or "a job." One gets the feeling that people are fumbling around for a meaning they know must be there.

For our purposes we had better give an *exact* definition of what is meant by SITUATION. If we are going to do a situation analysis by doing an analysis of data, then WHAT is a *situation?*

We can therefore specifically define for *our* purposes in logic the word SITUATION.

A SITUATION IS A MAJOR DEPARTURE FROM THE IDEAL SCENE.

This means a wide and significant or dangerous or potentially damaging CIRCUMSTANCE or STATE OF AFFAIRS which means that the IDEAL SCENE has been departed from and doesn't fully exist in that area.

THE IDEAL SCENE

One has to work out or know what the ideal scene would be for an organization or department or social strata or an activity to know that a wide big flaw existed in it.

To be somewhat overly illustrative about it, let us take a town that has no one living in it.

One would have to figure out what was the ideal scene of a town. Any town. It would be a place where people lived, worked, ate, slept, survived. It could be pretty or historical or well designed or quaint. Each of these would possibly add purpose or color to the town.

BUT this town in question has NO people living in it.

That is a departure from the ideal scene of towns.

Therefore THE SITUATION would be NO PEOPLE LIVE IN THIS "TOWN."

Data analysis would lead us to this by noting outpoints.

6 P.M. — No smoke from house chimneys. (omitted item)

9 P.M. — No lights. (omitted item)

Dawn — No dogs. (omitted terminals)

1910 election poster. (wrong time)

That would be enough. We would then realize that a SITUATION existed because data analysis is also done against the ideal scene.

We would know enough about it to look more closely.

No people! That's *the* SITUATION.

HANDLING

Thus if one were responsible for the area one would now know what to handle.

How he handled it depends upon (a) the need, (b) *availability of resources,* and (c) *capability*.

Obviously if it's supposed to have people in it and if one needs a town there one would have to get a bright idea or a dozen and eventually get people to live there. How fast it could be done depends on the availability of resources — those there or what one has (even as little resource as a voice, paper, pen, comm lines).

One's own capability to get ideas or work or the capabilities of people are a major factor in *handling*.

But so far as *the* SITUATION is concerned, it exists whether it is handled or not.

HOW TO FIND A SITUATION

When you are called upon to find out if there IS a situation (as an inspector or official or soldier or cat or king, whatever) you can follow these steps and arrive with what the situation is every time.

1. Observe.

2. Notice an oddity of any kind or none.

3. Establish what the ideal scene would be for what is observed.

4. Count the outpoints now visible.

5. Following up the outpoints observe more closely.

6. Establish even more simply what the ideal scene would be.

7. *The situation* will be THE MOST MAJOR DEPARTURE FROM THE IDEAL SCENE.

HANDLING

Just as you proceed to the MOST MAJOR SITUATION — go big, when it comes to *handling* it usually occurs that reverse is true — go small!

It is seldom you can handle it all at one bang. (Of course that happens too.)

But just because the SITUATION is big is no real reason the solution must be.

Solutions work on gradient scales. Little by more by more.

When you really see a SITUATION it is often so big and so appalling one can feel incapable.

The *need* to handle comes first.

The resources available come next.

The capability comes third.

Estimate these and, by getting a very bright workable (often very simple) idea, one can make a start.

An activity can get so wide of the ideal scene the people in it are just in a confusion. They do all sorts of odd irrelevant things, often hurt the activity further.

Follow the steps given 1–7 above and you will have grasped the SITUATION. You will then be able to do (a), (b), (c).

That begins to make things come right.

In that way most situations can be both defined and handled.

INTERFERENCE

Lots of people, often with lots of authority, get mired into situations. They do not know they are in anything that could be defined, isolated or stated. They bat madly at unimportant dust motes or each other and just mire in more deeply.

Whole civilizations uniformly go the route just that way.

So do orgs, important activities and individuals.

One can handle exactly as above, if one practices up so he can really do the drill on life.

The only danger is that the situation can be so far from any ideal that others with fixed ideas and madness can defy the most accurate and sensible solutions.

But that's part of the situation, isn't it?

Data analysis is done to make a more direct observation of exactly the right area possible. One can then establish the exact SITUATION.

It's a piece of freedom to be able to do this.

DATA SERIES 12

HOW TO FIND AND ESTABLISH AN IDEAL SCENE

In order to detect, handle or remedy situations one has to be able to understand and work out several things.

These are defining the ideal scene itself, detect without error or guess any departure on it, find out WHY a departure occurred and work out a means of reverting back to the ideal scene.

In order to resolve a situation fully one has to get the *real* reason WHY a departure from the ideal scene occurred.

"What was changed?" or "What changed?" is the same question.

That "change" is the root of departures comes from a series of plant experiments I conducted. (The type of experimentation was undertaken to study cellular life behavior and reaction to see if it was a different *type* of life — it isn't. The experiments themselves were later repeated in various universities and were the subject of much press for them over the world.)

In setting up conditions of growth I observed that plants on various occasions greatly declined suddenly. In each case I was able to trace the last major CHANGE that had occurred and correct it. Changes made in temperature, water volume, humidity, ventilation greatly affected the plants in terms of wilt, decreased growth rate, increase in parasites, etc.

When THE change was isolated and the condition reverted to that occurring during the previous healthy period, a recovery would occur.

At first glance this may seem obvious. Yet in actual practice it was not easy to do.

Gardeners' records would omit vital data or alter importance or drop out time, etc. A gardener might seek to cover up for himself or a fellow worker. He tended to make himself right and would enter falsehoods or reassurance that was a falsehood into the analysis.

A new gardener would seem to affect the plants greatly and one could build a personality influence theory on this — until one found that, being untrained in the procedure used, he would enter even more outpoints than usual.

At such a juncture one would of course train the gardener. BUT that didn't locate WHAT had been changed. And one had to locate that to get the plants to recover. The conditions in use were extreme forcing conditions anyway and lapse of duty was very

apparent. Sixteen-foot hothouse American corn from seeds usually furnishing 5-foot stocks, 43 tomatoes to the truss where 5 is more usual were the demands being met. So any change showed up at once.

The fact of change itself was a vital point as well. One discovery was that life does best in a near optimum constancy — meaning that change just as change is usually harmful to plant life.

The fact of isolating change in the environment as the sole harmful cause was one discovery.

That one had to isolate THE change in order to obtain full recovery was another discovery.

Change itself was not bad but in this experimental series conditions were set as optimum and the beneficial changes had already been made with remarkable results. Thus one was observing change from the optimum.

This would be the same thing as "departures from the ideal scene."

The action was always:

1. Observe the decline.
2. Locate the exact change which had been made.
3. Revert THE change.
4. A return to the near ideal scene would occur if one were maintaining the ideal scene meanwhile.

THE IDEAL SCENE

There are two scenes:

A. The ideal scene,

B. The existing scene.

These of course can be wide apart.

How does one know the ideal scene?

At first thought it would be *very* difficult for a person not an expert to know the ideal scene.

For years certain "authoritarian" people in the field of mental healing fought with lies and great guile to obscure the fact that the ideal scene in mental healing can be known to anyone. Such imprisoned and tortured and murdered human beings with the excuse that they themselves were the only experts. "It takes 12 years to make a psychiatrist." "Expert skill is required to kill a patient."

The existing scene these "experts" made was a slaughterhouse for asylums and the insanity and crime statistics soaring.

They fought like maniacs to obscure the ideal scene and hired and coerced an army of agents, "reporters," "officials" and such to smash anyone who sought to present the ideal scene or ways to attain it. Indeed it was a world gone mad with even the police and governments hoodwinked by these "experts."

Yet any citizen knew the ideal scene had he not been so propaganda frightened by the existing scene.

By constantly pounding in the "naturalness" of an existing scene consisting of madness, crime, torture, seizure and murder, these mad "experts" PUT THE IDEAL SCENE SO FAR FROM REACH THAT IT APPEARED INCREDIBLE. It was so bad a situation that anyone proposing the ideal scene was actively resisted!

Yet the ideal scene is so easy to state that any citizen could have stated it at any time. And often believed it was occurring!

The ideal scene of an asylum would be people recovering in a calm atmosphere, restored to any previous ability, emerging competent and confident.

The ideal scene in the society would be, probably, a safe environment wherein one could happily make his way through life.

Of course, the technology of the mind was the missing data. But the experts in charge of that sector of life paid out hard cash to hoods to prevent any such technology developing — a matter fully documented.

The gap between the ideal scene and the existing scene can be very wide and in any endeavor elements exist that tend to prevent a total closure between the two.

However, approached on a gradient with skill and determination, it can be done.

DEPARTURE

The mental awareness that something is wrong with a scene is the point at which one can begin reverting to the ideal scene.

Without this awareness on the part of a GROUP then an individual can be much impeded in handling a situation.

The mental processes of the person seeking to improve things toward an ideal scene or change them back to an ideal scene must include those who are also parts of the scene.

Seeing something wrong without seeking to correct it degenerates into mere faultfinding and natter. This is about as far as many people go. That something, real or imagined, is wrong with the scene is a not uncommon state of mind. Not knowing what's intended or being done, or the limitations of resource or the magnitude and complexity of opposition, the armchair critic can be dreadfully unreal. He therefore tends to be suppressed, particularly by reactionaries (who try to keep it all as it is regardless).

Unfortunately, the continual battle of life then is between the critic and the reactionary. As this often blows up in pointless destruction, it can be seen there could be something wrong with both of them.

Particularly the inactive, carping critic is at fault on three counts:

A. He isn't doing anything about it.

B. He is not conceiving or broadcasting a real ideal scene.

C. He is not providing any gradient approach to actually attain an ideal scene.

The reactionary of course simply resists any change regardless of who is suffering, providing the reactionary can retain what position and possession he may have.

A revolutionary of course usually:

1. Is doing something about it even if violent.

2. Is conceiving and broadcasting his version of the ideal scene. And

3. Is planning and acting upon some means of bringing about his own ideal scene.

History and "progress" seem to be the revolutionary making his version of progress over the dead bodies of reactionaries.

And although it may be history and "progress" the cycle is usually intensely destructive and ends up without attaining an ideal scene and also destroying any scene existing.

The ancient world is filled with ruins over which one can wander in contemplative and philosophic reverie. These attempts to make and maintain an ideal scene certainly left enough bruised masonry around.

So it is really not enough to natter and it's rather too much to thrust violent change down on the heads of one and all including the objectors.

Violent revolution comes about when the actual ideal scene has not been properly stated and when it excludes significant parts of the group.

It's no good having a revolution if the end product will be a FURTHER departure from the ideal scene.

The pastoral nonsense of Jean Jacques Rousseau was about as wide from an ideal scene as you could get, and it and other efforts, also wide, brought on the French Revolution.

The Russian 1917 Revolution had already been preceded by the democratic Kerensky revolt. But it failed because Russia being Russia was about a century and a half late.

Also the French Revolution was late.

And in both cases those who should have led didn't. Lesser ranks overthrew command.

These and countless other human upheavals mark the fluttering pages of history and history will be written in similar vein again and again to eternity unless some sense and logic gets into the scene.

Revolt is only an expression of too long unmended departures from the ideal scene of society.

Usually the stitches taken to mend the growing social order are too weak and too hastily improvised to prevent the cultural fabric from being torn to rags.

Street battles and angry infantry are the direct opposite of the ideal political scene.

What was needed in such a case was an awareness of departure from the ideal scene, the discovery of WHY a departure occurred and a gradient, real and determined program to return the scene closer to the ideal.

The elements of improved mechanical arts and progress in the humanities may be utilized to effect the recovery. In any event (which is missed by the reactionary and his "good old days") cultures do change and those changes are a part of any new ideal scene. So one does not achieve a reversion to the ideal by turning back the clock. One must be bright enough to include improvements in a *new* ideal scene.

IDEAL SCENE AND PURPOSE

Let us look this over, this concept of the ideal scene, and see that it is not a very complex thing. One doesn't have to be much of an expert to see what an ideal scene would be.

The complex parts of the whole may not make up the whole, but they are not really vital to conceiving an ideal scene for any activity, as small as a family or as big as a planet.

The entire concept of an ideal scene for any activity is really a clean statement of its PURPOSE.

All one has to ask is "What's the purpose of this?" and one will be able to work out what the ideal scene of "this" is.

To give a pedestrian example let us take a shoe shop. Its purpose is obviously to sell or provide people with shoes. The ideal scene is almost as simple as "This activity sells or provides people with shoes."

Now, no matter how complex may be the business or economics of shoe sales, the fact remains that that is almost the ideal scene.

Only one factor is now missing: TIME.

The complete ideal scene of the shoe shop is then, "This activity is intended to provide people with shoes for (time)." It can be always or for its owner's lifetime or for the duration of the owner's stay in the town or the duration of the state fair.

Now we can see departures from the ideal scene of this shoe store.

One has to work out fairly correctly what the purpose of an activity is and how long it is to endure before one can make a statement of the ideal scene.

From this one can work out the complexities which compose the activity in order to establish it in the first place including the speed of the gradient (how much shoe store how fast) and also how to spot *the fact* of departure from the ideal scene.

This process would also work on any portion of the shoe store if the main ideal is not also violated. The children's department, the cashier, the stock clerk also have their subideal scenes. And departures from *their* ideal scenes can be noted.

It doesn't matter what the activity is, large or small, romantic or humdrum, its ideal scene and its subideal scenes are arrived at in the same way.

METHODS OF AWARENESS

Statistics are the only sound measure of any production or any job or any activity.

The moment that one goes into any dependence on opinion he goes into quicksand and will *see too late,* the fatal flaw in restoring anything.

If the fact that anything can be given *production* statistics seems too far out, it is visible that even a guard, who would at first glance seem to be producing nothing but giving only security, is actually producing minutes, hours, weeks, years of continued production TIME.

Probably the most thoughtful exercise is not conceiving the ideal scene but working out what the production statistic of it is. For here, the activity or subactivity must be very correctly staticized to exactly measure the ideal scene of any activity or the statistic will itself bring about a departure!

Just as the purpose from which the ideal scene is taken must be correct, so must the statistic be all the more thoughtfully correct.

As an example, if the ideal scene of the shoe store is given the total statistic of its income then three things can happen:

1. It may cease to provide people with shoes that persuade them to come back for more.

2. It may sell shoes without enough profit to cover overhead and cease to exist.

3. It may conduct itself with more interest in the cashier than the customer and lose its trade.

Probably its statistic is "percentage of citizens in the area profitably shod by this store."

Working out how long it takes to wear out an average pair of shoes, any ex-customer would be retired from the percentage after that timespan had elapsed from buying his last pair.

Given a fairly accurate and realistically updated census figure, that statistic would probably tell the tale of the ideal scene, which has its element of continuance.

The sole fixation on making money can depart from the scene. Abandonment of making any money would certainly cause a departure of the shoe store.

A commando battalion would have just as serious an examination for its ideal scene and statistic as a shoe store! And it would give a very, very effective activity if fully worked out. You'd really have to work out, probably better than the generals who think they have, the real purpose of a commando battalion (which is probably "to disperse enemy preparations by unexpected actions and overinvolve enemy manpower in expensive guarding"). The statistic could be something like "our individual soldiers freed from opponents" and/or "casualties not occurring by reason of interrupted enemy preparations."

In effect the commando battalion would be "producing." The result would be an effective increase in men under arms for their own side.

WHY

Knowing, then, the ideal scene and its statistic, one, by keeping the statistic, can notice without "reasonableness" or somebody's report or some fifth column propaganda, an immediate departure from the ideal scene.

Remember, violent change only becomes seemingly vital when the departure from the ideal scene is noticed *too late*.

Opinion, reports, subject to outpoints as they almost always are, seldom tell one more than somebody else's prejudices or his efforts to cover or failures to observe.

Now that a departure is seen (because the statistic drops) one can quickly go about noticing when and so get at WHY.

When he has the WHY of the departure he can proceed to handle it.

The statistic, guarded against false reports and verified, is a clean statement not as subject to outpoints as other types of statements.

Whole activities have been smashed by not having a statistic of success but taking an opinion of trouble and, reversely, by having a statistic indicating disaster but a broadcast opinion of "great success." Probably the latter is the more frequent.

It is not possible to locate WHY the departure soon enough to remedy unless one takes the most reliable datum available — which is the datum most easily kept clean of outpoints — which is a statistic.

You don't really even know there is a *Why* unless there has been a departure. And the departure may be very hard to spot without a statistic.

I have seen a group producing like mad, doing totally great, but which had no statistic, become the subject of wild outpoints and even contempt within itself.

If an activity lacks an ideal scene and a correct statistic for it, it has no stable datum with which to rebuff opinion and outpoints. To that extent the group goes a bit mad.

Group sanity depends, then, upon an ideal scene, correct subideal scenes and statistics to match.

One of the calmest, safest groups around had a bad reputation with fellow groups because it did not have or make known its ideal scene and did not have or release its statistics.

And it had a hard time of it for quite a while, meantime working exhaustedly but dedicatedly.

Planet, nation, social groups, businesses, all their parts and the individual have their ideal scene and their statistic, their departures and successes and failures. And none fall outside these data.

FOUNDER

HCO POLICY LETTER OF 6 JULY 1970

REMIMEO

DATA SERIES 13

IRRATIONALITY

Any and all irrationality is connected to departures from an ideal scene.

Therefore outpoints indicate departures.

It must follow then that rationality is connected to an ideal scene.

These three assumptions should be studied, observed and fully grasped.

They are very adventurous assumptions at first glance for if they are true then one has not only the definition of sanity in an organization or individual but also of neurosis and psychosis. One also sees that organizations or social groups or companies or any third dynamic (the urge to survival as a group) activity can be neurotic or psychotic.

It therefore would follow that the technology of the ideal scene, existing scene, departures, outpoints and statistics would contain or indicate the means of establishing sane groups or individuals or measuring their relative sanity or reestablishing relative sanity in them.

THE PLAGUE OF MAN

Man has been harassed by irrationality in individual and group conduct since there has been man.

The existing scene of man's activities is so immersed in departures and outpoints that at first survey there would seem to be no possible handling of the situation.

Most people have accepted the existing conditions as "inevitable" and toss them off with a "that's life."

This is of course an overwhelmed attitude.

And it is true that the departure from any ideal is so distant as to obscure any feeling of reality about possibly achieving an ideal scene even in a limited area.

Philosophies exist to "prove" that chaos is needful to furnish challenge. That is like saying "Be glad you're crazy" (as nineteenth-century psychologists *did* say). Or "Suffering refines one," as the playwrights of the early twentieth century so fondly used in their plots.

One whole religious order preached the necessity to accept man as he is.

Thus man is plagued with defeatism, has lacked technology, and civilization after civilization has succumbed, either in a flash of flame and war or in the slow erosion of grinding distress.

Most men, it has been said, live lives of quiet desperation.

One doesn't have to live through several wars to learn that man and his leaders are something less than sane.

Every sword-waving conqueror has exploited man's seeming inability to avoid brotherly slaughter and no conqueror or army seems to have noticed that wars only rarely shift boundaries no matter how many are killed. Europe for centuries has excelled in the development of marble orchards and failed remarkably to establish any lasting political scene at all.

In other lands government leaders, who should have at least a partial duty of preserving their citizenry have sat raptly listening to the advice of madmen for some centuries now. US leaders lately have taken to acting on the mental health guidance of many civilian committees, each one of which contains at least one member of an organization directly connected to Russia! The country most interested in fomenting US civil commotion! A former head of CIA once cracked for a joke, "What if there were a Russian KGB agent inside CIA?" The shudder of horror that went through US politicians was interesting to see. Yet every new employee of CIA was "vetted" before employment by members of two organizations connected to Russia! The "American" Psychological Association and the "American" Psychiatric Association are directed by the World Federation of Mental Health founded by Brock Chisholm, the companion of Alger Hiss and Whittaker Chambers, the famous US communist traitors. And the US government pays the WFMH to hold congresses which are attended by Russian KGB delegates. And all intelligence given the president on Vietnam, where the US was "fighting communism" was passed through the hands of a man whose parents are both Russian-born communists. And the US Defense Department intelligence on the same war was led and "coordinated" by another communist connected employee.

With that many outpoints showing up in their social welfare and intelligence scene, the US government seems something less than bright in wondering, "What riots?" "Why drugs?" "Why defeats?"

The statistics of the US welfare and social scene under the domination of the World Federation of Mental Health are soaring insanity, crime and riot graphs. It is so bad that Russia will never have to fight an atomic war. The US economic, political and social scene will deteriorate and is deteriorating so rapidly that the US will have lost any will to fight or any economic or social power to resist Russia.

(In case you wonder as to the factualness of data given above, it is all documented.)

I have given this existing scene so that you can see the outpoints. The deteriorated state of public safety in the US is well known. The fantastic sums it spends are well known.

I have given visible outpoints.

One glance at psychiatric and psychological statistics (which are all negative) would tell any sane person that they must be doing something else as they were given all the money, political power and authority ever needed to handle the scene. But it got *worse!* So, checking the scene for outpoints, one finds them directly connected to the No. 1 US enemy. Their data is marvelous for outpoints. Paid to serve the US, their literature discusses mainly abolishing boundaries and the Constitution.

The US official, so drowned in the chatter and confusion of double talk and false intelligence and situation reports, apparently cannot see any solution. And heaps money on his traitors and finances their avid destruction of the country.

Yet outpoints are so many and so visible that even the citizen sees them while the official remains apparently numb and inactive.

Very well, man can and does get drowned in his own irrationality. And his civilizations rise and fall.

Man's primary plague is irrationality. He is not in the grip of a "death wish," nor is he having a love affair with destruction. He has just lacked any road out or the technology to put him on it.

RESOLVING THE SCENE

All the US would have to do is count up the outpoints, look at the statistics, drop their passionate affair with Russian psychiatry, conceive an ideal scene of a productive America, rechannel welfare monies into decent public works to give people jobs and improve productivity per capita, knock off foreign funds and wars, give the money to increasing the value of American resources and even now the US would become all right. National production would catch up with destructive inflation, money would return to value and an ideal national scene would be approached. Even the military-industrial clique would be happy making bulldozers instead of tanks and youth would have a future in sight instead of a foreign-made grave. The odd part of it is, even the Senate and House would vote for such a program as their own statistic today is how much federal money can they bring home to their own states.

The only ones that would resist are the people who are the ones causing the above outpoints and who knowingly or unknowingly serve other masters than the US. And that's a simple security problem after all.

I have put the example on a large canvas just to show that the steps of handling departures are the same for all situations large or great.

When done this way, by the steps mentioned in the Data Series, big situations can be analyzed as well as little ones.

Available resources and all that play a part in getting the solution into effect. But the cost in time and action of the original effort to introduce the cycle of revertment to an ideal scene is not anywhere near as costly as *letting the departure continue*.

The EASIER thing to do in all cases is to work out the ideal scene, survey the existing scene for outpoints, work out statistics that *should* exist, find out WHY the departure, program a gradient solution back to the ideal, settle the practical aspects of it and go about it.

LOSING ONE'S WAY

One's direction is lost to the degree one fails to work out the ideal scene.

It is so easy to toss off an "ideal scene" that is not *the* ideal scene that one can begin with a false premise.

As he tries to work with an incorrect "ideal scene" for an activity he may fail and grow discouraged without recognizing that he is already working with an omitted datum — the *real* ideal scene for that activity.

This is a major reason one can lose one's way in handling a situation.

Also in trying to find a WHY of departure one may refuse to admit that something he himself did was the reason for the departure — or why the ideal scene never took place. It requires quite a bit of character to recognize one's own errors; it is much easier to find them in a neighbor. Thus one may choose the wrong WHY, for this and other reasons.

Failures to examine the scene, reasonableness which causes blindness to the obvious, errors of penetration and defensive reasons not to admit it all impede a proper analysis.

The existing scene may be missing in one's view because one doesn't really look at it or because one has no correct ideal scene for it.

Many would rather blame or justify than be honest. Others would rather criticize than work.

But this all adds up to outpoints in the examination itself.

If one keeps at it one will however arrive at the right answers with regard to any scene.

BUILDING THE IDEAL SCENE

To suppose one can instantly hit upon an ideal scene for any activity without further test is to be very fond of one's own prejudices.

There *is* however a test of whether you have the ideal scene or not.

Can you staticize it?

Strangely, but inevitably, since we live in the physical universe where there is both time and association of beings with beings and the physical universe and the physical universe with itself, there is a production-consumption factor in all living.

There seems to be a ratio between producing and consuming, and establishing it would probably resolve that strange subject, economics, as well as social welfare and other things.

It seems to be fatal to consume without producing. Many social observations teach us this.

Evidently one cannot, at the physical universe level, produce without consuming. And it seems that it is destructive to produce only and consume too little. One can produce far more than one consumes, apparently, but cannot consume far more than one produces.

This seems to be true of groups.

Some dreamers puffing on a hash pipe of unreality believe one can really be happy producing nothing and consuming everything. The idyllic ideal of a paradise where no one produces has been tried.

In interviewing secretaries in New York I found the larger percentage had the personal ideal scene of "marrying a millionaire." Aside from there not being that many millionaires, the dream of idle luxury forever was so far from any possible ideal scene that it was busy ruining their lives and giving their current male escorts a life of critical hell. One, having married a boy who was fast on the road to becoming a millionaire, was so dissatisfied with him not being one right now that she ruined his life and hers.

In short, it sounds nice, but having met a few who *did* marry millionaires, I can attest that they were either not producing and failing as beings or were working themselves half to death.

These no-production dreams, like the harp in heaven, lead at best to suicidal boredom. Yet Madison Avenue's ads would have one believe that one and all should own all manner of cloth, wood and metal just to be alive.

A whole civilization can break down, flop, on propaganda of no-production, total consumption. The sweat that flies off a "workers' paradise" would rival the Mississippi!

There *is* some sort of balanced ratio and it favors apparently, for pride and life and happiness, higher production of *something* than consumption. When it gets too unbalanced in *values,* something seems to happen.

The unhappiness and tumult in current society is oddly current with the Keynesian economic theory of creating want. It's a silly theory and has lately become to be abandoned. But it was in vogue forty years or more, as I recall. It produced the "welfare era" of the psychiatrist and the total slavery of the taxpayer!

So, whatever the economics of it, an ideal scene apparently *has* to have a statistic or the whole thing caves in, either from lack of continuity in time, from disinterest, or from plain lack of supply.

Death is possibly, could be in part, a cessation of interested production.

Hard pressed, a living being dreams of some free time. Give him too much and he begins to crave action and will go into production and if blocked from doing so will tend to cave in. Loss of a job depresses people way out of proportion and subsequent declines often trace back to it.

Destructive activities carry their own self-death. The state of veterans after wars is not always traced to wounds or privation. Destructive acts put a brand on a man.

Some of this is answered by the absence of production.

IDEAL SCENE AND STAT

Whatever the facts and economic rules may be about production and the ideal scene, it would seem to be the case, sufficient at least for our purposes, that this rule holds good:

> THE CORRECTLY STATED IDEAL SCENE WILL HAVE A PRODUCTION STATISTIC.

The way one defines "production" in this is not necessarily so many things made on an assembly line. That's an easy one.

It isn't just pairs of shoes. Production can be defined as the regulation or safeguarding of it, the planning or the designing of it, a lot, lot, lot of things.

A stat is a positive numerical thing that can be accurately counted and graphed on a two-dimensional thing.

To test the correctness of an ideal scene, one should be able to assign it a correct statistic.

If one can't figure out a statistic for it, then it probably is an incorrectly stated ideal scene and will suffer from departures.

Wrong stats assigned the ideal scene will wreck it. A wrongly conceived ideal scene will derail the activity quickly.

To understand something it is necessary to have a datum of comparable magnitude. To understand logic one needs to be able to establish what is illogic. One then has two things for comparison.

The ideal scene can be compared to an existing scene. This is one way to establish the ideal scene. But both need a factor to keep them in reality.

To test the ideal scene for correctness one needs to be able to formulate its statistic.

The exercise of testing the statement of the ideal scene, to keep it real and not airy-fairy and unattainable, is to work out a realistic stat for it.

One can go back and forth between the statistic and the stated ideal scene, adjusting one, then the other until one gets an attainable statistic that really does measure the validity of the stated ideal scene.

A statistic is a tight reality, a stable point, which is to measure any departure from the ideal scene.

In setting a statistic one has to outguess all efforts to falsify it (predict possible outpoints in collecting it) and has to see if following the statistic would mislead anyone from the ideal scene.

So let's walk back to the shoe store.

Test statement of ideal scene: to make money.

Test statistic: pairs of shoes sold.

Now if you tried to marry up those two you'd get a prompt catastrophe. The potential departure would be immediate.

We sell shoes at no profit to raise the stat, we make no money. We try only to make money, we sell cheap shoes at high cost and our customers don't come back and we don't make money.

So those two are both no good.

Departure would occur, indeed it already exists right in the badly worked out ideal scene and the stat.

Test ideal scene: cobblers are entitled to the shoes they make.

Test statistic: how many shoes cobbler makes.

So that's loopy!

Test ideal scene: all citizens furnished with shoes.

Test statistic: number of shoes given away.

Well, that's bonkers for a shoe *store* in any economic setup. The citizens for sure would have no shoes once the shoe store was empty, for if everything is *given* away, who'd raise cows for hides or drive nails in soles unless he had a gun held on him so what workers' paradise is this? Slave state for sure. So that's no ideal scene for a shoe store no matter how "ideal" it looks to a do-gooder. Too airy-fairy. Since no shoes would exist to be given away.

Test ideal scene: shoes for any worker who has coupons.

Test statistic: number of coupons collected.

Well, maybe. In some society. But can the shoe store get shoes for the coupons? Maybe if there's enough economic police.

But then this would have to be a monopoly shoe store and the quality would not be a factor.

So this must be an army quartermaster depot or a state monopoly. If no incentive were needed it would work. Sure would be hard on the corns but it would barely work. Rather insecure though.

But this is a shoe *store* where people buy.

Test ideal scene: to provide workers with good shoes that can be replaced from suppliers.

Test statistic: ??? Number of shoes from suppliers given to workers . . . Happy workers . . . ??? Amount of control that can be exerted on suppliers . . . ??? Ah. Number of shoes supplied well-shod workers.

Okay, that's a QM depot. Now what's a shoe *store?*

And we probably get what was given in an earlier example:

Ideal scene: to provide people with shoes and continue in business for owner's lifetime.

Statistic: percentage of citizens in area profitably shod by this store.

But even this would need to be played back and forth. And if this shoe store was in a socialist country both might require amendment. And if it was in a beach resort thronged with tourists who were also mostly foreigners the ideal scene and statistic would suffer an immediate departure and the store would fail, crash if the ideal scene were not correctly stated and the statistic real. The class of tourist would have a bearing on it.

Maybe the state has currency control demands on shopkeepers and requires them to get in foreign currency or no new stock!

Thus you could get:

Ideal scene: engendering acquisitiveness for novelty footwear made in this country.

Statistic: pairs of gift shoes bought by foreigners.

That sure would shift the whole atmosphere of the store!

Thus one plays the ideal scene against the statistic.

Maybe one can't find any ideal scene for the activity and no statistic of any significance to anyone. Could be that the activity is totally worthless even to oneself as a hobby. Although this opens the door to cynicism or a lazy way of not doing anything about anything, it just could be. Even a "reporter" who writes nothing could have an ideal scene and statistic. But it would have to be really real even then. Like,

Ideal scene: unsuspected as a spy while accepted as a "reporter."

Statistic: cash collected for reports undetectedly delivered to my government.

If that seems unreal as a scene the staff of *Time* magazine recently held a mass meeting protesting the use of *Time* credentials for government spying. "Nobody will talk to us anymore," the staff of that dying WFMH mouthpiece wept.

So anything could have an ideal scene, even a police state.

Ideal*ism* has nothing to do with it.

VIABLE

The word "viable" means capable of living, able to live in a particular climate or atmosphere.

Life over a period of time requires VIABILITY, or the ability to survive.

Any organism or any group or any part of a group must have a potential of survival. It must be viable — life-able.

This is true of any ideal scene. The statistic measures directly the relative survival potential of the organism or its part.

This tells you the plain fact that life contains the essential purpose of living, no matter how many misguided philosophers or generals may decree otherwise.

The planetary population is now not fully viable since weapons exist capable of making it a billiard ball at the whim of some madman.

The potential survival of the whole is of course an influence and limitation on its parts.

Men who live "only for self" don't live.

An organism or group can live a dangerous life in that it risks its survival. But its own inefficiency is more of a threat than its enemies if it does not know or adjust its ideal scene.

A military company, told on posters the ideal scene is all brag in the bar with girls on each arm, who find in fact that their actual scene is military police outside every bar with clubs and a real short life under the orders of a sadistically disinterested and inexpert government, is presented with an instantly visible departure.

The government believed such posters were needful to get recruits and did not realize that a truthfully stated scene and an effort to promote survival to commanders would also have recruited and conscription needn't be resorted to as the end product of lies.

Men will become part of the most onerous and dangerous groups imaginable providing the purpose is there and stated and they have a chance of survival.

The ideal scene of a nation worshiping death is that of a nation that will not survive anyway. At least not as that nation.

A group or an organism must be viable. The state is relative to the time the group needs to live to accomplish its purpose.

Each part of a group, in any ideal scene, should contribute viability to the whole group.

Production of something is mandatory on any part of a group if the group is to be fully viable.

Painting, writing, music, all have positive roles in a society. So productivity, as is viability, can be seen as a very broad inclusive term.

The *sub*purposes of any group make up the subideal scene of its various parts.

In other words each part of a broad group has its own ideal scene and its own statistic.

ORG BOARDS
INDEX

These combined bring about the broad group's ideal scene.

The statistics each lead to viability of the part and then the whole group.

In reverse, with so many parts of a planet desirous of extinguishing so many other parts, the viability of the planet becomes questionable.

In an organization each part has its own ideal scene and its own statistic on up to the main ideal scene and the main statistic.

In practice one works back from the ideal scene of the group into its smallest part, so that all lesser ideal scenes and lesser statistics mount up to and bring about the main ideal scene and statistic.

Examining the lesser ideal scenes and statistics, one can find outpoints first in how the whole thing is organized and then the main ideal scene and the statistics and how the lesser ones bring it about.

Dominant is the viability of the whole. Where any part does not support total viability it is an outpoint. Contributive is the viability of each part and cohesive is the scheme in which the lesser ideal scenes and the lesser statistics bring about the BIG ideal scene and the BIG statistic. If this does not occur the nonsupportive lesser ideal scene or statistic is an outpoint.

Groups that falter have to have all this restudied. As departures *did* occur, the organization itself, as part of any action, must be reexamined against experience and new greater and lesser ideal scenes and statistics must be worked out for it and put into use.

Agreement of the group is a necessary ingredient as many reformers have learned, often too late, and as many groups have seen, also generally too late.

The trick is to correct the ideal scene and statistic and all lesser ones of the group while it is still alive.

After that one can have better dependence upon them and keep the statistics up and the purpose going forward.

DATA SERIES 14

WORKING AND MANAGING

By actual experience in working and managing in many activities, I can state flatly that the most dangerous worker-manager thing to do is to work or manage from something else than statistics.

Interpersonal relations with many strata of many societies in many lands with many activities demonstrates plainly that man's largest and most unjust fault consists wholly of acting on opinion.

Opinions can be as varied as the weather in Washington, all on the same subject. When one says "opinion," one is dealing with that morass of false reports and prejudices which make up the chaos of current social orders.

Some seek an answer in status. "If one has STATUS, one is safe" is about as frail as a house of cards. Ask some recently deposed dictator or yesterday's idol what his status was worth. Yet many work exclusively for status. In Spain it is enough to have an executive *degree*. One doesn't have to do any executiving. Work at it? *Caramba* no!

In capitalisms it is enough to be an heir and in communisms it is only necessary to be the son of a commissar. Work? *Nyet!*

Revolts are protests against idle status. Where are the kings of yesteryear?

Riding along on the last generation's statistics is as fatal as a diet of thin air.

Undeserved status is a false statistic. Nothing is more bitterly resented, unless it is a statistic earned without status by those who live by status alone!

William Stieber, the most skilled intelligence chief of the nineteenth century, who won the Franco-Prussian War for Bismarck, was hated by German officers because he was not a proper officer but a civilian!

When German officers took over German intelligence they lost two wars in a row and the caste is very unlamentedly dead.

So long as "character" can be reviled, so long as "opinion" is used, so long as governments run on rumors and false reports, the social scene will continue to be a mess.

You will not believe it but governments think newspaper stories are "public opinion." One US president was astounded to be given a wildly enthusiastic public

reception at an airport. The press had been hammering him for a year and the poor fellow thought it was "public opinion." Texts on public relations remark this strange governmental fixation on believing the press.

That means all a nation's enemies have to do is bribe or hire some underpaid reporters or semibankrupt publishers, and *voilà!* it can steer the government any way it wishes!

Do a survey on any personality or subject and the conflicts in opinion are revealed as fantastic.

Seven witnesses to one street accident will even give seven conflicting accounts.

Thus this whole field of "opinion" and "reports" is a quicksand endangering both personal repute and management skill.

It is so bad that wars and revolutions stem directly from the use of opinion and the neglect of statistics.

In a chaos it is necessary to set up one point or terminal which is stable before one can really decide anything much less get anything done.

A statistic is such a stable point. One can proceed from it and use it to the degree that it is a correct statistic.

One can detect, then, when things start to go wrong well before they crash.

Using opinion or random rumors or reports one can go very wrong indeed. In fact, using these without knowing the statistics one can smash a life or crash a group.

The US Navy operates on the social attainments and civilized behavior of their people.

A naval officer is promoted on the basis of his amiability and the social skill of his wife!

A clerk is promoted because he marries the boss's daughter.

A governor is elected because he could play a guitar!

This is a whirlwind of chaos because of the falseness of the statistics used.

So the stat used is itself an outpoint in each case.

PREDICTION

Outpoints are more than useful in prediction.

The whole reason one does a data analysis and a situation analysis is to predict.

The biggest outpoint would be a missing ideal scene, the next biggest would be a correct statistic for it.

If these are missing then prediction can become a matter of telling fortunes with bamboo sticks.

One predicts in order to continue the viability of an organism, an individual, a group, an organization, a state or nation or planet, or to estimate the future of anything.

The more outpoints the less future.

A disaster could be said to be a totality of outpoints in final and sudden culmination.

This gives one a return to chaos.

The closer one approaches a disaster the more outpoints will turn up. Thus the more outpoints that turn up, the closer one is approaching a disaster.

When the outpoints are overwhelming, a condition of death is approached.

By being able to predict, the organism or individual or group can correct the outpoints before disaster occurs.

Each sphere of activity has its own prediction.

A group of different activities with a common goal can be predicted by the outpoints turning up in parts of the general activity.

In theory if all parts of a main group or organization had an ideal scene for each, a statistic and an intense interest in maintaining the ideal scene and statistic of each part, the survival would be infinite.

Any group or organism or individual is somewhat interdependent upon its neighbors, on other groups and individuals. It cannot however put them right unless it itself has reached some acceptable level of approach to its ideal scenes.

The conflict amongst organisms, individuals and groups does not necessarily add up to “the survival of the fittest,” whatever that meant. It does however mean that in such conflict the best chance of survival goes to the individual, organism or group that best approaches and maintains its ideal scene, lesser ideal scenes, statistic and lesser statistics.

REMIMEO

DATA SERIES 15

WRONG TARGET

There is an additional specific outpoint.

It is WRONG TARGET.

This means in effect AN INCORRECT SELECTION OF AN OBJECTIVE TO ATTEMPT OR ATTACK.

Example: Josie Ann has been sitting in the house reading. Her brother Oscar has been playing ball in the yard. A window breaks. Josie Ann's mother rushes into the room, sees Josie Ann and the ball on the floor, spanks Josie Ann.

This outpoint contains the element, amongst other things, of injustice.

There is another version of this:

Example: A firm has its premises flooded. The manager promptly insists on buying fire insurance.

Example: The people of Yangville are starving due to food scarcity in the land. The premier borrows 65 million pounds to build a new capital and palace.

Example: The government is under attack and riot and civil disorder spreads. The government officials campaign to put down all "rightists" for trying to establish law and order.

Example: A man is beaten and robbed on the main street of a town. The police demand to know why he was there and put him in jail for a long period of investigation.

Example: The multibillion-dollar drug cartels push out 65 tons of habit-forming hard drugs. A government campaigns against cigarettes.

Example: A boy wants to be an accountant. His family forces him to join the army as a career.

It is noted that the very insane often attack anyone who seeks to help them.

This outpoint is very fundamental as an illogic and is very useful.

INVESTIGATORY PROCEDURE

Correction of things which are not wrong and neglecting things which are not right puts the tombstone on any org or civilization.

In auditing when one reviews or "corrects" a case that is running well, one has trouble. It is *made* trouble.

Similarly on the third dynamic, correcting situations which do not exist and neglecting situations which *do* exist can destroy a group.

All this boils down to CORRECT INVESTIGATION. It is not a slight skill. It is THE basic skill behind any intelligent action.

SUPPRESSIVE JUSTICE

When justice goes astray (as it usually does) the things that have occurred are:

1. Use of justice for some other purpose than public safety (such as maintaining a privileged group or indulging a fixed idea) or

2. Investigatory procedure.

All suppressive use of the forces of justice can be traced back to one or the other of these.

Aberrations and hate very often find outlet by calling them "justice" or "law and order." This is why it can be said that man cannot be trusted with justice.

This or just plain stupidity bring about a neglect of intelligent investigatory procedures. Yet all third dynamic sanity depends upon correct and unaberrated investigatory procedures. Only in that way can one establish causes of things. And only by establishing causes can one cease to be the effect of unwanted situations.

It is one thing to be able to observe. It is quite another to utilize observations so that one can get to the basis of things.

SEQUENCES

Investigations become necessary in the face of outpoints or pluspoints.

Investigations can occur out of idle curiosity or particular interest. They can also occur to locate the cause of pluspoints.

Whatever the motive for investigation, the action itself is conducted by sequences.

If one is incapable mentally of tracing a series of events or actions, one cannot investigate.

Altered sequence is a primary block to investigation.

At first glance, omitted data would seem to be the block. On the contrary, it is the end product of an investigation and is what pulls an investigation along — one is looking for omitted data.

An altered sequence of actions defeats any investigation. Examples: We will hang him and then conduct a trial. We will assume who did it and then find evidence to prove it. A crime should be provoked to find who commits them.

Any time an investigation gets back-to-front, it will not succeed.

Thus if an investigator himself has any trouble with seeing or visualizing sequences of actions, he will inevitably come up with the wrong answer.

Reversely, when one sees that someone has come up with a wrong or incomplete answer, one can assume that the investigator has trouble with sequences of events or, of course, did not really investigate.

One can't really credit that Sherlock Holmes would say, "I have here the fingerprint of Mr. Murgatroyd on the murder weapon. Have the police arrest him. Now, Watson, hand me a magnifying glass and ask Sgt. Doherty to let us look over his fingerprint files."

If one cannot visualize a series of actions, like a ball bouncing down a flight of stairs, or if one cannot relate in proper order several different actions with one object into a proper sequence, he will not be able to investigate.

If one can, that's fine.

But any drilling with attention-shifting drills will improve one's ability to visualize sequences. Why? Stuck attention or attention that cannot confront alike will have trouble in visualizing sequences.

INVESTIGATIONS

In HCO Policy Letter 11 May 65 I, ETHICS OFFICER HAT; HCO Policy Letter 1 Sept. 65 VI, ETHICS PROTECTION; HCO Policy Letter 1 Feb. 66 II, INSPECTIONS BY EXECUTIVE SECRETARIES, HOW TO DO THEM; and pages 3, 4, 5 and 6 of the *Manual of Justice,** the subject of investigation as applied to justice is given.

It will be noted that these are *sequences* of actions.

Neglect of these items or a failure to know and follow them led here and there to suppressive uses of justice or to permitting orgs to be suppressed by special interest groups in the society.

*[*Editor's Note:* The *Manual of Justice* was written for HCO personnel in 1959. Most of the data in it later appeared in the book *Introduction to Scientology Ethics* and in policy letters from 1965 to 1966 on Ethics Officer duties.]

Indeed, had these been in and followed we would have had a great deal less trouble than we did.

But investigation is not monopolized by law and order.

All betterment of life depends on finding out pluspoints and why and reinforcing them, locating outpoints and why and eradicating them.

This is the successful survival pattern of living. A primitive who is going to survive does just that and a scientist who is worth anything does just that.

The fisherman sees sea gulls clustering over a point on the sea. That's the beginning of a short sequence, point number 1. He predicts a school of fish, point number 2. He sails over as sequence point number 3. He looks down as sequence point number 4. He sees fish as point number 5. He gets out a net as point number 6. He circles the school with the net, number 7. He draws in the net, number 8. He brings the fish on board, number 9. He goes to port, number 10. He sells the fish, number 11. That's following a pluspoint — cluster of sea gulls.

A sequence from an outpoint might be: Housewife serves dinner. Nobody eats the cake, number 1; she tastes it, number 2; she recognizes soap in it, number 3. She goes to kitchen, number 4. She looks into cupboard, number 5. She finds the soapbox upset, number 6. She sees the flour below it, number 7. She sees cookie jar empty, number 8. She grabs young son, number 9. She shows him the setup, number 10. She gets a confession, number 11. And number 12 is too painful to describe.

Unsuccessful investigators think good fish catches are sent by God and that when cake tastes like soap it is fate. They live in unsuccessful worlds of deep mystery.

They also hang the wrong people.

DISCOVERY

All discoveries are the end product of a sequence of investigatory actions that begin with either a pluspoint or an outpoint.

Thus all knowledge proceeds from pluspoints or outpoints observed.

And all knowledge depends on an ability to investigate.

And all investigation is done in correct sequence.

And all successes depend upon the ability to do these things.

DATA SERIES 17

NARROWING THE TARGET

When you look at a broad field or area it is quite overwhelming to have to find a small sector that might be out.

The lazy and popular way is to generalize. "They're all confused." "The organization is rickety." "They're doing great."

That's all very well but it doesn't get you much of anywhere.

The way to observe so as to find out what to observe is by discarding areas.

This in fact was the system I used to make the discoveries which became Dianetics and Scientology.

It was obvious to me that it would take a few million years to examine all of life to find out what made it what it was.

The first step was the tough one. I looked for a common denominator that was true for all life forms. I found they were attempting to survive.

With this datum I outlined all areas of wisdom or knowledge and discarded those which had not much assisted man to survive.

This threw away all but scientific methodology, so I used that for investigatory procedure.

Then, working with that found mental image pictures. And working with them found the human spirit as different from them.

By following up the workable, one arrived at the processing actions which, if applied, work, resulting in the increase of ability and freedom.

By following up the causes of destruction, one arrived at the points which had to be eradicated.

This is of course short-handing the whole cycle enormously. But that is the general outline.

Survival has been isolated as a common denominator to successful actions and succumb has been found as the common denominator of unsuccessful actions. So one does not have to reestablish these.

From there, to discover anything bad or good, all one has to do is discard sterile areas to get a target necessary for investigation.

One looks broadly at the whole scene. Then discards sections of it that would seem unrewarding. He will then find himself left with the area that contains the key to it.

This is almost easier done than described.

Example: One has the statistics of a nine-division org. Eight are normal. One isn't. So he investigates the area of that one. In investigating the one, he discards all normal bits. He is left with the abnormal one that is the key.

This is true of something bad or something good.

A wise boy who wanted to get on in life would discard all the men who weren't getting on and study the one who was. He would come up with something he could use as a key.

A farmer who wanted to handle a crop menace would disregard all the plants doing all right and study the one that wasn't. Then, looking carefully, he would disregard all the should be's in that plant and wind up with the shouldn't be. He'd have the key.

Sometimes in the final look one finds the key not right there but way over somewhere else.

The boy, studying the successful man, finds he owed his success to having worked in a certain bank seven states away from there.

The farmer may well find his hired man let the pigs out into the crop.

But both got the reason why by the same process of discarding wider zones.

Pluspoints or outpoints alike take one along a sequence of discoveries.

Once in a purple moon they mix or cross.

Example: Gross income is up. One discards all normal stats. Aside from gross income being up, only one other stat is down — new names. Investigation shows that the public executives were off post all week on a tour and *that* was what raked in the money. Conclusion — send out tours as well as man the public divisions.

Example: Upset is coming from the camp kitchen. Obvious outpoints. Investigation discloses a 15-year-old cook holding the job solo for 39 field hands! Boy is he pluspoint. Get him some help!

DRAWN ATTENTION

Having attention dragged into an area is about the way most people "investigate." This puts them at effect throughout.

When a man is not predicting, he is often subjected to outpoints that leap up at him. Conversely, when outpoints leap up at one unexpectedly he knows he better do more than gape at them. He is already behindhand in investigating. Other signs earlier existed which were disregarded.

ERRORS

The usual error in viewing situations is not to view them widely enough to begin with.

One gets a despatch which says Central Files don't exist.

By now keeping one's attention narrowly on that, one can miss the whole scene.

To just order Central Files put back in may fail miserably. One has been given a single observation. It is merely an outpoint: Central Files omitted.

There is no WHY.

You follow up "no CF" and you may find the Registrar is in the Public Division and Letter Registrars never go near a file and the category of everyone in CF is just "been tested." You really investigate and you find there's no HCO Exec Sec or Dissem Sec and there hasn't been one for a year.

The cycle of "Outpoint, correct. Outpoint, correct. Outpoint, correct" will drown one rapidly and improve nothing! But it sure makes a lot of useless work and worry.

WISDOM

Wisdom is not a fixed idea.

It is knowing how to use your wits.

DATA SERIES 18

SUMMARY OF OUTPOINTS

OMITTED DATA

An omitted anything is an outpoint.

This can be an omitted person, terminal, object, energy, space, time, form, sequence or even an omitted scene. Anything that *can* be omitted that *should* be there is an outpoint.

This is easily the most overlooked outpoint as it isn't there to directly attract attention.

On several occasions I have found situation analyses done which arrived at no WHY that would have made handling possible but which gave a false Why that would have upset things if used. In each case the outpoint that held the real clue was this one of an omitted something. In a dozen cases it was omitted personnel each time. One area to which orders were being issued had no one in it at all. Others were undermanned, meaning people were missing. In yet another case there were no study materials at all. In two other cases the whole of a subject was missing in the area. Yet no one in any of these cases had spotted the fact that it was an omitted something that had caused a whole activity to decay. People were working frantically to remedy the general situation. None of them noticed the omissions that were the true cause of the decay.

In crime it is as bad to *omit* as it is to commit. Yet no one seems to notice the omissions as actual crimes.

Man, trained up in the last century to be a stimulus-response animal, responds to the therenesses and doesn't respond as uniformly to not-therenesses.

This opens the door to a habit of deletion or shortening which can become quite compulsive.

In any analysis which fails to discover a WHY, one can safely conclude the Why is an omission and look for things that *should* be there and aren't.

ALTERED SEQUENCE

Any things, events, objects, sizes, in a wrong sequence is an outpoint.

The number series 3, 7, 1, 2, 4, 6, 5 is an altered sequence, or an incorrect sequence.

Doing step two of a sequence of actions before doing step one can be counted on to tangle any sequence of actions.

The basic outness is no sequence at all. This leads into FIXED IDEAS. It also shows up in what is called disassociation, an insanity. Things connected to or similar to each other are not seen as consecutive. Such people also jump about subjectwise without relation to an obvious sequence. Disassociation is the extreme case where things that are related are not seen to be and things that have no relation are conceived to have.

Sequence means linear (in a line) travel either through space or time or both.

A sequence that should be one and isn't is an outpoint.

A "sequence" that isn't but is thought to be one is an outpoint.

A cart-before-the-horse out of sequence is an outpoint.

One's hardest task sometimes is indicating an inevitable sequence into the future that is invisible to another. This is a consequence. "If you saw off the limb you are sitting on you will of course fall." Police try to bring this home often to people who have no concept of sequence; so the threat of punishment works well on well-behaved citizens and not at all on criminals since they often are criminals because they can't think in sequence — they are simply fixated. "If you kill a man you will be hanged," is an indicated sequence. A murderer fixated on revenge cannot think in sequence. One has to think in sequences to have correct sequences.

Therefore it is far more common than one would at first imagine to see altered sequences since persons who do not think in sequence do not see altered sequences in their own actions or areas.

Visualizing sequences and drills in shifting attention can clean this up and restore it as a faculty.

Motion pictures and TV were spotted by a recent writer as fixating attention and not permitting it to travel. Where one had TV-raised children, it would follow, one possibly would have people with a tendency to altered sequences or no sequences at all.

DROPPED TIME

Time that should be noted and isn't would be an outpoint of "dropped time."

It is a special case of an omitted datum.

Dropped time has a peculiarly ferocious effect that adds up to utter lunacy.

A news bulletin from 1814 and one from 1922 read consecutively without time assigned produces otherwise undetectable madness.

A summary report of a situation containing events strung over half a year without saying so can provoke a reaction not in keeping with the current scene.

In madmen the present is the dropped time, leaving them in the haunted past. Just telling a group of madmen to "come up to present time" will produce a few miraculous "cures." And getting the date of an ache or pain will often cause it to vanish.

Time aberrations are so strong that dropped time well qualifies as an outpoint.

FALSEHOOD

When you hear two facts that are contrary, one is a falsehood or both are.

Propaganda and other activities specialize in falsehoods and provoke great disturbance.

Willful or unintentional, a falsehood is an outpoint. It may be a mistake or a calculated or defensive falsehood and it is still an outpoint.

A false anything qualifies for this outpoint. A false being, terminal, act, intention, anything that seeks to be what it isn't is a falsehood and an outpoint.

Fiction that does not pretend to be anything else is of course not a falsehood.

So the falsehood means "other than it appears" or "other than represented."

One does not have to concern oneself to define philosophic truth or reality to see that something stated or modeled to be one thing is in actual fact something else and therefore an outpoint.

ALTERED IMPORTANCE

An importance shifted from its actual relative importance, up or down, is an outpoint.

Something can be assigned an importance greater than it has.

Something can be assigned an importance less than it has.

A number of things of different importances can be assigned a monotone of importance.

These are all outpoints, three versions of the same thing.

All importances are relative to their actuality.

WRONG TARGET

Mistaken objective wherein one believes he is or should be reaching toward A and finds he is or should be reaching toward B is an outpoint.

This is commonly mistaken identity. It is also mistaken purposes or goals.

If we tear down X we will be okay often results in disclosure that it should have been Y.

"Removing the slums" to make way for modern shops kills the tourist industry. Killing the king to be free from taxation leaves the tax collector alive for the next regime.

Injustice is usually a wrong target outpoint.

Arrest the drug consumer, award the drug company would be an example.

Military tactics and strategy are almost always an effort to coax the selection of a wrong target by the enemy.

And most dislikes and spontaneous hates in human relations are based on mistaken associations of Bill for Pete.

A large sum of aberration is based on wrong targets, wrong sources, wrong causes.

Incorrectly tell a patient he has ulcers when he hasn't and he's hung with an outpoint which impedes recovery.

The industry spent on wrong objectives would light the world for a millennium.

SUMMARY

These are the fundamental outpoints required in data analysis and situation analysis.

They have an infinity of variation. They should be very well known to anyone seeking third dynamic sanity.

They are the basic illogics.

And while there may be others, these will serve.

DATA SERIES 19

THE REAL WHY

"WHY" as used in logic is subject to noncomprehension.

WHY = that basic outness found which will lead to a recovery of stats.

WRONG WHY = the incorrectly identified outness which when applied does not lead to recovery.

A MERE EXPLANATION = a *"Why"* given as THE Why that does not open the door to any recovery.

Example: A mere explanation: "The stats went down because of rainy weather that week." So? So do we now turn off rain? Another mere explanation: "The staff became overwhelmed that week." An order saying "Don't overwhelm staff" would be the possible "solution" of some manager. BUT THE STATS WOULDN'T RECOVER.

The *real* WHY when found and corrected leads straight back to improved stats.

A wrong Why, corrected, will further depress stats.

A mere explanation does nothing at all and decay continues.

Here is a situation as it is followed up:

The stats of an area were down. Investigation disclosed there had been sickness two weeks before. The report came in: "The stats were down because people were sick." This was a mere explanation. Very reasonable. But it solved nothing. What do we do now? Maybe we accept this as the correct Why. And give an order, "All people in the area must get a medical exam and unhealthy workers will not be accepted and unhealthy ones will be fired." As it's a correction to a wrong Why, the stats *really* crash. So that's not it. Looking further we find the real WHY. In the area there is no trained-in org bd and a boss there gives orders to the wrong people which, when executed, then hurt their individual stats. We org board the place and groove in the boss and we get a stat recovery and even an improvement.

The correct WHY led to a stat recovery.

Here is another one. Stats are down in a school. An investigation comes up with a mere explanation: "The students were all busy with sports." So management says "No sports!" Stats go down again. A new investigation comes up with a wrong Why: "The students are being taught wrongly." Management sacks the dean. Stats really crash

now. A further more competent investigation occurs. It turns out that there were 140 students and only the dean and one instructor! And the dean had other duties! We put the dean back on post and hire two more instructors making three. Stats soar. Because we got the right Why.

Management and organizational catastrophes and successes are ALL explained by these three types of Why. An arbitrary is probably just a wrong Why held in by law. And if so held in, it will crash the place.

One really has to understand logic to get to the correct WHY and must really be on his toes not to use and correct a wrong WHY.

In world banking, where inflation occurs, finance regulations or laws are probably just one long parade of wrong Whys. The value of the money and its usefulness to the citizen deteriorate to such an extent that a whole ideology can be built up (as in Sparta by Lycurgus who invented iron money nobody could lift in order to rid Sparta of money evils) that knocks money out entirely and puts nothing but nonsense in its place.

Organizational troubles are greatly worsened by using mere explanations (which lead to no remedies) or wrong Whys (which further depress stats). Organizational recoveries come from finding the real WHY and correcting it.

The test of the real WHY is "When it is corrected, do stats recover?" If they do, that was it. And any other remedial order given but based on a wrong Why would have to be cancelled quickly.

DATA SERIES 20

MORE OUTPOINTS

While there could be many many oddities classifiable as outpoints, those selected and named as such are major in importance whereas others are minor.

WRONG SOURCE

"Wrong source" is the other side of the coin of wrong target.

Information taken from wrong source, orders taken from the wrong source, gifts or materiel taken from wrong source all add up to eventual confusion and possible trouble.

Unwittingly receiving from a wrong source can be very embarrassing or confusing, so much so that it is a favorite intelligence trick. Dept D in East Germany, the Dept of Disinformation, has very intricate methods of planting false information and disguising its source.

Technology can come from wrong source. For instance Leipzig University's school of psychology and psychiatry opened the door to death camps in Hitler's Germany. Using drugs, these men apparently gave Hitler to the world as their puppet. They tortured, maimed and slaughtered over 12,000,000 Germans in death camps. At the end of World War II these extremists formed the "World Federation of Mental Health," which enlisted the American Psychiatric Association and the American Medical Association and established "National Associations for Mental Health" over the world, cowed news media, smashed any new technology and became the sole advisers to the US government on "mental health, education and welfare" and the appointers of all health ministers through the civilized world, and through their graduate Pavlov dominated Russian communist "mental health." This source is so wrong that it is destroying man, having already destroyed scores of millions. (All statements given here are documented.)

Not only taking data from wrong source but officialdom from it can therefore be sufficiently aberrated as to result in planetary insanity.

In a lesser level, taking a report from a known bad hat and acting upon it is the *usual* reason for errors made in management.

CONTRARY FACTS

When two statements are made on one subject which are contrary to each other, we have "contrary facts."

Previously we classified this illogic as a falsehood, since one of them must be false.

But in doing data analysis one cannot offhand distinguish which is the false fact. Thus it becomes a special outpoint.

"They made a high of $12,000 that week" and "They couldn't pay staff" occurring in the same time period gives us one or both as false. We may not know which is true but we do know they are contrary and can so label it.

In interrogation this point is so important that anyone giving two contrary facts becomes a prime suspect for further investigation. "I am a Swiss citizen" as a statement from someone who has had a German passport found in his baggage would be an example.

When two "facts" are contrary or contradictory, we may not know which is true but we do know they can't both be true.

Issued by the same org, even from two different people in that org, two contradictory "facts" qualifies as an outpoint.

These two will be found useful in analysis.

DATA SERIES 21
DATA SERIES AUDITING

Refs:

HCOB	28 Aug. 70RB Rev. 27.1.81	HC OUTPOINT–PLUSPOINT LISTS RB
HCOB	24 July 70	DATA SERIES

Whenever a student cannot grasp or retain the data of the DATA SERIES policy letters, he must be audited on the Data Series Rundown (also called the HC Outpoint–Pluspoint Lists).

The reason for this is that he himself has OUTPOINTS and it is necessary to *audit* him on this subject.

When the student has outpoints, it has been found that he has a terrible time grasping or retaining the Data Series material.

This does not mean the student is in any way crazy. It just means he is illogical and has outpoints in his thinking.

This will reflect as well in his other studies.

So handling this is a vital action.

DATA SERIES 22

THE WHY IS GOD

When beings operate mainly on illogics, they are unable to conceive of valid reasons for things or to see that effects are directly caused by things they themselves can control.

The inability to observe and find an actual usable WHY *is* the downfall of beings and activities. This is factually the WHY of people not finding WHYS and using them.

The prevalence of historical man's use of "fate," "kismet" (fatalism), superstition, fortunetelling, astrology and mysticism confirms this.

Having forgotten to keep seed grain for the spring, the farmer starves the following year and when asked WHY he is starving says it is the gods, that he has sinned or that he failed to make sacrifice. In short, unable to think, he says "The Why is God."

This condition does not just affect primitives or backward people.

All through the most modern organizations you can find "The WHY is God" in other forms.

By believing that it is the fault of other divisions or departments, a staff member does not look into his *own* scene. "The reason I cannot load the lumber is because 'the Personnel Section' will not find and hire people." It does not seem to occur to this fellow that he is using a WHY which he can't control so it is *not* a WHY for his area. It does not move the existing to the ideal scene. Thus it is not a WHY for him. Yet he will use it and go on nattering about it. And the lumber never gets loaded. The real WHY for him more likely would be, "I have no right to hire day laborers. I must obtain this right before my area breaks down totally," or "My department posts are too specialized. I need to operate on all hands actions on peak loads."

A Course Supervisor who says, "I haven't got any students because Ethics keeps them for weeks and Cramming for months" is using a "The Why is God." As he cannot control Ethics or Cramming from his post, his WHY is illogical. The real WHY is probably "I am not mustering all my students daily and keeping them on course. If they are ordered to Ethics or Cramming, they must be right here studying except for the actual minutes spent in Ethics and Cramming."

But this does not just apply on small activities. It applies to whole nations. "The reason we Germans cannot advance is because England is against us." This wrong WHY has killed many tens of millions in two world wars.

Intelligence organizations are often almost dedicated to "the Why is over there." It seldom is.

Most staffs of orgs, when pay is poor, are completely addicted to over-thereness. In one org, the Finance Banking Officer was continuously hammered to "give more money" by the people who were responsible for making the money and yet who were not raising a finger to do so. An actual survey of four org staffs showed that only 2 percent were aware that their pay depended upon the org gross income!

Thus survival is very closely tied to logic. If one finds he is sinking into apathy over his inability to get his job done, it is *certain* that he is operating on self-conceived wrong WHYS in areas that he cannot ever hope to control.

And in living any life, most major points of decline can be traced to the person's operating on Whys that do not allow him to improve his own scene.

The Greek cut open the guts of birds to find the WHY. He called this "divination" or "augury." Don't look now, but that civilization has long been dead!

Just as anyone will be whose illogic leads him to over-thereness to find his Whys.

Strength and power in the individual consists of being logical enough to find WHYs *he* can use to advance his existing scene toward the ideal scene.

The Why is NOT God. It lies with YOU and your ability to be logical.

God helps those who help themselves.

HCO POLICY LETTER OF 17 FEBRUARY 1972

REMIMEO

DATA SERIES 23

PROPER FORMAT AND CORRECT ACTION

When doing an evaluation, one can become far too fixated on outpoints and miss the real reason one is doing an evaluation in the first place.

To handle this, it is proper form to write up an evaluation so as to keep in view the reason one is doing one.

This is accomplished by using this form:

SITUATION: _____
_____

DATA: _____
_____

STATS: _____
_____

WHY: _____
_____

IDEAL SCENE: _____
_____

HANDLING: _____
_____

CONSISTENCY

The whole of it should concern itself with the same general scene, the same subject matter. This is known as CONSISTENCY. One does not have a Situation about books, Data about bicycles, Stats of another person, a WHY about another area, a different subject for Ideal Scene and Handling for another activity.

The Situation, whether good or bad, must be about a certain subject, person or area, the Data must be about the same, the Stats are of that same thing, the WHY relates to that same thing, the Ideal Scene is about the scene of that same thing and the Handling handles that thing and *especially* is regulated by that Why.

A proper evaluation is all of a piece.

SITUATION

First, to do an evaluation, some situation must have come to notice. There is a report or observation that is out of the ordinary.

This "coming to notice" occurs on any line. Usually it is fairly major, affecting a large portion of the area, but it can be minor.

So OBSERVATION in general must be continuous for situations to be noted.

To just note a situation and act on it is out of sequence as it omits evaluation. You can be elated or shocked uselessly by noting a situation and then not doing any evaluation.

It is the hallmark of a rank amateur or idiot to *act* on reports without any evaluation.

So, the first step is noting, from general alertness, a situation exists.

A situation is defined as a not expected state of affairs. It is either very good or it is very bad.

If it is very good, it must be evaluated and a Why found so one can even upgrade an ideal scene.

If it is very bad, it must be evaluated and a Why found so that it can be handled to more closely approach the ideal scene.

DATA

Data is the information one has received that alerts one to the situation.

Intelligence systems use various (mainly faulty) methods of "evaluating" data so as to "confirm it." They do this uniformly from *reports*. No matter how many reports one may see, there is *always* a question as to their truth. Intelligence chiefs have started most wars (US vs. Germany 1917) or failed to start them in time (US vs. Japan 1936) by depending on "authoritative sources," "skilled observers," "valid documents" and other confetti they class as "reports" or "documents."

As noted above, the "raw document" or "raw materials" as they are called have led, when accepted, to the most terrifying catastrophes. British Admiral Hall, without permission of the British government, leaked the famous "Zimmermann telegram" to US President Wilson and stampeded the US into World War I. The alleged German "instructions" to their US Ambassador "intercepted" by Hall were passed on with confidence tricks and President Wilson, elected to keep the US out of the war, being no great evaluator, dived overboard on one flimsy questionable report and carried America into the disaster of two world wars and a communist supremacy.

The US was lulled by false Japanese assurances and false data on the smallness of Japanese armaments and considered the country no danger. The true situation would have led to a US declaration of war in 1936! Before Japan could sink the whole Pacific fleet in one raid and cause 4½ years of war and open all of China to communist supremacy.

These are just a couple of the thousands of disasters in international affairs brought about by a pathetic reliance on reports or documents.

If you knew the game well, with a half a dozen agents and a document factory, you could have half the countries of the planet in turmoil. Because they rely on *reports* and "authoritative sources" and "expert opinion" instead of data as viewed in this Data Series.

If one does not court disaster and failures, one does NOT rely on reports, but an absence of reports or a volume of reports carefully surveyed for outpoints and counted.

To do this one must be VERY skilled at spotting outpoints. Most people confuse simple errors with actual outpoints.

You can get so good at this you can recognize outpoints and pluspoints at a fast glance over reports.

Essentially, "data" regarded from the angle of outpoints is a lack of consistency. "Our Div 2 is doing very well" doesn't go with gross income $2.

This gives you a guideline, the "string to pull" (see investigation checksheet on following down things you just don't understand, the first emergence of the Data Series).

So the DATA you give is not a lot of reports. It is a brief summary of the "strings pulled" on the outpoint or pluspoint route to finally get the Why.

Example: (from a situation where an org was going broke) "The sign-ups reported for service and new names to Central Files were both high yet gross income was down. An investigation of the service area showed no backlogs and no new customers with the staff idle. Tech Services was fully staffed. Examining complement showed no one in the Department of Income. People were signed up but there was no one to receive the money." The WHY of course was a wrong complement, particularly NO CASHIER and an Executive Director neglecting his duties.

Example: (on a situation of a stat soaring) "The Promo Dept had very down stats with no promo going out. Bulk mail was low. Div 6 was idle, yet the GI was soaring. Nothing in the org could be found to account for it. Investigation of what promo incoming public had showed that the promo was coming from a lower-level org promoting itself as a route to upper-level services." The WHY of course was an effective promo campaign being run OUTSIDE the org. And one could bolster that up and get the org active too.

DATA, then, is the Sherlock Holming of the trail that gave the WHY. It at once reflects the command the evaluator has of the DATA SERIES. And his own cleverness.

Sometimes they come in a sudden blue flash a yard long, a piece of insight into what MUST be going on if these outpoints add up this way. Rapid investigation of further data on this trail proves or disproves the flash of insight. One does NOT run on insight alone (or crystal balls).

To one not trained and practiced in evaluation the finding of a REAL WHY may look as mysterious as an airplane to an aborigine.

It is a fact that people who do not understand evaluation can get the idea that management acts on personalities or whims or that management has spies everywhere to know that the Distribution Secretary never came to work.

To the expert it is easy. To the ignorant it looks very supernatural.

It is the TRAIL followed that counts.

This is what is required under "DATA."

STATS

Situations and DATA trails are supported by statistics.

Where statistics are not in numeral form, this may be harder. Where they are outright lies, this is an outpoint itself.

A person or nation without any statistic may be a puzzle at first but statistical approximations can exist and be valid.

Statistics of CIA would be very hard to dig up. They don't even let the US Congress in on it. But the deteriorating overseas influence of the US would show that CIA was not batting any high average and that its data fed to policymakers (its avowed purpose) might well be false or misleading, causing policy errors that cause a deteriorating scene.

So statistics can be estimated by the scene itself even when absent in numerical form.

England has lost its whole empire in a quarter of a century, without a single defeat in war. This gives an adequate statistic for the government's good sense or lack of it. It is at this writing losing even parts of the homeland and is itself joining what might be called the Fourth Reich and so will soon cease to exist as a political sovereignty. This statistic can even be drawn as a divebombing down curve.

A deckhand's statistic may not exist on a chart but the areas he tends do exist for view.

One either has a numerical statistic or a direct observation. One can use both.

I once answered the question, "Why are paid completions high and gross income low?" by finding that the "paid" completions stats were false.

So one statistic can be compared to another.

Three or more stats can be compared to each other and often lead directly to a WHY.

The main point is DON'T ACT WITHOUT STATISTICAL DATA.

After a fine data analysis, one may well find the stats are quite normal and there is NO situation.

One may have a great PR PR PR data analysis and collide with statistics you'd need a submarine to read.

And one may have data that says the whole staff of Keokuk should be shot without waiting for dawn and then discover that, by stats, they're doing great.

And one can also do a data analysis that shows somebody should be commended and prove it by stats and then discover belatedly the stats are false and the guy should have been shot.

However, if one looks at all available stats after doing a data analysis one may find they look good at a glance but are sour as green apples. One could see a high lot of stats, GI, etc., and *then* see a cost stat that shows someone is making $2 million at a cost of $4 million and that the place is going straight into the garbage can.

DO NOT give a Why or recommend handling without inspecting the actual stats.

And DO NOT be thrown off a situation you are sure exists without looking at ALL the stats. (Example: High hour interns' stats throw one off interfering until one sees NO interns graduating and NO programs completed by them.)

THE WHY

This is the jewel in the crown, the main dish at dinner, the gold mine in the towering mountains of mystery.

A real WHY *must* lead to a bettering of the existing scene or (in the case of a wonderful new scene) maintaining it as a new ideal scene.

Therefore the WHY must be something you can do something about. (See THE WHY IS GOD policy letter.)

Thus the Why is limited by what *you* can control. It is NEVER that other division or top management or the bumps on the moon.

Even if all this were true, the WHY must be something which

YOU CAN DO SOMETHING ABOUT YOURSELF FROM YOUR LEVEL OF AUTHORITY OR INITIATIVE that will lead to

THE IMPROVEMENT OF A POOR EXISTING SCENE TOWARD THE IDEAL SCENE.

The WHY is a special thing then. It is a key that opens the door to effective improvement.

It is not a prejudice or a good idea. It is where all the analysis led.

And a REAL Why when used and handled and acted upon is like a magic carpet. The scene at once becomes potentially better or gets maintained.

"Acting on a wrong Why" is the stuff of which coffins are made.

No matter how brilliant the program that follows, there it is, the same old mud.

Wrong Whys work people half to death handling a program which will lay ostrich eggs and rotten ones at that.

It will cost money and time that can't be afforded easily.

It will distract from the real tiger in the woods and let him roar and eat up the goats while everyone is off chasing the ghosts which "really were the cause of it all."

Wrong Whys are the tombstones of all great civilizations and unless someone gears up the think will be the mausoleum of this one.

Do not think you won't get them. It takes 28,000 casualties in battle, they say, to make a major general. Well it may take a few wrong Whys to make an evaluator.

The evaluator who has done the evaluation is of course responsible for it being correctly done and leading to the right conclusion and verified by stats to give the correct real WHY.

And the real ones are often too incredible to have been arrived at in any other way. Or they are so obvious no one noticed.

In one instance Whys were found by experts for six months on a certain course without improving the flagrantly bad situation but actually messing it up more until a huge real Why jumped out (the students had never been trained on earlier levels) and the situation began to improve.

Using one Why for all situations can also occur and fads of Whys are common. True, a Why often applies elsewhere. That's what gives us technology including policy. But in any area of operation where a situation is very abnormal the Why is likely to be very peculiar and too off the ordinary to be grasped at once.

There can be an infinity of wrongnesses around just one rightness. Thus there can be an infinity of wrong Whys possible with just one real Why that will open the door.

For the real Why *does* open the door. With it on a good situation one can maintain it and with a bad situation one can improve it.

Thus the REAL WHY is the vital arrival point to which evaluation leads.

THE IDEAL SCENE

If a bad situation is a *departure* from the ideal scene and if a good situation is attaining it or exceeding it, then the crux of any evaluation is THE IDEAL SCENE for the area one is evaluating.

Viewpoint has a lot to do with the ideal scene.

To Russia a collapsed America is the ideal scene. To America a collapsed Russia is an ideal scene.

To some have-not nations both Russia and the US competing at vast expense for the favor of a coy petty ruler is the ideal scene to that ruler.

To most other parts of the world both these major countries interested *only* in their own affairs would be an ideal scene.

So, with viewpoint the ideal scene can be "bad" or "good."

The ideal scene is not necessarily big and broad. An intelligence evaluator that gave the ideal scene as "a defeated enemy" on every evaluation would be very inexpert.

By CONSISTENCY the ideal scene must be one for that portion of an activity for which one is trying to find the Why.

Example: (Situation: Renewed activity on a front held by one platoon. Evaluation: No other points along the lines are active and a tank road leads toward the front where the activity is. WHY: Area being prepared for a tank breakout.) IDEAL SCENE: An uninhabitable area in front of the platoon. (Which could be done with napalm as there is a wood there and a heavy crossfire maintained and a renewed supply of bazookas for the platoon if the napalm didn't work.)

Example: (Situation: A lot of silence from Plant 22. Evaluation: No trucks arriving with materials, no raw materials being sent by outside suppliers, suppliers irate. WHY: The accounting office forgot to pay the raw materials bill and the suppliers held up all further supplies.) THE IDEAL SCENE: High credit rating and good accounts PR established with all creditors. (And handling would include a recommendation for an evaluation of the accounting office as to why it forgot and why there is no high credit PR with a new ideal scene for that accounting office, which might be a wholly different thing: IDEAL SCENE: An accounting office that enforces income greater than outgo.)

By giving the IDEAL SCENE for every situation, the evaluator is not led into a fatal contempt for the competence of all work actually being done.

The ideal scene clarifies for one and all whither we are going.

But even more important, the evaluation that includes an ideal scene postulates a win from the viewpoint of those for whom it is being done or for one's activities.

Sometimes when one gets to the ideal scene and writes it down he finds his Why won't really lead to it, in which case he must get another Why or familiarize himself with the scene in general to find out what he is trying to send where.

In the case of an abnormally good situation one finds he has exceeded what was formerly thought to be the ideal scene and must state a new one entirely with the WHY concerned with how to maintain it.

Anyone reading a full evaluation in proper form can better estimate whether the WHY and handling are workable if the IDEAL SCENE is there. And sometimes it will be found that the evaluator is trying to do something else entirely than what everyone else thinks is a correct attainment.

Thus it is a very healthy thing to include the ideal scene. It serves as a discipline and incentive for the evaluator and those executing the program.

HANDLING

Handling must be CONSISTENT with the Situation, the evaluation, the Why and the Ideal Scene.

Handling must be WITHIN THE CAPABILITIES of those who will do the actions.

Handling must be WITHIN THE RESOURCES AVAILABLE.

Handling quite often but not always requires a BRIGHT IDEA. It is peculiarly true that the less the resources available the brighter the idea required to attain effective handling.

Handling must be SUPERVISED by one person who acts as a coordinator of the program and a checker-offer and debug expert.

And last but most important handling must be EFFECTIVE AND FINAL.

The *steps* of Handling are in Program Form. They are numbered 1, 2, 3, etc. Or A, B, C, etc.

They can be in the sequence they will be done but this is mostly important when one person or one team is going to do the whole thing step by step.

These steps are called TARGETS.

Each part of the program (each TARGET) is assigned to someone to do or to get done.

Care must be taken not to overload persons already loaded and where this occurs one appoints a special personnel or mission for that specific target.

The supervision must see that each target gets fully done and no targets not done and no targets half done.

It is up to supervision to keep track of all completions on a MASTER sheet.

Supervision debugs those targets that bog or lag by finding in them a Why, which may mean a rapid evaluation of that target to rephrase it or get it clarified without altering its intended accomplishment.

Supervision can reassign a target.

PROJECTS

It is expected that any complex or extensive target will have a PROJECT written for it by the person to whom it is assigned if not by the originator.

By completing this Project the target is DONE.

Often these projects have to be passed upon by a senior before being begun.

COMPLIANCE

When the MASTER sheet shows all targets DONE (not not done and not half done and not falsely reported) full situation handling can be expected.

REVIEW

When the supervisor reports all targets done, it is in the hands of fate whether the situation will now be progressed toward or attain the ideal scene.

The accuracy of the data, the skill of the evaluator, the correctness of the WHY, the competence of the supervisor and the skill of those executing the targets and the willingness of those receiving the effects of all this activity (their human emotion and reaction) determine whether this evaluation approaches or attains the ideal scene.

All such evaluations should be REVIEWED as soon as the actions have had time to take effect.

An idiot optimism can suppose all is well and that it is needless to review.

But if this WHY was wrong *then the situation will deteriorate* and a worsening situation will be apparent.

Thus a sharp watch has to be set. No thirst for "always being right" or arrogance about never being wrong must prevent an honest review.

WAS the ideal scene approached or attained?

Or was it a wrong Why and now is all Hades breaking loose?

Now we *don't* have just renewed insistence that the WHY was right and that the program must go in in spite of all.

We have a wrong Why.

MAGIC

IT WILL BE FOUND THAT WHERE YOU HAVE A REAL WHY PEOPLE WILL COOPERATE ALL OVER THE SCENE.

The only exception is where there are traitors around. But this is an easy explanation, too often bought to excuse wrong Whys.

The Germans, when they found in World War II how ineffective the Italian intelligence service was, couldn't believe it, tried to improve it, became convinced they were traitors, probably shot them in scores and took the service over themselves. And lost Italy even more rapidly. Whatever the right Why was, the Germans had the wrong one. And so does any executive who has to shoot everybody—he just can't find the right Whys.

It is NO disgrace to find a wrong Why. It is only a disgrace not to keep trying on and on until one *does* find it. Then the clouds open, the sun shines, the birds pour out their souls in purest melody and the ideal scene is approached or reached.

So REVIEW is damnably important.

Situations have to be handled very fast.

And reviews have to be as quick as possible after effect can occur.

WHOLE VIEW

So here you have the whole view.

The keynotes are OBSERVE, EVALUATE, PROGRAM, SUPERVISE and REVIEW.

The heart of observe is accuracy.

The heart of evaluate is a cool cold knowledge of the Data Series.

The heart of program is knowing the scene.

The heart of supervise is getting it FULLY done.

The heart of review is HUMILITY.

SUMMARY

If you cannot roll all this off rapidly then misunderstood words in this series are in the way. Or one is battling with some outpoint in his own life.

The Data Series is for USE.

It works because it has unlocked logic.

In management one is very fortunate since he can program and handle.

In intelligence one is less fortunate as his handling can only be suggested and many an intelligence officer has watched a useless Battle of the Bulge after he told them all about it and "they" had other ideas. But the Data Series works in intelligence as well.

Data analysis was not developed in a professorial out of a lost-to-the-world tower. It was evolved by attempting to explain logic, then was developed on one of the hottest crossfire but successful evaluation posts on the planet against a background of blood, sweat and tears war intelligence experience.

So it is itself REAL.

The key to it is handling DATA.

So here it is.

I do sincerely hope it serves you in helping to attain your ideal scene.

HCO POLICY LETTER OF 29 FEBRUARY 1972RA
ISSUE II
REVISED 3 NOVEMBER 1990

REMIMEO

DATA SERIES 24

HANDLING POLICY, PLANS, PROGRAMS, PROJECTS AND ORDERS DEFINED

The words "policy," "plans," "programs," "projects" and "orders" are often used interchangeably one for the other, incorrectly.

To handle any confusions on the words and substance of "policy," "plans," "programs," "projects" and "orders" the following DESCRIPTIVE DEFINITIONS (see Scn Logic 5) are laid down for our use.

POLICY: By this is meant long-range truths or facts which are not subject to change expressed as operational rules or guides.

PLANS: Short-range broad intentions as to the contemplated actions envisaged for the handling of a broad area to remedy it or expand it or to obstruct or impede an opposition to expansion. A plan is usually based on observation of potentials (or resources) and expresses a bright idea of how to use them. It *always* proceeds from a REAL WHY if it is to be successful.

PROGRAM: A series of steps in sequence to carry out a plan. One usually sees a *program* following the discovery of a Why. But in actual fact a plan had to exist in the person's mind, whether written or not, before a program could be written. A program, thus, carries out the plan conceived to handle a found WHY. A plan and its program require authorization (or okay) from the central or coordinating authority of the general activities of a group before they can be invested in, activated or executed.

PROJECTS: The sequence of steps written to carry out ONE step of a program. Project orders often have to be written to execute a program step. These should be written but usually do not require any approval and often are not generally issued but go to the person or persons who will accomplish that step of a program. Under the category of PROJECT would come orders, work projects, etc. These are a series of GUIDING STEPS which if followed will result in a full and successful accomplishment of the program target.

ORDERS: The verbal or written direction from a lower or designated authority to carry out a program step or apply the general policy.

In short:

POLICY = the rules of the game, the facts of life, the discovered truths and the invariable procedures.

PLAN = the general bright idea one has to remedy the WHY found and get things up to the ideal scene or improve even that. (Approval)

PROGRAM = the sequence of *major* actions needed to do the plan. (Approval)

PROJECT = the sequence of steps necessary to carry out one step in a program. (No approval)

ORDERS = some program steps are so simple that they are themselves an order or an order can simply be a roughly written project.

Thus, by these definitions a data analysis would look like this:

POLICY: (What brings the evaluation into existence in the first place.)

SITUATION: (Departure from or improvement of the ideal scene expressed in policy.)

DATA: (Observations leading to INVESTIGATION.)

STATISTICS: (The independent continuing survey of production or lack of it.)

WHY: (The real reason found by the investigation.)

ETHICS WHY: (The ethics reason found below a Why.)

IDEAL SCENE: (The state of affairs envisioned by policy or the improvement of even that.)

HANDLING:

A PLAN whether written in full or not based on the WHYs to use the resources available to move the existing scene toward the ideal scene.

A PROGRAM: A sequence of broad steps to get the plan executed.

PROJECTS: Any sequence of steps ordered or written to get a program step completed.

ORDERS: The program step itself or the verbal or written project to get the program step fully *done*.

Thus a handling could look like this:

HANDLING:

Plan: To use Bob Bartlett to replace the incompetent exec found in the WHY.

1. Find a replacement for Bartlett. PERSONNEL _____

2. Program Bob Bartlett to get his incomplete cycles caught up.
DIR OF PERSONNEL ENHANCEMENT _____

3. Train Bob Bartlett. DIR OF TRAINING _____

4. Write garrison mission orders for Bartlett.
ACTION MISSION WRITER _____

5. Write recall orders for G. Zonk (the incompetent found in the Why).
PERSONNEL _____

6. Send Bartlett to relieve Zonk. ACTION _____

7. On Zonk's return assign to bilge cleaner. PERSONNEL _____

This of course is a very simple plan and simple program.

The orders are seen as "PERSONNEL," "DIR OF PERSONNEL ENHANCEMENT," "ACTION MISSION WRITER," etc., at the paragraph ends. The program step itself is an ORDER to the person or unit named at program step end. But IT ALSO AUTHORIZES THAT PERSON OR UNIT TO DO THE STEP OR ISSUE ORDERS TO DO THE STEP OR EVEN WRITE A PROJECT AND GET IT DONE.

That final end word on the program step is an AUTHORITY as well as being an order to the person or unit named.

ROUNDUP

A copy of a full program marked MASTER is placed in a folder. The folder is marked on the edge with the program name and number. The program itself is stapled along its left edge to the inside left cover of the folder.

An "LRH Comm" is responsible for "LRH programs." A "Flag Rep" is responsible for compliance to the org's evaluation. The Executive Director's/Commanding Officer's Programs Ops is responsible for an ED's or CO's programs.

The responsibility lies in seeing that *each* step is FULLY effectively DONE.

All related papers, copies of projects, orders, etc., are collected in that folder and as each done is reported and investigated as DONE it is marked off on the MASTER program sheet.

When *all* those projects or orders bred by the program steps are DONE then the PROGRAM is considered DONE.

One does not "report progress" but only DONES and when something is NOT done yet it is chased up by the "LRH Comm," "Flag Rep" or "ED/CO's Programs Ops" and "debugged."

DEBUGGING

The word "bugged" is slang for snarled up or halted.

DEBUG is to get the snarls or stops out of it.

This itself requires an evaluation. The evaluation may be done at a glance or it may take a full formal evaluation by form.

The ideal scene here is the program step DONE or even improved.

So the WHY here would be the REAL reason it was not being done or couldn't be done and that may require *hours* to locate and sometimes days to remedy.

When "debugging" one usually finds the persons assigned the target already have a "WHY" and it is usually a false Why for if it was the right one the program step *would* get done.

Thus debugging usually begins with finding "their Whys" — which is to say reasons, excuses, apologies, etc. Getting these into view is a main part of the program step evaluation.

A project, often written, comes out of this DEBUG EVALUATION.

In extreme cases it will be found that the whole program is based on a wrong WHY and rapidly needs redoing by the original authority. Example: The WHY found was that the JINX OFFICE WAS NOT MAKING MONEY. In doing one step of the program: "3. Survey past invoices to find where money is coming from and why they don't get it now. MISSION." The mission sent finds Jinx Office was making money by the ton but it was being wasted by their having bought a huge building whose rent is three times normal rental "in the hopes new subtenants would pay the rent but nobody wants the place." Rapid debug is needed because the target can't really be done. They ARE making money and they *do* get it now.

In such a case doing the program unearthed a new REAL WHY and scrubbed that program.

A superfrantic hysterical communication would be sent to the authority of the program "New WHY found by Pgm 891 target 3 observation. Jinx Office paying $80,000 a quarter for skyscraper. Obvious real Why ED has delusions of grandeur, is a bad business head. Suggest Pgm 891 redone on new Why and suggest plan of mission here for instant offload of this skyscraper and office into proper quarters and replacement of ED." At which the "LRH Comm," "Flag Rep" or "ED/CO's Programs Ops" will approach the authority for the program to get immediate cancellation of 891 and all program targets and a new Program 891R based on the REAL REAL WHY.

Debug, however, is not always so dramatic: "We don't have anyone to put on it" is the usual excuse as they sit lazily chatting amongst their piled up dev-t.

So one evaluates the area against the program target and finds a WHY that, executed as a *project* will get that target done.

The PERFECT DEBUG EVALUATION (a) gets the target done, (b) improves the area, (c) leaves no dregs of human emotion and reaction behind it.

Just plain screaming often works. But if one has to, there is a real WHY there someplace that should be found, a project handed out and done.

You can find out all the SITUATIONS and WHYS in the world but if there isn't a PLAN and PROGRAM and if these are not DONE fully, then nothing beneficial will happen. Indeed the not-dones, half-dones and backlogs will mount up (per HCO PL 26 Jan. 72, AKH Series 29, Exec Series 5, NOT–DONES, HALF–DONES AND BACKLOGS) and set the whole thing a step backwards.

Bad programs and clumsy projects develop useless traffic (dev-t) and tie people up all over the place, pull them off normal needful actions and send the existing scene even further from the ideal scene. They make people very busy but nothing beneficial is gained and as the useless actions distract from normal duties, the whole place is at risk.

Staffs subjected to programs that are not based on sound observation, evaluation, a REAL WHY and the points in Data Series 23, become apathetic as they see no result.

So programs that are bad and programs that are right but don't get fully done are alike deadly. THERE IS NO SUBSTITUTE FOR CORRECTLY DONE DATA ANALYSIS.

THERE IS NO EXCUSE FOR NOT GETTING CORRECT PROGRAMS DONE.

In this way and only in this way can one raise the existing scene toward an ideal scene.

Data analysis is a powerful tool. YOU CAN USE IT.

HCO POLICY LETTER OF 19 MARCH 1972
ISSUE II

REMIMEO

DATA SERIES 25

LEARNING TO USE DATA ANALYSIS

After one has studied data analysis, he is expected to be able to use its principles easily and swiftly.

The barriers to being able to use data analysis are, in the order of frequency:

1. Misunderstood words. One has not gotten the definitions of the words used. This does not mean "new words." It is usually old common words. It is not just long words, it is more usually little ones. To handle this, one takes each policy letter (or chapter) in turn and looks it over carefully to see what words he cannot rapidly define. To help in this, one uses an E-Meter and "Method 4" Word Clearing which is the method of using a meter to see if "Are there any words in this policy misunderstood?" Any upset or antagonism or boredom felt comes only from a misunderstood word or misunderstood words.

2. The person has himself an outpoint in his routine thinking. This is found and handled by what is called an "HC (Hubbard Consultant) List." This list assessed on a meter detects and handles this.

3. Lack of knowledge of an existing or an ideal scene. This is handled by observing the existing scene directly or indirectly by reports and, for the ideal, study of the basic policy of the scene which gives one its ideal, its expected products and form of organization.

4. Not having studied the Data Series. Handled by studying it properly.

5. Not having studied data analysis from the viewpoint of needing to apply it.

6. Thinking one already knows all about analyzing and data. Handled by looking over some past failures and realizing they could have been prevented by a proper collection of data and analyzing it.

7. Tossing off "reasons" personally on one's own personal area which are usually just excuses or justifications and not Whys. "I was too tired," "I should have been tougher," "They were just bums anyway," which loads up one's own life with wrong Whys. Handled by being more alert to and more honest about the causes and motives of one's life and the scene, and doing a better analysis.

8. Confusing errors with outpoints. Handled by practice.

9. Confusing outpoints with Whys. Handled by learning to observe and better study of data analysis.

10. Too narrow a situation. Handled by getting more data and observing the scene more broadly.

11. Missing "omitted data" or particles or people as a frequent outpoint. Handled by knowing the ideal scene better. What *should* be there and isn't.

THE BEGINNER

When one begins to apply data analysis, he is often still trying to grasp the data about data analysis rather than the outpoints in the data. Just become more familiar with the Data Series.

Further one may not realize the ease with which one can acquire the knowledge of an ideal scene. An outpoint is simply an illogical departure from the ideal scene. By comparing the existing scene with the ideal scene, one easily sees the outpoints.

To know the ideal scene, one has only to work out the correct products for it. If these aren't getting out, then there is a departure. One can then find the outpoints of the various types and then locate a WHY and in that way open the door to handling. And by handling, one is simply trying to get the scene to get out its products.

Unless one proceeds in this fashion (from product back to establishment), one can't analyze much of anything. One merely comes up with errors.

The definition and nature of products is covered in several PLs and especially in HCO PL 13 Mar. 72, Esto Series 5, PRODUCTION AND ESTABLISHMENT, ORDERS AND PRODUCTS.

An existing scene is as good as it gets out its products, not as good as it is painted or carpeted or given public relations boosts.

So for ANY scene, manufacturing or fighting a war or being a hostess at a party, there are PRODUCTS.

People who lead pointless lives are very unhappy people. Even the idler or dilettante is happy only when he has a product!

There is always a product for any scene.

The analyst when he begins may get the wrong product. He may get a doingness instead of something one can have. And he may look upon a half-completion or half-done thing as a completed product.

All this makes his data analysis faulty. As he can't figure out an ideal scene, he then has nothing to compare the existing scene to. It is simply a matter of the cost and time involved in not or half getting a product compared to the ideal scene of a really valuable product with exchange value and what it takes to get it. These two things can be worlds apart. The trail that leads to a WHY that will close the gap is plainly marked with one kind or another of outpoints. Where the most and biggest are, there is the WHY. Found, the real WHY and actual handling will move the existing toward ideal.

Hideously enough, what I say about products is true. Even a government could have a product. Like "a prosperous happy country." An intelligence agency often muffs its

product, such as "a properly briefed head of state." But to do it the head of state would have to have a product concerning other nations like "friendly, cooperative allies which are a help and no threat" or some other product. Otherwise the agency would wind up going straight out of the intelligence business and being required to conduct its business by assassination of foreign notables or other actions to do handlings based on wrong Whys.

As there would be no product, there could not really be an ideal scene. If there is no ideal scene, then there is no way to compare the existing scene. Thus, outpoints would expose situations but no WHY would really be possible as there's no ideal scene to approach. One has often heard some agency or activity say, "Where the hell are we going anyway?" Translated this would be "We haven't had any ideal scene set up for us." And translated further, "The policymakers have no product in view." So they aren't going anyplace really and lack of an objective would cause them to go down and lack of a product would cause them to be miserable.

That's the way life has been running.

Parents and others often ask children, "What will you *do* when you grow up?" Or "What are you going to *be*?" This is not baffling for a 5-year-old, perhaps, but it is a confuser for a child of 12. There are *BE,* DO and HAVE as three major conditions of existence. One must BE in order to DO and DO in order to HAVE. A product is the *Have*. It is not the DO. Most people give "Do" as "product." A product is a completed thing that has exchange value within or outside the activity.

If one asked a 12-year-old, "What product are you going to make when you grow up?" he'd likely give you the exchange reward as the answer, like "money." He has omitted a step. He has to have a product to exchange for money.

To "make money" directly he'd have to be the secretary of the treasury, superintendent of the Mint or a counterfeiter!

Only if you cleared up product and exchange with him could he begin to answer the question about what's what with growing up.

Let's say this is done and he says he is set on making photographs of buildings. The DO now falls into line—he'd have to photograph things well. The BE is obvious—architectural photographer. The exchange of architectural photographs for salary or fee is feasible if he is good.

So now we find he is a poor boy and no chance of schooling or even a box camera. That's the existing scene.

The ideal scene is a successful architectural photographer making pictures of buildings.

You see the gap between the existing scene and the ideal scene.

Now you can follow back the outpoints and get a WHY.

It isn't just that he's poor. That's no WHY as it opens no doors to get from existing scene to ideal scene.

We investigate and find his "father" is very religious but an alcoholic and that the boy is illegitimate and his "father" hates his guts.

So we find a WHY that his "father," much less helping him, is not about to let him amount to anything whatever ever.

This opens a door.

Handling often requires a bright idea. And we find the local parson has often shown interest in the boy so an obvious handling is to get the parson to persuade the "father" to let the boy apprentice in the local photo store and tell the boy what he has to do to make good there.

Situations cannot be handled well unless a real WHY is found.

And a real WHY cannot be found unless *the* product is named and an ideal scene then stated. This compared to the existing scene gives us, really, the first outpoint.

In going the other direction, to find a WHY of sudden improvement, one has to locate poor existing scenes that suddenly leap up toward ideal scenes. This is done by locating a high product period (by stats or other signs of production) and comparing IT as an ideal scene to the existing scenes before it (and just after if there was a slump) and looking into that for a WHY. But one is looking for *pluspoints*. And these lead to a real WHY for the prosperity or improvement.

A "Who" will often be found. Like "James Johnny was shop foreman then." Well, he's dead. So it's not a Why as it leads nowhere. What did James Johnny DO that was different? "He got out products" leads nowhere. We keep looking and we find he had a scheduling board and really kept it up-to-date and used it as a single difference. Aha, "The WHY is a kept-up scheduling board!" The handling is to put a clerk on doing just that and hatting the current foreman to use it or catch it. Result, up go the stats and morale. People can look at it and see what they're producing today and where they're at!

So not all WHYS are found by outpoints. The good situations are traced by pluspoints.

If the high peak is current, one has to find a Why, in the same way, to maintain it.

STANDARD ACTION

A beginner can juggle around and go badly adrift if he doesn't follow the pattern:

1. Work out exactly what the (person, unit, activity) should be producing.
2. Work out the ideal scene.
3. Investigate the existing scene.
4. Follow outpoints back from ideal to existing.
5. Locate the real WHY that will move the existing toward ideal.
6. Look over existing resources.

7. Get a bright idea of how to handle.

8. Handle or recommend handling so that it stays handled.

This is a very sure-fire approach.

If one just notes errors in a scene, with no product or ideal with which to compare the existing scene, he will not be doing data analysis and situations will deteriorate badly because he is finding wrong Whys.

THINKING

One has to be able to think with outpoints. A crude way of saying this is "learn to think like an idiot." One could also add "without abandoning any ability to think like a genius."

If one can't tolerate outpoints at all or confront them, one can't *see* them.

A madman can't tolerate pluspoints and he doesn't see them either.

But there can be a lot of pluspoints around and no production. Thus one can be told how great it all is while the place edges over to the point of collapse.

An evaluator who listens to people on the scene and takes *their* WHYS runs a grave risk. If these *were* the Whys, then things would be better.

A far safer way is to talk only insofar as finding what the product is concerned and investigating.

One should observe the existing scene through data or through observers or through direct observation.

An evaluator often has to guess what the WHY might be. It is doing that which brings up the phrase "Learn to think like an idiot." The WHY will be found at the end of a trail of outpoints. Each one is an aberration when compared to the ideal scene. The biggest idiocy which then explains all the rest and which opens the door to improvement toward the ideal scene is the WHY.

One also has to learn to think like a genius with pluspoints.

Get the big peak period of production (now or in the past). Compare it to the existing scene just before.

Now find the pluspoints that were entered in. Trace these and you arrive at the WHY as the biggest pluspoint that opened the door to improvement.

But once more one considers resources available and has to get a bright idea.

So it is the same series of steps as above but with pluspoints.

VETERAN

A veteran evaluator can toss off evaluations in an hour or two, mainly based on how long it takes him to dig up data.

A big tough situation may require days and days.

Sometimes luck plays a role in it. The data that was the key to it was being sat on by someone not skilled in the subject and who had no idea of relative importances. Sometimes the datum pops up like toast from an electric toaster. Sometimes one has it all wrapped up and then suddenly a new outpoint or pluspoint appears that changes the whole view of the evaluator.

Example: A firm's blacklist has just been published in a newspaper as a scandal. Evaluator: "They do *what*?" in a voice of incredulity. "They ship their security files to Memphis in open crates? Because they are saving on postage?" Wrath could dangerously shoot a wrong somebody. The idiocy is not believable. But a new datum leads to Personnel who hired a reporter in disguise because it no longer requires or looks up references.

Example: Situation where stats soared. "They used schoolchildren to pass out literature?" That's just a point but a strange one. Turns out they also hired a cashier and had NEVER HAD ONE ON POST BEFORE! Why? Nobody to take money.

Man gets dedicated to his own pet theories very easily. A true scientist doesn't fixate on one idea. He keeps looking until he finds it, not until his pet theory is proven. That's the test of an evaluator.

STATISTICS

One always runs by statistics where these are valid.

Statistics must reflect actual desired PRODUCT. If they do not, they are not valid. If they do, they give an idea of ideal scene.

From a statistic reflecting the desired products, one can work out the departure from the ideal scene.

A backlog of product production must reflect in a stat. As a backlog is *negative* production.

From such tools an evaluator can work.

The use of data analysis is relatively easy compared to learning a musical instrument.

You have the hang of how it is done.

So why not just be a veteran right now and DO IT.

L. RON HUBBARD
FOUNDER

HUBBARD COMMUNICATIONS OFFICE
SAINT HILL MANOR, EAST GRINSTEAD, SUSSEX

HCO POLICY LETTER OF 12 JUNE 1972RA
REVISED 14 DECEMBER 2000

REMIMEO

DATA SERIES 26
ESTABLISHMENT OFFICER SERIES 18

LENGTH OF TIME TO EVALUATE

(Restored 14 Dec. 2000 to the original LRH text.)

It will be found that long times required to do an evaluation can be traced each time to AN INDIVIDUAL WHY FOR EACH EVALUATOR.

These, however, can be summarized into the following classes of Whys:

This list is assessed by a Scientology auditor on a meter. The handling directions given in each case are designations for auditing actions as done by a Scientology auditor and are given in the symbols he would use.

1. **MISUNDERSTOOD WORDS?** _____
   (Handled with Word Clearing [Method 1 and Method 4 of the Word Clearing Series].)

2. **INABILITY TO STUDY AND AN INABILITY TO LEARN THE MATERIALS?** _____
   (Handled by a Study Correction List HCOB 4 Feb. 72.*)

3. **OUTPOINTS IN OWN THINKING?** _____
   (Handled by what is called an HC [Hubbard Consultant] List, HCOB 28 Aug. 70.)

4. **PERSONAL OUT ETHICS?** _____
   (Use PL 3 May 72, by an auditor. Has two Listing and Nulling type lists.)

5. **DOING SOMETHING ELSE?** _____
   (2-way communication or PL 3 May 72 or reorganization.)

6. **IMPATIENT OR BORED WITH READING?** _____
   (Achieve superliteracy. LRH Executive Directive 178 International.)

7. **DOESN T KNOW HOW TO READ STATISTICS SO DOESN T KNOW WHERE TO BEGIN?** _____
   (Learn to read stats from Management by Stat PLs.)

*[*Editor's Note:* HCOB 4 Feb. 72 was later replaced by HCOB 4 May 81RA, Rev. 27.6.88, STUDY GREEN FORM.]

8. **DOESN T KNOW THE SCENE?** _____
(Achieve familiarity by direct observation.)

9. **READS ON AND ON AS DOESN T KNOW HOW TO HANDLE AND IS STALLING?** _____
(Get drilled on actual handling and become Super-Literate.)

10. **AFRAID TO TAKE RESPONSIBILITY FOR THE CONSEQUENCES IF WRONG?** _____
(HCOB 10 May 72 on Robotism. Apply it.)

11. **FALSELY REPORTING?** _____
(Pull all withholds and harmful acts on the subject.)

12. **ASSUMES THE WHY BEFORE STARTING?** _____
(Level IV Service Facsimile triple auditing.)

13. **FEEL STUPID ABOUT IT?** _____
(Get IQ raised by general processing.)

14. **HAS OTHER INTENTIONS?** _____
(Audit on L9S or Expanded Dianetics.)

15. **HAS OTHER REASONS NOT COVERED IN ABOVE?** _____
(Listing and Nulling to blowdown F/N item on the list.)

16. **HAS WITHHOLDS ABOUT IT?** _____
(Get them off.)

17. **HAS HAD WRONG REASONS FOUND?** _____
(C/S Series 78.)

18. **NOT INTERESTED IN SUCCESS?** _____
(PL 3 May 72, and follow as in 14 above.)

19. **SOME OTHER REASON?** _____
(Find it by 2-way comm.)

20. **NO TROUBLE IN THE FIRST PLACE?** _____
(Indicate it to person.)

When this list is assessed one can easily spot why the person is having trouble with the Data Series or applying it. When these reasons are handled, one can then get the series restudied and word cleared and restudied and it will be found that evaluations are much easier to do and much more rapidly done.

DATA SERIES 27

SUPPLEMENTARY EVALUATIONS

(Star-rate all evaluators)

If one knows how to evaluate an existing scene correctly (which means by the purest and most exacting application of the Data Series) and still does not achieve an improvement toward the ideal scene, several things may be the reason.

First amongst these is of course poor evaluation. Second would be a considerable disagreement in the evaluated scene with the Why, especially if it is interpreted as condemnatory. Third would be a failure to obtain actual compliance with the targets in the evaluation. Fourth would be interference points or areas which, although affecting the scene being evaluated, are not looked at in relationship to it.

In any scene being evaluated, there are two areas which are not likely to get much attention from the evaluator as they may not be remarked on in any of the reports or data being used in his evaluation. These two types of area are (1) LOCAL ENVIRONMENT and (2) RELAY POINTS AND LINES BETWEEN POLICY AND ORDER SOURCE AND THE SCENE ITSELF.

These two areas may be looked at as (1) the plane upon which the scene exists and (2) the upper stages of authority under which the scene reacts.

THE LOCAL ENVIRONMENT

The surrounding area to the scene being evaluated in the matter or a person would be the general third dynamic or other dynamic in which he or she lives his day-to-day life and which influences the person and therefore influences his hat or post. The search for the Why which exactly causes Joe or Joanna to fail to hold post or wear a hat and which when handled will greatly better Joe or Joanna may well be their reactions to environments at their level and which may be or may not be there with them. Family or distant friends, not visible to an evaluator, or the work environment or on-the-job friends of Joe or Joanna may greatly influence Joe or Joanna.

This might prove too inviting for the evaluator to blame environment for the state of the existing scene and a caution would have to be introduced: that any Why must lead to a bettered scene and must not just explain it.

Thus, in such a problem it should be understood that one has TWO existing scenes, one, the person and two, his environment; that they interrelate does not make them just one scene. Thus two evaluations about Joe or Joanna are possible, each with its program. To go about it otherwise is likely to prove as unsuccessful as the original evaluation of the person. Life and orders are reaching Joe or Joanna through relay points which are not ordinarily taken into consideration. Thus those areas should be separately evaluated. Usually, in the case of a person, something would have to be done to those areas, on the same plane as the person, by the person himself. So the program might include what the person himself could do about them.

The local environment of a material object, such as a machine or an office or a vehicle, may also be evaluated as well as the machine or the office or vehicle itself.

In short, there are relay points of difficulties that produce situations, on the same plane as the person or thing being evaluated. And these make ADDITIONAL evaluations possible and often profitable to the evaluator in terms of bettered ideal scenes. Yet at first glance, or using only the usual reports, it may seem that there is only one situation, such as the person himself.

Completely in the interests of justice, it is unfair to put down a target in some greater area situation like "Remove Joe." It may well be that stats did go down when Joe was appointed to a post. Well, that may be perfectly true. But by only then evaluating Joe and not the greater zone of Joe's *personal* scenes, one may very well come up with a very wrong and abrupt and unjust target. WHO in other words, when found, may not solve the scene at all even when one only targets it as "specially train" or "audit" without removal. There may be another scene that is having an effect on Joe which, if not evaluated properly with a proper program of its own, will make nonsense out of any program about Joe himself related only to his post or position. Another scene may be relaying fatality to Joe which if unhandled will unsuit him to any other post of any other kind.

Thus Joe and Joanna would have, each of them, TWO or more full evaluations possible. What the person is failing at or not doing on the job may have a plain enough Why that can be corrected by programing and moved to an ideal scene or at least toward it. What is hitting the person at an environmental or familial or social level might be an entirely different situation, requiring its own evaluation, with a proper Why and program for Joe or Joanna to carry out themselves or even with some help from others.

In a broader case, we have, let us say, an organization or division that is in a situation. One, of course, can evaluate it as itself, finding a proper Why and a nice bright idea and a program. And one can also do a second evaluation of the local environment. This might be the society or an adjacent division or even another organization. And this will require the location of a situation and finding its Why and working out a program to handle that can be done by the org or the division itself or with help from outside.

The local environment outside the scene being evaluated is then a proper subject for another evaluation.

It is a serious error to only evaluate the local environment as all too often the person or org or division will insist that that is the ONLY situation and also that it is totally beyond any remedy by their own actions. Thus, if the evaluator is going to evaluate the local environment of a subject that is in a situation, he does it AFTER he has evaluated the subject on its own ground totally.

EVALUATION OF ECHELONS

On any command or communication channel there are always a certain number of points extending from source through relay points down to the final receipt- or action-point. These may be very numerous. Some may be beyond the authority of any evaluator. But each is capable of having ITS OWN SITUATION that will cause an evaluation of the receipt- or action-point to fail.

These can be called “echelons” or step-like formations. The receipt- or action-point that is to comply finally with the program may be the subject of hidden sources of effect in the relay points of any program or order.

Thus, as in the case of a dangerous decline of some activity somewhere, an evaluator has several evaluations possible and probably necessary.

It would be, by experience, a severe error to try to evaluate all these different scenes (such as many echelons each in a different area) in one evaluation and find a Why for the lot as one is attempting to find a single Why for several different scenes in different places which violates the strict purity of evaluation procedure.

One may find the exact and correct Why for the point of action and do a splendid program only to find that somehow it didn’t come off or didn’t last. Yet it was the right Why for that scene. Hidden from view is the influence on that scene from one or more upper echelons which have, themselves, an individual situation and need their own Why and their own program. Only then can the influence on the action-point be beneficial in its entirety.

There is a system by which this is done.

1. One recognizes that there is a situation in an area which has not responded well to previous evaluation or has not maintained any benefit received very long.

2. One realizes that there are several echelons above the point being evaluated.

3. One draws these points without omission. This makes a sort of graph or command chart. It includes every command or comm relay point above the level of the point being evaluated.

4. The points, if any, BELOW the point under consideration as in (1) above are then added to the chart below it.

5. One now undertakes a brief study of EACH of these points above and below to see if any have a situation of its own that could influence the success or failure of the original point evaluated as in (1) above.

6. One does a full separate evaluation of each of these echelon points where any situation seems to exist. Each of the evaluations done must have its own local

AGAIN
EXIT
CONTENTS
ORG BOARDS
INDEX

situation, Why and program. Care is taken not to evaluate "no situations." Care is also taken to keep this SERIES of evaluations consistent with the main idea of remedying (1) above.

7. The evaluations are released as a series and executed as feasible.

In doing such a series, brand-new data may leap out as to the interrelationship of all these relay points and this may bring about a recommendation for a change of organization requiring new policy. But this would be another evaluation entirely as it is in effect an evaluation of basic organizational policy and may even require that tech be issued or withdrawn.

Take a case where the area which has not bettered or sustained a betterment has in actual fact two echelons below it and six above. The area, let us say, is a continental management office of an international hotel chain. Below it are its state offices and below that the hotels on that continent. Above it is the international comm relay center, the international headquarters executive at international headquarters for that continent, above that the international management organization, above that the chief executive of the international management organization, above that the advisers to the board and above that the board itself.

By drawing these out as a series of echelons one sees that there is potentially a series of eight evaluations in addition to the main evaluation of that continental office which is where the situation originally was. By scanning over all these eight other influencing areas, one may find one or more of them which have situations of real influence on the original evaluation subject.

One then evaluates separately and handles separately WHILE STILL GOING ON HANDLING THE ORIGINAL SUBJECT.

One can then also do the local environment evaluation of the original subject if there seems to be a situation there.

No evaluation is done where there is no situation. But one should assert in a covering note to the series that there are no known situations in the remaining points.

Doing a series of evaluations and local environment evaluations can be extremely fruitful only so long as one realizes that they comprise separate situations which only by their influence are preventing an ideal scene from being achieved in the original area where betterment cannot be attained or maintained.

Supplementary evaluations, when necessary and when done, can rescue a long series of apparently fruitless evaluations of a subject and move the evaluator himself toward a more ideal and happier scene of success.

DATA SERIES 28

CHECKING EVALS

(The previous version of Data Series 28 is cancelled because it could be misinterpreted and I did not authorize its release. The data contained in it would have been written by me as a policy letter had I considered them vital to evaluation.)

In checking over the evaluations of others, there is no substitute for following the hard and fast rule of insisting upon:

a. Purity of evaluation,

b. Consistency,

c. Workability,

d. Authenticity of the data.

There are no small rules. To quote one of these, "The Situation is the direct opposite of the Ideal Scene." This is not necessarily true and is not a precise definition. A Situation is the most major departure from the Ideal Scene. That's purity by definition.

A Why is not necessarily opposite to an ideal scene. But it is of the same order of thing.

Example: Stat of income divided by staff sunk to 15 cents.

Ideal Scene: Staff producing under competent management.

Sit: Execs not coming to work.

Why: The ED has forbidden any exec to be paid.

If you look this over it is consistent. But it is not reversals or opposites.

The stat found the area, the Ideal Scene was easy. Search of data found the Sit as the biggest departure. Further search found the Why. Further search and knowledge of the existing scene would get a bright idea (which would *not* be sacking the ED who is probably the only one coming to work, but more likely getting the ED and execs into a Hello-Okay session and resolve their hates and ordering execs be paid at once).

THE COMMON BUG

(Orders of Day item 24 Feb. 75)

"I found that getting the sit was a common bug. Evidently people don't do a real stat analysis and get an Ideal Scene, look for its furthest departure and get the Sit and then look for data and find the Why.

"There are many ways to go about it but the above is easy, simple and foolproof.

"It would look like this on a worksheet:

"GDS analysis to find the area and a conditional guess.

"Ideal Scene for that area.

"Biggest depart from it for the SITUATION.

"Stats
Data
Outpoint Counts
Why
Ethics Why
Who
Ideal Scene
Handling
Bright Idea

"If you're very good your GDS analysis will get confirmed by data.

"The real Why opens the door to handling.

"And you can handle.

"This doesn't change eval form. It's just a working model.

"All good evals are *very* consistent — all on same railroad track. Not pies, sea lions, spaceships. But pies, apples, flour, sugar, stoves.

"I think evaluators get dispersed and Q-and-A with data, lacking any guideline. And so take a near forever.

"Last one I did, the GDS analysis gave the whole scene and then it got confirmed, all on the same outline as above. That org is still booming!

"It took 6½ hours, *including* doing the majority of the targets!

"It doesn't take days or weeks, much less months!

"It takes hours."

DATA SERIES 28-1

CHECKING EVALUATIONS, ADDITION

(This policy letter was compiled from a series of notes written by LRH in reviewing evaluations in 1976. It is being issued for use by evaluators and personnel who critique evaluations. — CSI)

MULTIPLE SITUATIONS

Evaluators can be on a "whole org" kick where the evaluation must handle the whole org. Evidence of this is the Why lately was defined (by someone else) as something that handled all outpoints. The initial step of the stat analysis to find the area and then find its situation and its Why is not being done. Hence, individual org situations do not get spotted or evaluated and evaluations take forever.

A situation is something that affects stats or survival of the org. An outpoint is something that contributes to a situation and should not be in the situation area. A Why is the real basic reason for the situation which, being found, opens the door to handling. Evaluators who are trying to embrace the whole org or world in one evaluation are missing all the real situations or landing only in Division 7.

An evaluation can have "philosophical Whys," such as: "The CO and HCO have prevented execs from being made by omitting actions that would accomplish this (i.e., choosing suitable ones, hatting, training and apprenticing them) which has led to blows and the nineteenth-century solution of transfers and removals and eventually no execs at all." That's all fine but you can ask of it, "How come they're doing that?" so it couldn't be a bottom-level Why. Anytime you can ask a "How come?" you haven't got a Why, you have a situation.

Just an off-the-cuff Why better than that would be, "Day and Foundation staff are the same, allowing no time to hat and train" or another, "There is no HCO staff" or another, "Only a handful make the GI and the rest of the org is considered superfluous" — yet none of these are the Why either as you can also again ask "How come?"

The new type of evaluation would use telex lines and FRs to ask a lot of questions AFTER one had found the real situation. It would go: Find the situation area from stats, find the situation from data files, get some sort of a Why (that will now become the situation) and burn the telex lines or send a mission from the FOLO to find out how come that situation. You would then get the real Why and could do a program. This would make evaluations pretty real!

ADDITION OF 2 OCTOBER 1977

REMIMEO

DATA SERIES 28-2

MULTIPLE SIT EVAL FORMAT

For multiple situation evaluations, the following is the correct format to use in the final evaluation write-up:

SITUATION ONE

POLICY:

SITUATION:

STATS:

DATA:

OUTPOINT COUNT:

PLUSPOINT COUNT: (As applicable)

WHY:

ETHICS WHY: (As applicable)

WHO: (As applicable)

IDEAL SCENE:

HANDLING: (For a multiple sit eval, the plan is written here, e.g. — "*HANDLING:* Find and train executives . . ." etc.)

SITUATION TWO

POLICY:

(And so on, as per above)

The above format is repeated for as many situations as were evaluated.

Then:

PROGRAM

1. (First target)
2. (Second target)

And so on.

The program targets to specifically handle the Whys of each situation should be divided up as follows:

SITUATION ONE TARGETS

4. (Or whatever number, in sequence, after any beginning general targets) Make up a list . . .
5. Go through the org . . .
6. Go and see . . .

(Etc.)

SITUATION TWO TARGETS

19. (Or whatever number, in sequence, following the Sit One targets) See that . . .
20. Call on . . .
21. Get the . . .

(Etc.)

One does this for as many situations as were evaluated.

When writing and issuing a set of program orders or mission orders separate to the eval itself, the usual program or mission order format is used, except the operating targets get divided up as shown above.

DATA SERIES 29

OUTPOINTS, MORE

I recently surveyed a number of possible new outpoints. Almost all of them were simply the basic outpoints in a different guise and needed no special category.

However, two new outpoints did emerge that are in addition to the basic number.

The new outpoints are:

ADDED TIME. In this outpoint we have the reverse of dropped time. In added time we have, as the most common example, something taking longer than it possibly could. To this degree it is a version of conflicting data = something takes three weeks to do but it is reported as taking six months. But added time must be called to attention as an outpoint in its own right for there is a tendency to be reasonable about it and not see that it IS an outpoint in itself.

In its most severe sense, added time becomes a very serious outpoint when, for example, two or more events occur at the same moment involving, let us say, the same person who could not have experienced both. Time had to be ADDED to the physical universe for the data to be true. Like this: "I left for Saigon at midnight on April 21st, 1962, by ship from San Francisco." "I took over my duties at Saigon on April 30th, 1962." Here we have to add time to the physical universe for both events to occur as a ship would take two or three weeks to get from San Francisco to "Saigon."

Another instance, a true occurrence and better example of added time, happened when I once sent a checklist of actions it would take a month to complete to a junior executive and received compliance in full in the next return mail. The checklist was in her hands only one day! She would have had to add 29 days to the physical universe for the compliance report to be true. This is also dropped time on her part.

ADDED INAPPLICABLE DATA. Just plain added data does not necessarily constitute an outpoint. It may be someone being thorough. But when the data is in no way applicable to the scene or situation and is added it is a definite outpoint.

Example: Long, long reams of data on an eval write-up, none of which is giving any clue to the outpoints on the scene. By actual survey it was found that the person doing it did not know any Why (not having used outpoints to find it) and was just stalling.

Often added data is put there to cover up neglect of duty or mask a real situation. It certainly means the person is obscuring something.

Usually added data also contains other types of outpoints like wrong target or added time.

In using this outpoint be very sure you also understand the word *inapplicable* and see that it is only an outpoint if the data itself does not apply to the subject at hand.

There is more about another already named outpoint:

WRONG SOURCE. This is the opposite direction from *wrong target*.

An example would be a president of the United States in 1973 using the opinions and congratulations of Soviet leaders to make his point with American voters.

A more common version of this, not unknown in intelligence report grading for probability, would be a farmer in Iowa reporting a Mexican battleship on Mud Creek. The farmer would be a wrong source for accurate naval reports.

A private taking an order from a sergeant that countermands an order he had from a lieutenant would be an example of wrong source.

What is sometimes called a "hey you" "organization" is one that takes orders from anyone = a repeating outpoint of wrong source.

There are many examples of this outpoint. It must be included as a very important outpoint on its own. It produces a chaos of illogical ideas and actions when present.

PLUSPOINTS

CORRECT TIME or the expected time period is a pluspoint.

ADEQUATE DATA is a pluspoint.

APPLICABLE DATA is a pluspoint.

CORRECT SOURCE is a pluspoint.

DATA SERIES 30

SITUATION FINDING

There is an ironbound rule in handling things:

WHERE YOU FIND OUTPOINTS,
YOU WILL THERE ALSO FIND A SITUATION.

If several outpoints come to view in any scene (or even one), if you look further you will find a *situation*.

There is not any real art to finding situations *if* you can see outpoints.

The sequence is simple. (1) You see some outpoints in a scene, (2) you investigate and "pull a few strings" (meaning follow down a chain of outpoints) and (3) you will find a situation, and (4) then you can evaluate.

Statistics are leaders in pointing the way. They should be X, they are not X. That is conflicting data. Behind that you will find a situation.

If anyone has any trouble finding situations, then one of three things is true: (a) he cannot recognize outpoints when he sees them, (b) he does not have any concept of the ideal scene or want it or (c) he does not know how to pull strings, which is to say ask for or look for data.

On the positive side, to find situations one has to (A) be able to recognize outpoints, (B) has to have some idea of an ideal scene and want it, and (C) has to be able to "pull strings."

Evaluation is very much simpler when you realize that the art lies in finding situations. To then find a Why is of course only a matter of counting outpoints and recognizing what (that can be handled) is retarding the achievement of a more ideal scene.

REASONABLENESS

One often wonders why people are so "reasonable" about intolerable and illogical situations.

The answer is very simple: they cannot recognize outpoints when they see them and so try to make everything seem logical.

The ability to actually see an outpoint for what it is, in itself is an ability to attain some peace of mind. For one can realize it is what it is, an outpoint. It is not a matter for human emotion and reaction. It is a pointer toward a situation.

The moment you can see this you will be able to handle life a lot better.

The human reaction is to REACT! to an outpoint. And then get "reasonable" and adopt some explanation for it, usually untrue.

You can safely say that "being reasonable" is a symptom of being unable to recognize outpoints for what they are and use them to discover actual situations.

NATIVE THINK

It may come as a surprise or no surprise at all that the ability to evaluate as given in this Data Series is not necessarily native to a being.

In a native state a being detests illogic and rejects it. He seldom uses it for any other purposes than humor or showing up a rival in debate as a fool or using it in justice or a court of law to prove the other side wrong or guilty.

A being is dedicated to being logical and he does, usually, a wonderful job of it.

But when he encounters illogic, he often feels angry or frustrated or helpless.

He has not, so far as I know, ever used illogic as a systematic tool for thinking.

Certain obsolete efforts to describe man's thinking processes stressed "associative thought" and various other mechanisms to prove man a fully logical "animal." The moment they tried to deal with illogic, they assigned it to aberration and sought drugs, tortures or executions that would "cure it." None of them ever thought of *using* illogic as a tool of rational thinking! Thus they did not advance anyone's intelligence and conceived intelligence as unchangeable and fixed.

The only Greek school of philosophy that dealt with illogic was the Sophist school. But even they had no real idea of the illogic. They were employed by politicians to make their political acts seem *reasonable!*

Even humorists have no real idea of illogic. Reading their ideas of the theory of humor shows them to be off the mark. They don't really know what is "funny."

Laughter is rejection, actually.

And humor you will find usually deals with one or another outpoint put in such a way that the reader or audience can reject it.

The groan of most humorists is that too often their hearers go reasonable on them. PAT: "Who was that hobo I saw you with last night?" MIKE: "That wasn't no oboe, that was my fife." LISTENER (puzzled): "But maybe it was a very slender hobo."

The tendency of a being is to try to keep it reasonable, logical, rational. And that is of course a very praiseworthy impulse or all life's endeavors might unhinge.

ORG BOARDS
INDEX

The fear of being illogical is a secret fear of being crazy or insane. (Not an idle fear when psychiatry was roaming around loose.) Or at the least being thought a fool or dullard or at the very very least, unworldly and uneducated.

To evaluate and be a fine evaluator is to be able to prevent a slump toward a painful collapse. And to be able to steer the way from the nonideal present to the ideal future.

A person who feels queasy about his sanity really doesn't dare look at outpoints or confront and use illogic. Yet it *is* the way to full sanity itself.

The ability to evaluate puts one at cause over both the mad and ideal. It places a being at a height it is unlikely he has ever before enjoyed in the realm of commanding the situations of life.

Evaluation is a new way to think.

It is very worthwhile to acquire such an ability as it is doubtful if it ever before has been achieved.

HCO POLICY LETTER OF 25 NOVEMBER 1973

REMIMEO

DATA SERIES 31

FINAL TARGETS

The first, foremost and most usual reason evaluations fail is because the programs to handle are not done.

The evaluator, with all the study for an ideal scene, the exhaustive search for data and the collection and count of outpoints and pluspoints, with the discovery thereafter of the right Why and the brightest of ideas to handle may yet be totally defeated by the simple fact that no one ever chases up the target execution and gets the program really and honestly DONE.

He can even have someone who is responsible for getting his program executed only to find they are themselves issuing additional or even contrary orders. Or even issuing whole new programs which have no relation to evaluation at all.

Circumstances have been found where a person with the duty of getting targets done was so deficient in the ability to confront that he accepted any excuse at all and was even pushed over into other subjects. The remedy for this of course is HCOB 21 Nov. 73, THE CURE OF Q&A, MAN'S DEADLIEST DISEASE.

It can be so bad that persons entrusted with target execution *did not even speak to or approach any person who had a target to do* while not reporting at all or reporting marvelous progress with the program!

So, sad to have to relate, it is not enough to be a fantastic and able evaluator. If the program is never truly done, the evaluation is merely a mental exercise.

The ability to supervise and obtain cooperation and execution is mandatory for the skill of any evaluator.

HCO PL 1 Sept. 73, ADMIN KNOW–HOW No. 30 and HCO PL 15 Oct. 73, AKH Series 31, Esto Series 29, ADMINISTRATIVE SKILL, give the evaluator some of the additional data he needs to obtain execution of his programs.

One can say right here that the thought, "Oh well, I'm just a sort of technician here and it's really not up to me to RUN things. I just evaluate and it's up to 'them' to see that they carry it out," is very likely to occur.

But if one's repute as an evaluator is to be established, it will come about because:

THE EXISTING SCENE MOVED UP MARKEDLY TOWARD OR BECAME THE IDEAL SCENE.

If that does not occur, then seniors or workers don't blame the supervisors or communicators. They blame the evaluator. "Oh him! He evaluated the building situation and look, the whole situation went to hell."

No justice at all. The data and Why and all the rest were quite right. The on-paper evaluation was perfect. It would have "handled the hell" out of it. But lamentably the program just was never done. Altered or falsely reported or untouched, the targets just weren't done.

So the test of an evaluation is:

DID IT MOVE THE EXISTING SCENE TOWARD OR ATTAIN THE IDEAL SCENE?

And *that* cannot occur without the program being fully and totally and correctly *done*.

See also HCO PL 26 Jan. 72, AKH Series 29, Exec Series 5, NOT–DONES, HALF–DONES AND BACKLOGS, for more data on this.

Thus it is VITAL that four final targets exist on *every* evaluation.

These are:

_____ (Fourth from last number of the evaluation program) Verify from personal inspection of the existing evidence or the scene itself that every target has been fully done without omission, alteration, falsehood or exaggerated reports.

EVALUATOR _____

_____ (Third from last number of the evaluation program) Look at current statistics and the results of the above inspection and the SITUATION of this evaluation as written above AND SEE IF THE SITUATION IS NO LONGER A THREAT.

EVALUATOR _____

_____ (Second from last number of the evaluation program) Look again at the IDEAL SCENE as written above. Then look at the above two targets and further investigate and SEE IF THE IDEAL SCENE HAS NOW BEEN APPROACHED MORE CLOSELY OR ATTAINED.

EVALUATOR _____

_____ (Last numbered target of the evaluation program) (A) If the above three targets do not show a favorable approach toward or attainment of the IDEAL SCENE, gather new data, investigate further and REEVALUATE, or (B) If the IDEAL SCENE has been more closely approached or attained, the following commendations or awards are assigned:

_____

_____

_____

_____

EVALUATOR _____

This signifies the conclusion of the evaluation.

(Note: The last four targets may be made available on a mimeograph sheet for the use of an evaluator in ending off his evaluation.)

By using this program ending, it is abundantly clear to all those concerned with the evaluation including the evaluator that:

THE PROGRAM AND ITS SUCCESSFUL EXECUTION ARE AN INTEGRAL PART OF AN EVALUATION.

Unless the program is fully, truthfully and successfully done, an evaluation alone cannot remedy any situation and the ideal scene will not be attained.

The reason for and the final objective of any evaluation is the approach toward or attainment of the IDEAL SCENE.

DATA SERIES 31 ADDITION

FINAL TARGET ATTACHMENT

To save the evaluator writing the final targets longhand this sheet is provided. It can be filled in with the proper numbers and data, inapplicable lines crossed out and this sheet stapled to the end of any eval.

_____ (Fourth from last number of the evaluation program) Verify from personal inspection of the existing evidence or the scene itself that every target has been fully done without omission, alteration, falsehood or exaggerated reports.

EVALUATOR _____

_____ (Third from last number of the evaluation program) Look at current statistics and the results of the above inspection and the SITUATION of this evaluation as written above AND SEE IF THE SITUATION IS NO LONGER A THREAT.

EVALUATOR _____

_____ (Second from last number of the evaluation program) Look again at the IDEAL SCENE as written above. Then look at the above two targets and further investigate and SEE IF THE IDEAL SCENE HAS NOW BEEN APPROACHED MORE CLOSELY OR ATTAINED.

EVALUATOR _____

_____ (Last numbered target of the evaluation program) (A) If the above three targets do not show a favorable approach toward or attainment of the IDEAL SCENE, gather new data, investigate further and REEVALUATE, or (B) If the IDEAL SCENE has been more closely approached or attained, the following commendations or awards are assigned:

_____

DATA SERIES 32

TARGET TROUBLES

TARGETS JUNIOR TO POLICY

A target given on an evaluation may not set aside management policy or technical releases.

Where such a target is written or misused to supplant policy, a great deal of trouble can follow.

Example: Org policy in authorized issues states that accounts for the week must be finalized at 2:00 P.M. Thursday. Someone writes an evaluation and puts a target in it to end the week on Sunday. People doing the target actions change to Sunday. This is out of phase with all other actions and chaos results.

People tend to take orders from anyone and anything in a poorly organized area.

When they use evaluation or project targets instead of policy, the whole structure may begin to cave in.

NO EVAL TARGET IS SENIOR TO OFFICIAL ISSUES AND WHERE THESE CONFLICT THE TARGET HAS THE JUNIOR POSITION.

The only way a target can change policy is to propose that such and such a policy be officially reviewed on proper channels or that a new policy be written and passed upon properly by those in actual authority.

Someone attempting to do a target who finds that it conflicts with policy or official technical releases and yet goes on and does the target is of course actionable.

TARGETS OUT OF CONTEXT

CONTEXT: The interrelated conditions in which something exists or occurs.

OUT OF CONTEXT: Something written or done without relation to the principal meaning of a work.

Targets must be written within the meaning of the whole evaluation.

Example: The evaluation is about pie. There is a target that says to polish shoes just because the evaluator happened to think of it and squeezed it into the program. A

program written to increase pies winds up with the ideal scene of polished shoes. No pies get increased so the evaluation fails.

Targets must be DONE within the *context* of the evaluation.

Example: An evaluation is done to increase central office collections. It calls for another evaluation to be done on a statistic. The person doing that target reduces the number of items collected upon and crashes central office collections.

The person DID NOT READ OR UNDERSTAND THE WHOLE EVALUATION before he did the target and so did it in a way that accidentally defeats the ideal scene.

Example: An evaluation is done to fill up a big hotel of 450 guest capacity. One of its targets calls for project orders sending a team to the hotel. The person who writes the project orders does not look at the evaluation or the hotel plans and specifies 30 guests must be gotten! The evaluation is defeated.

FALSELY EVALUATING

A person who evaluates a situation without chasing up all the data or even looking at the data in his files can bring about a false evaluation.

Example: A person has come back into an organization at a high level. The place crashes. The evaluator does not examine personnel changes at the time of the crash and comes up with "too many football games" as his Why and the evaluation fails.

FALSE DONES

False reports that a target has been done when it has not been touched or has been half-done at best is actionable in that he is defeating not only the evaluation but the organization.

Example: The evaluator has an ideal scene of repaired machines that will increase production. The mechanic reports all machines repaired now when he has not even touched them. The evaluator sees production remains low, looks around for a new Why. But his Why is falsely reported dones on his accurate eval!

PERSONAL CONTACT

Targets seldom get done without personal contact.

Evaluations should carry the name or post of the person who is overall responsible for the completion of the program.

Sitting at a desk while one is trying to get people to do targets has yet to accomplish very much. One can have messengers or communicators or Flag Representatives getting the targets done but these in turn must depend upon personal contact.

A person assigned responsibility for getting a whole program done is not likely to accomplish much without personal contact being made.

NAVIGATE
FIRST PAGE
SEARCH
FIND
AGAIN
EXIT
CONTENTS
ORG BOARDS
INDEX

This can be done on a via. Mr. A in location A remote from Mr. C in location C can get a target done reliably only if he has a Mr. B in that area whose sole duty it is to personally contact Mr. C and have Mr. C get on with it despite all reasons why not. That is how targets get done. That is also how they can be reviewed.

Target troubles are many unless the program is under direct contact supervision. Even then targets get "bugged" (stalled). But the evaluator can find out why if personal contact is made and the target can be pushed through.

SUCCESS

Therefore, the success of an evaluation in attaining an ideal scene depends in no small measure on:

1. Both evaluator and target executor realizing policy and technical materials are senior to targets in programs and that targets do not set senior policy aside. One of the best ways to prevent this is to know and refer to policy and technical issues in targets.

2. Targets must be written in context with the evaluation and done in context with the ideal scene. The best way to achieve this in writing an eval's targets is to make them consistent with the Why and ideal scene. The best way to be sure that targets will be DONE in context is to require that anyone doing a target must first read the whole evaluation (and be word cleared on it) before he does his target so that he does his target in a way to improve the existing scene in the eval not some other scene.

3. To prevent false evaluation, one may require that the evaluator attests that all pertinent data and statistics have been examined and to discipline such failures whenever an evaluation fails.

4. To prevent false dones, one must review the evidence of dones and statistics after the program is complete and discipline all falsely reporting persons and reassign the targets or in any way possible get them actually done.

5. The way to get a whole program done, target by target, is through personal contact. Supervise it by personal contact with those assigned the targets. Or use a communicator or messenger. Where the people doing the targets are remote from the evaluator, one must have someone there to do the personal contact. And be sure THAT person isn't just sitting at a desk but is actually doing personal contact on targets. Thus all evaluations, on the issue itself or by organizational pattern, should have someone who can personally contact people getting the targets done fully and completely.

If these points about evaluations and their programs are understood, one can and only then can move things toward the ideal scene.

REVISED 29 JANUARY 1979

REMIMEO

DATA SERIES 33

EVALUATION, CRITICISM OF

There are six duties of a person who is responsible for passing evaluations:

1. to see that the evaluation is correct and that it can accomplish or approach the ideal scene;

2. that those doing evaluations, by the process of the criticism itself, become trained and better evaluators;

3. that persons doing evaluations become correctly and well trained by the process of training, cramming and, as needed, ethics;

4. to see that evaluations *do* occur on existing situations;

5. to see that unevaluated situations do not exist and;

6. to make sure that the Data Series is used to its full potential.

When an evaluation is rejected, care must be taken that the criticism is correct and not capricious.

If one gives out-tech criticisms of evaluations, no evaluator will really ever learn evaluation. He will just become confused and desperate. The quality of evaluations will deteriorate and the Data Series potential will be defeated.

Therefore the only criteria that may be used in calling attention to outnesses in an eval, a requested rewrite or correction are:

A. Purity of form (all parts of an eval included);

B. Verification of stats;

C. Date coincidence correct and proven on graphs, using all graphs that have to do with the situation;

D. GDS analysis supporting the eval (stat management PLs apply);

E. Exactly offered data not borne out by an inspection of files;

F. No Situation;

G. Insufficiently broad Situation;

H. Inconsistent — Policy — Situation — Stats — Data — Why — Ideal Scene — Handling — Targets, not on same subject. The inconsistency must be precisely pointed out;

I. Outpoints in the eval itself — such as in Bright Idea or Handling, etc. The outpoint must be precisely noted and named. This does not include outpoints in the data section which are the outpoints on which the eval is based;

J. Not all pertinent or available data applicable or needed was examined by the evaluator. The excluded data must be exactly stated as to what it is and where found. Not looking at all applicable or important data makes it a partial eval;

K. Wrong Why;

L. Weak Handling;

M. Handling does not include targets to handle directly or indirectly the more serious outnesses found in the data mentioned;

N. Absence of ethics handling on serious ethics matters found in the data mentioned or of the Ethics Why;

O. No method of implementing the evaluation or maintaining the scene and getting its targets done. Such as a broken line between evaluator and scene or omitted terminals or ethics Who(s) depended upon to do the targets;

P. Sequence of handling incorrect or omitted. A production target must come first. Errors of solid organize for many early consecutive targets without production in them, no organizing at all are flunks;

Q. Vague generalities in postings which do not name the new person or the person to replace the person being moved up;

R. Musical chairs;

S. No resources or ways to get them or nonutilization of known resources or excessive use of resources for no real gain;

T. Off-policy orders or orders that set policy;

U. No target or targets to get in the policies mentioned under “Policy”;

V. Unreadable or illegible presentation of the eval for criticism or review;

W. Failure to return eval promptly with corrections;

X. Bright Idea isn't bright enough;

Y. No eval;

Z. No data trail, incorrect data trail.

If the reviewer, corrector or critic of evaluations does the above AND NOTHING ELSE he will be rewarded with better and better evaluations, less and less time spent correcting, more and more gain by use of the Data Series and a happier and more productive scene entirely.

HCO POLICY LETTER OF 18 JULY 1974

REMIMEO

DATA SERIES 34

SITUATION CORRECTION

I have just reviewed a number of attempted evaluations and was struck by the similarity of errors in them. None of these evaluations would have reached any ideal scene or even improved the existing scene.

The real reason for this is that the majority of them had a highly generalized situation such as "Bide-a-Wee Biscuit Company failing" or "Stats down from last year." They then proceeded on a data trail and got a "Why."

In these cases the Why they found was actually the situation!

Each of them had failed to use the data trail to find the situation. They were using the data trail to find a Why!

The evals then had no Why.

The handling was just a bunch of orders that were in fact unevaluated orders since no real Why had been found.

Like in playing a game these evaluators had started 50 feet back of the starting line and when they got to the starting line (the situation) they assumed it was the finish.

If you look at an "evaluation" that has a generalized "situation" like "continental products getting fewer," you will find in a lot of cases (not always accurately) that what was put down as the "Why" was in fact the situation. This left the "eval" without a Why. Thus the ideal scene would be wrong and the handling ineffective.

Example: (not in form) "Situation: Gus Restaurant failing." "Data: Customers refusing food, etc., etc." "Why: The food isn't good." "Ideal Scene: A successful Gus Restaurant." "Handling: Force Gus to serve better food, etc., etc." That isn't an eval. That is an observation that if Gus Restaurant is to survive it better get evaluated. It is being evaled because it *isn't* surviving. Now look at this: The data trail led to "the food isn't good." *That's* a situation. *Why* isn't it good enough? Well it turns out the cook got 15 percent commission from the store for buying bad food at high prices. And Gus didn't know this. So bang, we handle. Gus Restaurant achieves ideal scene of "Gus Restaurant serving magnificent chow."

In this example if you used the situation for a Why the Who would probably be Gus!

The data trail of outpoints from a highly general "situation" (that is only an observation like failing stats) will lead one to the situation and *then* a closer look (also by outpoints) will lead one to the real Why and permit fast handling.

DATA TRAIL

People can get too fixated on the history of something. They can call this a "data trail." Well, all right, if it's a trail of outpoints.

But significances of history have little to do with evaluation.

Let us say you see the machine division is failing.

Now, if you simply take masses of data about it and just start turning over 10 or 12 sheets at a time looking for outpoints only and keep a tally of what they are and to whom they belong, you will wind up with your situation area and probably your situation without reading any significances at all.

Now that you have your area and situation in it, you can start really reading all about it and get that existing scene's data and its outpoints. And your Why leaps at you.

SUBSTITUTION

You can't substitute stats for a situation or a situation for a Why.

But substitution of one part of an eval for another is a common fault.

Substituting a general hope for the ideal scene you really would and could achieve makes a sort of failed feeling in an eval. "Gus Restaurant being best in town" is nice but "Lots of customers very well fed so Gus Restaurant survives" is what you are trying to achieve. *That* can occur and will be reached if you find the real Why.

HCO POLICY LETTER OF 19 JULY 1974

REMIMEO

DATA SERIES 35

EVAL CORRECTION

An evaluation submitted for an okay is only reviewed to the first major outness (see HCO PL 3 July 74, Data Series 33, EVALUATION, CRITICISM OF) and is then returned for correction.

Only when no major correction is necessary does one then verify all data or go to an extensive review of the whole eval.

This makes the line very fast. It also saves a great deal of work by one and all.

If the Stats are incorrectly given, that's it. Reject. If the Why is really the Situation, that's it.

On the reject one gives the letter of Data Series 33 that is not correct and any reference to the Data Series that would seem helpful.

An evaluation corrector will see how well this rejection system works when you find that the eval, let us say, has no situation on it, but only some stats. Why verify anything as a whole new body of data may have to be found.

In correcting evals, if a situation is given, I usually call for the main stats of the unit being evaluated to see if these show any reason to handle it at all. I recently found an activity had had its chief removed when his stats were in Power. The activity then crashed. And *that* was the situation. It was made by an evaluator and an eval corrector not looking at the stats!

If no error exists in Situation or Stats, I read the eval down to Bright Idea and look especially at the Why, Ideal Scene and Handling to see if one would make the others.

If that's okay, I look at the targets of Handling and the Resources.

If those are okay, I look at Data and Outpoints. If these are all okay, I then verify the Data.

But if at any of these steps I find an error, I then reject at once for immediate correction.

Often, by using only basic things to reject, the whole eval has to be redone as the basics are so far wrong.

If you try to correct the whole thing before rejecting or if you correct tiny little things instead of the big ones, the whole line slows.

Eval correction should be a fast, helpful line, strictly on-policy, no opinion.

That way the job of correction becomes easier and easier.

HCO POLICY LETTER OF 11 AUGUST 1974

REMIMEO

DATA SERIES 36

ENVISIONING THE IDEAL SCENE

If one cannot envision the ideal scene, one is not likely to be able to *see* a situation or get one.

A SITUATION IS THE MOST MAJOR DEPARTURE FROM THE IDEAL SCENE.

Thus:

ONE MUST BE ABLE TO ENVISION AN IDEAL SCENE TO FIND A SITUATION.

A lot of "ideal scenes" you see are just glib. An afterthought.

Some people know the proper scene so well they at once recognize that a departure from it has occurred, which is fine. But such people do not realize, when they are teaching evaluation or correcting evals, that others may not know the proper scene well enough to get an idea of what *the* ideal scene should be. Thus, a wrong target occurs. The teacher or corrector keeps putting attention on the incorrectness of the situation given in the eval instead of noticing that the ideal scene is adrift.

An ideal scene is FUTURE.

When one is stuck on the time track it may seem pretty difficult to envision a *future.*

In politics this is called "reactionary" or "conservative." These mean any resistance to change even when it is an improvement. The bad old days seem to be the good old days to such people. Yet the old days will not come again. One has to make the new days good.

"Liberals," "socialists" and such make great propaganda out of this. They inveigh against (criticize) conservatives and say the future must be reckoned with. And they hold up some often incredible future scene and say the way to it is by "revolution" or destroying everything that was.

Both viewpoints could be severely criticized. The conservative tries to stick on the time track with no reality on the fact that today will be yesterday in 24 hours. The superliberal skips tomorrow entirely and goes up the track 5 or 10 years to a perfect state which can never exist or is falsely represented as possible.

In between these two viewpoints we have the *attainable.*

And we come to an ideal scene that *is* possible and *will* occur if the Why is right and handling is correct and done.

Envisioning an attainable future requires some connection with reality.

There is no harm at all in dreaming wonderful dreams for the future. It's almost the bread of life.

But how about giving oneself a crashing failure by disconnecting from any reality?

Some laborers do this to themselves. Taking no steps to attain it, they daydream themselves as kings or some other grand identity. Well, all right. But that isn't an "ideal scene." That's a delusion engaged upon for self-gratification in a dream world.

One cannot only dream a *possible* ideal scene but he *can* attain it.

So an ideal scene is SOMETHING THAT CAN BE ATTAINED.

It should be quite real.

Some people setting unreal quotas are really setting some impossible ideal scene. "Complete this work in 1 hour!" to someone working hard on a job that will take 4 days is delusory. It is setting, without saying so, the ideal scene of having a worker who is really a magician! Well, maybe if he were audited and hatted he would be. But that's sure some ideal scene! The here and now is a guy sweating it out and trying. And that's an ideal scene that is missed!

And so are many ideal scenes missed. The offices neat and orderly might not even be imagined by someone who has seen them in a mess for two years. He may think that's the way they're supposed to be! And be quite incapable of envisioning the offices in any other condition!

Thus, if one cannot see the offices should be clean, he does not see that they are dirty and messy as a *situation*. Thus when he is told the public won't come into the place, and even if he finds the place is full of old dirty junk, he can't evaluate it as a clean orderly place would not be envisioned by him. So he doesn't get "dirty place" as a valuable datum, doesn't get "a clean orderly place that is inviting to the public" as an ideal scene, doesn't get "office so dirty the public won't go near it" as a situation and so cannot find a Why to lack of public! And so as he didn't find *Why* it was so dirty and disorderly, it wouldn't handle. So there would be a failed eval.

Yet the teacher or evaluation corrector would not realize the person could not envision an ideal scene and so keep telling the person to find the situation whereas the ideal scene was what was out.

You can get some very beautiful ideal scenes AND attain them — if you can evaluate!

DATA SERIES 37

WHYS OPEN THE DOOR

You can really understand a real *Why* if you realize this:

A REAL WHY OPENS THE DOOR TO HANDLING.

If you write down a Why, ask this question of it: "Does this open the door to handling?"

If it does not, then it is a wrong Why.

Backtracking to find how it is wrong, one examines the ideal scene and the situation one already has.

The outpoints should be checked. The completeness of data should be checked. One may find he is in a wrong area of the scene.

Correct that, correct the ideal scene, correct the situation and look for more data.

With the outpoints of more data one can achieve the real Why that *will* open the door to handling.

Quite often an "evaluator" "knows" the Why before he begins. This is fatal. Why evaluate?

Some of the most workable Whys I've ever found surprised me! So usually I also ask, did I know this? Am I surprised? The chances are, if I "knew" it already (and the situation still exists) it is a wrong Why. And needs proper evaluation.

When you have a right Why, handling becomes simple. The more one has to beat his brains for a bright idea to handle, the more likely it is that he has a wrong Why.

So if you're not a bit surprised and if the handling doesn't leap out at you then THE WHY HAS NOT OPENED THE DOOR and is probably wrong.

I have seen evaluators take weeks to do an evaluation. In such cases they went on and on reading as they did not know how to find a real Why. Actually they did not know what one was.

By going through the *total* current files of an activity looking for outpoints just by randomly glancing at data sheets from all sources, you can find the AREA. Outpoints lead you straight to it.

An ideal scene for that smaller AREA is fairly easy to envision.

The type of outpoint will generally give you how the departure is. One can then get the situation.

By looking over (in detail now) the data of that smaller area and counting the outpoints, one can find the Why.

The Why will be how come the situation is such a departure from the ideal scene and WILL OPEN THE DOOR TO HANDLING.

If it doesn't, then review the whole thing, do the steps again. Don't just sit and sag!

Let's say we find outpoints of added inapplicable data in all reports. And they lead to Reception. The ideal scene of Reception is easy: attractive pleasant atmosphere, welcoming in the public.

We find more detailed reports that the place is full of junk and filthy and we get our situation, "Public repelled by filthy messy Reception."

Now why?

So back to the real data and we find the janitor never cleans it. Or anything else. The easy out is just sack the janitor (and leave the post empty). But that won't handle so we have no Why.

So we dig and dig and suddenly we find that the staff refer to the janitor in lowly and disrespectful terms: "Janitor has no status." Well, the outpoints all say so. And it opens the door to a handling.

So we handle by transferring the janitor org board position from Treasury where it went as he "looks after assets" to the Office of the President with the President's Secretary as his direct senior.

We write up a program for clean offices.

Magic!

The offices get clean!

The public again comes in.

The ideal scene is attained.

(You may think this example is pretty unreal. But actually it once happened and worked!)

So a right Why opens the door to handling.

If it doesn't, look harder.

THERE IS ALWAYS A REASON FOR THINGS.

And if your ideal scene and situation are correct, you can find the real Why that opens the door.

HCO POLICY LETTER OF 3 OCTOBER 1974

REMIMEO

DATA SERIES 38

PLUSPOINT LIST

The following is a list of PLUSPOINTS which are used in evaluation.

Needless to say, pluspoints are very important in evaluation as they show where LOGIC exists and where things are going right or likely to.

RELATED FACTS KNOWN. (All relevant facts known.)

EVENTS IN CORRECT SEQUENCE. (Events in actual sequence.)

TIME NOTED. (Time is properly noted.)

DATA PROVEN FACTUAL. (Data must be factual, which is to say, true and valid.)

CORRECT RELATIVE IMPORTANCE. (The important and unimportant are correctly sorted out.)

EXPECTED TIME PERIOD. (Events occurring or done in the time one would reasonably expect them to be.)

ADEQUATE DATA. (No sectors of omitted data that would influence the situation.)

APPLICABLE DATA. (The data presented or available applies to the matter in hand and not something else.)

CORRECT SOURCE. (Not wrong source.)

CORRECT TARGET. (Not going in some direction that would be wrong for the situation.)

DATA IN SAME CLASSIFICATION. (Data from two or more different classes of material not introduced as the same class.)

IDENTITIES ARE IDENTICAL. (Not similar or different.)

SIMILARITIES ARE SIMILAR. (Not identical or different.)

DIFFERENCES ARE DIFFERENT. (Not made to be identical or similar.)

The use of the word "pluspoint" in an evaluation without saying what type of pluspoint it is is a deficiency in recognizing the different pluspoints as above. It would be like saying each outpoint is simply an outpoint without saying what outpoint it was.

In doing evaluations to find why things got better so they can be repeated, it is vital to use the actual pluspoints by name as above. They can then be counted and handled as in the case of outpoints.

Pluspoints are, after all, what make things go right.

DATA SERIES 39

WHO–WHERE FINDING

You may now and then see an eval that winds up with a *Who*. Very rarely you also find one that winds up in a *Where*. Sometimes you find an "evaluator" who only finds Whos or Wheres.

If this puzzles you when you see such "evals" or if you land in that situation yourself while evaluating, remember this:

AN "EVAL" THAT ONLY HAS A WHO OR A WHERE AS ITS WHY IS *INCOMPLETE*.

What has happened is this: The "evaluator" does an outpoint count only for Who or Where. He does not then really investigate or dig up the real data on that Who or Where but lets it go at that. He says — WHY: Dept 1 not functioning. WHO: Director of Personnel. IDEAL SCENE: A functioning Dept 1. HANDLING: Shoot the Dir Personnel.

Such evals do NOT raise statistics. They do *not* work. Because they are not complete!

In *any* eval you have to do an outpoint count to find where or who to investigate. *This* prior outpoint count does not appear, always, on the eval form. It's just where to look.

Having gotten the Who or Where you NOW do a full readout, lift the rocks, pry into the cracks and find the Why.

It can even get worse. Having seen something wrong, one puts down a situation. He does a preliminary outpoint count for a Where or Who and *then* discovers a more basic or even worse situation. In other words, his situation can change!

Example: No personnel being hired leads one to Dept 1, Personnel. So one writes the situation: "No one being hired." Then one can easily dash off, "Why: Dept 1 inactive. Ideal Scene: An active Dept 1 hiring personnel." And write up a handling: "Hire people."

Great, easy as pie. *But* somehow six months later there are *still* no personnel! The reason is simple: The "evaluator" never went beyond the Who-Where. He put down a Who-Where as his Why.

Real evaluation would go this way: First observed situation, "No personnel being hired." The Who-Where comes up as Dept 1. *Now* and only now do we have

something to evaluate. So our *situation* has changed. It becomes, "Dept 1 inactive." And we investigate and lo and behold there is no one in that whole division! Again we could go off too early. It is tempting to say, "Why: No one in it!" And say, "Handling: Put somebody in it!"

But actually "no one in it" is just data! Certainly the execs who should be screaming for personnel know there is no one in Dept 1. After all, they get cobwebs on their faces every time they pass the door! So it is just an outpoint, not a Why as it does not securely lead to solution. So we look further. We find seven previous orders to put on a Director of Personnel! The writers of these orders are not the Whos but who they were given to are elected. That's seven noncompliances by the executive in charge of organizing! And this turns out to be Joe Schmoe. *Now* we have a *Who*. So what's with this Joe Schmoe? So we go to anything connected with Schmoe and we locate board of directors minutes of meetings and herein he has been stating for two years repeatedly that "The organization only makes so much money anyway so if we hire anybody to deliver service we might go broke." As the organization has been going broke for those two years and the last Dir Personnel was fired two years ago, we now also have our DATE COINCIDENCE. But this is still just an outpoint — contrary facts, as one has to deliver to stay solvent. So we look up Joe Schmoe even further and we find he is *also* the chief stockholder in a rival company! So here is our Why: "Organization being suppressed by the chief stockholder in the company's rival." "Who: Joe Schmoe. Ideal Scene: Organization hiring personnel needed to deliver." Now for the handling. Well, Joe Schmoe could mess things up further if one just fired him. So we better know what we're doing. We have found our organization controls the tin Joe Schmoe's company needs for its cans. So we shut off the tin supply and when Schmoe's stock falls we buy it up, merge the companies and fire Joe. Or so a businessman would do. THAT handles it!

Shallow evals that stop with a Who-Where on the first inspection don't succeed. Outpoints are usually aberrated and the people there around them usually handle things unless they have depth of mystery.

You have to have a Who-Where to *begin* your investigation. Once you find your Who or your area, *now* the outpoints begin to count.

Very few situations in actual fact are caused by active Whos. Usually it is inactive Whos, confronted with situations they have not grasped and don't see any way through.

A classic case was a situation that did not resolve for over a year until *very* close investigation discovered a statistic was wrongly worked out and which targeted an area in the wrong direction. One could have shot "Whos" by the dozen without ever solving it!

So when you see a Who-Where as a Why, you know one thing: The eval is incomplete.

You can cure someone doing this chronically by making him first list the outpoints that show Who-Where to look. And then make him go on with the evaluation outpoints that lead to a Why, giving *two* counts of outpoints. The light will dawn.

DATA SERIES 40

THE IDEAL ORG

(First appeared as LRH ED 102 Int,
20 May 70, referring to evaluation.)

The ideal org would be an activity where people came to achieve freedom and where they had confidence they would attain it.

It would have enough space in which to train, process and administrate without crowding.

It would be located where the public could identify and find it.

It would be busy looking, with staff in motion, not standing about.

It would be clean and attractive enough not to repel its public.

Its files and papers, baskets and lines would be in good order.

The org board would be up-to-date and where the public could see who and what was where and which the staff would use for routing and action.

A heavy outflow of letters and mailings would be pouring out.

Answers would be pouring in.

Auditors would be auditing in Div 4 HGC and Qual would be rather empty.

Supervisors would be training students interestedly and 2-way comming all slows.

The HCO Area Sec would have hats for everyone. And checked out on everyone.

There would be a pool of people in training to take over new admin and tech posts.

The staff would be well paid because they were productive.

The Public Divisions would be buzzing with effective action and new people and furnishing a torrent of new names to CF.

The pcs would be getting full Grades to ability attained for each, not eight minutes from 0 to IV, but more like thirty processes. And they would be leaving with high praises.

The students would be graduating all on fire to audit.

One could look at this ideal org and know that *this* was the place a new civilization was being established for this planet.

The thousand or more actions that made it up would dovetail smoothly one with another.

And the PR area control would be such that no one would dream of threatening it.

Such an ideal org would be built by taking what one has and step by step building and smoothing; grooving in and handling each of its functions, with each of its divisions doing more and more of its full job better and better.

The business is always there — the skill with which it is handled and the results on pcs and students is the single important line which makes it possible to build the rest.

The ideal org is the image one builds toward. It is the product of the causative actions of many. Anything which is short of an ideal org is an outpoint that can be put right. The end product is not just an ideal org but a new civilization already on its way.

DATA SERIES 41

EVALUATION: THE SITUATION

(Extracted from an LRH talk to Staff Aides on 2 Jan. 72.)

There are bad situations, good situations and no situations. A situation is something that applies to survival and if you evaluate the word "situation" against survival, you've got it. A good situation is a high level of survival; a bad situation is a threatened survival and a no situation is something that won't affect survival.

We've gone ahead of the whole show of intelligence with the Data Series.

NOTE: We are using intelligence as an example *solely* and *only* because it is the most inclusive system man has developed for collection and evaluation of data.

We have greatly extended and refined this system. Espionage and other intelligence activities and skills have no part in our application. We are using intelligence as an example of data usage systems, that is all.

You are out into an area of greater simplification and far more use. This doesn't necessarily make anyone an intelligence officer, but a general or a head of something or a general manager or an executive who does not know how to evaluate a situation will make nothing but mistakes. The mistakes of history are made by people who cannot evaluate, by which we mean "determine the situation" — which even more simplified would be "find out the situation." From this given body of data, from that indicator we can find a good situation or a bad situation or a no situation. And this is what one is trying to determine. The more skilled one becomes in doing this, the less work it is. It is a matter of skill.

To give you an idea: If you tried to play every note of a concerto separately by having to look up each note in the chord book and then strike it on the piano, you wouldn't have much of a tune, right? But the longer you did that, the more likely you were to begin to approximate some sort of something that sounds like music. But it would take a lot of practice.

Now, you can get so all-fired good at evaluation that you can take an isolated indicator and know immediately where it fits into, because you know it fits into the plan of things and because you know it is or isn't part of an ideal scene. It's better than the existing scene or it is too far from an ideal scene. You can pick up an indicator in this way — and it sometimes probably looks magical to you how I will suddenly pick

up an isolated instance and look down the line and we find a roaring hot situation at the other end of it.

Now, that is done out of an economy of data. It is done because one has not the time to investigate or read all of the data which might exist on this particular subject being investigated. So one learns to do something that looks absolutely intuitive and when you're terrifically hot at this it is called "flair."

Prediction from data is an essential part of evaluation. "This datum is an outpoint — it shouldn't be, peculiar." Now it will predict more data.

You have to be so hot that you will notice something is an outpoint — it's a wild outpoint of some kind or another — except its magnitude, *size* of datum. How important is this datum? The evaluation of importance is one of the more difficult things people do. They have a tendency to consider things a monotone importance. You have to train yourself out of that.

What do we get here then as a qualification for an evaluator? You have to know all the outpoints in sight. You have to know what outpoints are. But that's rather thinking backwards because you should *know* that something shouldn't be. And as soon as you get a "shouldn't be" you can do a prediction. And that leads you into an investigation — by viewing other data. In other words you find this terrific outpoint or these outpoints and you find out where they exist, it leads you into, very directly, the point that you should be investigating.

DEFINITION OF EVALUATION

This is as close as the dictionary comes to the definition of evaluation: "to examine and judge concerning the worth, quality, significance, amount, degree or condition of." (The *Webster's Third New International Dictionary*) Now to edit that down, it's "to examine and judge the significance and condition of."

An evaluation: "the act or result of evaluating; judgment, appraisal, rating, interpretation." And an evaluator is "one that evaluates. *An intelligence officer is supposed to be a professional evaluator.*" (The *Webster's Third New International Dictionary*)

This word is a technical word which isn't given in these dictionaries. It is an action which is basically an intelligence action.

The actual meaning which is supposed to be embraced in the word is: "to examine the evidence in order to determine the situation," and that is the intelligence meaning, and then it could have a further: "so as to formulate policy or planning relating thereto." In other words, "What is the enemy going to do?" So the general can say, "Therefore we should . . ."

WHAT IS EVALUATION

Here is an example of what evaluation is, the type of thing expected of an evaluator.

I was looking at an org's graphs and all of a sudden I see a drift down of reserves and a level of bills. The bills are level, level, level — drift down of reserves, until all of a sudden it's about to cross and this was an org where we just changed the CO. So I say, "Hey, whoa! Wait a minute, wait a minute! This organization is spending more than its income obviously by the looks of this graph. So let's look into this just a bit further." I looked further and got more data and I found out that the org was running insolvent. The Data Bureau already had a report on this; I picked it up on another line. I just picked it up off graphs.

Further investigation found out that the new CO had taken over from the old CO and had inherited an extremely backlogged org — included backlogged bills. And the new CO had been sent in there on a set of garrison mission orders — and they just contained standard COing actions when they should have been MOs designed to handle the insolvency scene — forcing the org to promote and make income; then making an announcement that no POs will be signed except promotion, wages and utilities; then get in the dateline paying and forcing Accounts to dig it up out of all their mouseholes and all those bills that have been in there for a year or two and the stuff they didn't file and get a dateline paying system in. Then you start surveying like mad to find out what the organization can sell and then you start delivering, beef up your delivery lines and so on.

It wasn't any surprise to me to learn that that graph was a false report, of course. But this is no explanation. It doesn't mean the situation doesn't exist — the situation does exist — but the graph is a false report. That is a hellish outpoint all in itself. It's actually backed up by other data but you could have taken it this way: You could have seen the graph declining — that is reserves going down, bills staying the same and you find out it's a false report. At that moment, by Data Series, you charge in and investigate the heck out of it. Here's an indicator, then *another* indicator that's a false report.

Where did I count outpoints? I was counting them all the time. *One* is enough — a declining reserves graph and a holding debts graph — well, that was enough. So the counting was "one," and as I looked a little further I got "two" and then as I looked a little further I got a "three" and a "four" and a "five" and a "six." We did a handling and more outpoints showed up. Right as you are handling the thing more and more outpoints *will* show up so there is a point where you neglect any more outpoints, you can go on as a lifetime profession finding outpoints in one of these areas. It's enough.

We have actually done something with the Data Series which has never before been done. Other data evaluation systems have to do with the reliability of the observer, which determines if the reported fact is a "proper datum." But all of their work is done on computers and those computers are built against logic systems developed by the Greeks. But it is *data,* validity of, which monitors logic.

A black propaganda operation is almost totally concerned with feeding wrong data into the population and therefore the population cannot come to correct conclusions and their actions will be peculiar. There are experts in black propaganda and they're fully trained in it and they do it all the time.

Back of wrong data you will normally find an impure intent. So that somebody is giving you false reports is an evaluation in itself.

An evaluation first requires data. The absence of data you should have would give you an evaluation. We knew something was wrong with an area because all of a sudden somebody found out they weren't sending in their reports. The absence of data is an adequate evaluation that there is something wrong. And in one such case it actually took weeks to find out what was wrong.

If you find the outpoint, you're into evaluating a situation. You're just looking at data — you find an outpoint, you investigate that. You find more outpoints, you go along and say, "It's the thing that we're looking at now, what the heck . . . ," because you're obviously traveling away from the ideal scene or you've found something that went much closer to the ideal scene or something that didn't change it. You then look it over and say, "It's this point," and at that moment you can figure out why this is occurring. "Now, why is this occurring?" And that requires quite a bit of data. "Why is this occurring?" Therefore when you can say "Why," now you can handle.

What you want is the *outpoint* and an outpoint is a departure from the ideal scene. That tells you that there is an area to *investigate* and you can investigate it simply by going and finding more data and more outpoints and then as your data accumulates you can get *why* it's a departure. The accuracy of your Why then gives you the point which you will have to handle which is all very neat and there comes in your recommendation.

This is the trick on evaluation: You have to learn what is an outpoint, what is this outrageous thing and then that that cones you down. Now you could find all kinds of little points.

REVIEW

Having handled the thing or having done something about it, don't be too surprised to now and then find a lot more data suddenly emerge. In fact it is almost usual now that you've started to handle something for more data to emerge. But you have to look it over. You have to say, "Well, have we *handled* it? Does this data confirm our Why or doesn't it confirm our Why?" And that's all you do with that data — it's confirmatory.

Sometimes you get data after the fact, after you've taken action. That is a review of your evaluation. When the data comes in after the fact, there's another step involved here.

You review the situation and all of a sudden you find out you were looking at a heck of a wrong Why. One of the first things that will tell you you operated on a wrong Why is that the stats went down — because it departed further from the ideal scene.

You get injustices and that sort of thing coming out of wrong evaluations, so this is one of the reasons why you watch an evaluation in your line of country — you watch an evaluation after the fact. Was it true? So there's a confirmatory step which isn't mentioned in the Data Series — "Was that the right Why?" The Data Series does mention it's whether or not the stat goes up. But it's worse than that: "Did you have the right Why?" or "Did you shoot down the wrong man?"

Now any time you find thirty people on staff being removed because they were suppressive, you *know* they had the wrong Why, because the percentages are wrong. It's just as mathematical as that. If they've done that then I can also assure you they've left the suppressive on the staff and I can also assure you the guy that did it was suppressive.

FAMILIARITY

We have a considerable amount of technology which is *administrative* technology, which gives us an ideal scene, and with which we must be familiar in order to evaluate and handle. We would have to be as practiced in this as in the building of armament factories or running navies or building toy balloons or trying to get housing furnished to the great unhoused if that's what we were doing — you have to have some familiarity with the type of scene which you're handling.

If you're good at this you don't go on wasting your time and energy. You find the right Why, you set it up, you make sure that it *does* get set up — that there's nothing more you have to do with it and then that's that. Sometimes that takes quite a while but note that if you're immediately pressing down this Why all the rest of the way and you go on past the point where you corrected it — the thing *is* corrected — now you're handling a no situation.

If you didn't have evaluation you would find yourself handling no situations and neglecting tough situations and not taking advantage of good situations. And that is how you get a bureaucracy and that is how you get areas all overmanned.

CLOUDING UP A SITUATION

Occasionally you'll find a scene wherein a person's or area's PR is greater to him than production — PR, personal PR, means more than production. And that is a characteristic of a suppressive. He'll fog the situation up with big PR about how good it is so it can't be handled. So there's somebody sitting on those lines who is a bit suppressive.

THE WHY

You have to know when you don't have a Why. It is very, very important to know you don't have a Why.

The end product of your evaluation could be said to be "What do we do about this?" In other words, your recommendation could be said to be the end product. Actually that's a short circuit. As far as your investigation and your data analysis is concerned your first target, the Why, if skipped will defeat the end product of your evaluation. If that Why is valid then you can handle.

A Why is just this: It is the *reason* there has been a departure or closer approach to or an exceeding of the ideal scene.

What will defeat you continuously is trying to find Whys in no situations. You won't find a Why. If you can't find a Why readily then you can possibly suspect that you have a no situation.

A Why, by essence, is something you can do something about. You have to have a recommended action on top of the Why.

The Why is something which departed from, the reason it departed from or the reason why it bettered the ideal scene or got closer to it. It is a Why you can use and which will bring you a better scene.

Therefore the definition of a Why is: It must be something which will permit you to bring about a better scene — not necessarily bring about the ideal scene. You might actually have a better scene than the ideal scene!

We've described the ideal scene as so-and-so and all of a sudden a Why suddenly emerges which actually makes the ideal scene look pale. Taking the ideal scene of a moderately affluent org — we might all of a sudden move into a situation where the ideal scene was quite something else and we find out "How come all of a sudden Keokuk has made 8 million dollars in the last 13 days?" How come? We don't have an ideal scene anymore.

IMPORTANCE OF HAVING A WHY

We have a system of data handling which is superior to that of the intelligence organizations of today. I can say that because I know their systems and they don't hold good. Imagine somebody saying, "Well, we shouldn't pay any attention to Agent 622's reports from Kobongo because they're false." Oh? That'd mean one had a turned agent or an agent that wasn't working. In other words, it isn't meaningless, it's not something you discard into the wastebasket. Now a good intelligence officer doesn't always discard this. He says, "Well, it's false data so therefore he's probably been taken over by the enemy." And he does make some sort of hit at it.

But there are *other* outpoints that they would never have noticed. "A datum is okay . . ." this is the general think — not just of the generals but this is general intelligence think. "Of the data we receive, a great deal of it is not useful because it doesn't come from reliable observers." Well that's a hell of an outpoint in itself. If an enemy battleship was seen on the coast it wouldn't matter who saw it — intelligence organizations would not pick it up unless it had been observed by a trained officer. "The town could not have been shelled because no reliable observer put a report in — there was no artilleryman to tell us whether or not . . ."

So our system doesn't begin with "The Slobovians are building 85,000 panzer tanks, and that's by a reliable observer because Agent 462 has given us factual reports in the past and it's confirmed by aerial observation and satellite pictures . . ." So what! The intelligence would be, "*Why* are the Slobovians building this many panzer tanks? Now, is this a lot more panzer tanks than Slobovians normally build?" Because maybe Slobovians go in for a lot of building panzer tanks so they can call them T-something-or-other and say they were invented in Slobograv. Why? And we right away have a new brand of intelligence — Why? Why are they building these panzer tanks? One is the fact that they're building these panzer tanks, is that an outpoint? Well, is it a lot

more panzer tanks than they have built before? Is it a lot less? Did they build a million a year and are only building 200,000 a year now?

Now the officer evaluating this hasn't any Why, he hasn't anything so he makes the supposition that the Slobovians are now easing off. "Yeah, well General, the Slobovians are now easing off." "Yes, Mr. President, the Slobovians are now easing off and everything is going to be fine." The fool! What's the Why? Where's the Why? He assumed something — he didn't investigate further. He didn't look all over the place and find a whole lot of political ramifications and add it all up and so forth. Now, had he known about it he would have looked from that data to more outpoints and he would have found something or other — building the tanks for Bongoland so that they could knock out their neighboring country. Why? Why? Because they have a contract with Bongoland to furnish them with tanks. He could've found something like that.

You get these unwarranted conclusions because they don't have the mechanism of asking "Why?" and they don't investigate until they have an adequate Why that explains it. When you've got a Why you can handle.

THE CHANGE

One more tip on this whole scene. If you can't find the Why, you revert. I learned this about life out of plant research. I found out that you went back to the point of major change in a greenhouse or a garden and corrected it the second you saw the plants dying. You required, then, a logging of everything that was done. If you had a log of everything that was done you could get the date and the change. You knew the date they started to wilt so what change was around the vicinity of that date? And you inevitably and invariably found a huge change had taken place, not a small one. And the tip is that if all else fails, why just go back to your major change and you can do that by stats, go to major change, and so on.

You won't always be right but you're operating on a general Why — there was a change. We suddenly failed to require something. Every once in a while you really will be scattering around trying to find this.

This works in almost all situations to some degree, what change was there. But we scatter all over the place. It has a liability. It tends to wipe out improvements. If you go back to the point of high stuff all the time, all the time, all the time, you're pegging yourself into the same pattern where, as a matter of fact, there might have been some better patterns. There might have been a better Why in there than just a change of pattern.

NEW WHY

Once in a while you'll have found a Why and handled that, but find it keeps slipping out again. For example, an org having to be told to keep in its FP No. 1. FP No. 1 resulted from an evaluation of financial difficulties. That was a Why at one time and has since become a standard action — but where you keep having to say to an area "Get your FP No. 1 in" — now, WHY do you have to keep getting in FP No. 1? The Why is not that FP No. 1 is out — we have gotten that in as a practiced action. Why does it keep sliding out in this area? There could be several things actually.

If you have to keep saying, "Get in C/S Series 25 so that you do have a D of P so that people do come in and are invoiced and so forth," you are obviously running into a Why of why something keeps sliding out.

WHAT IS A RECOMMENDATION

What is a recommendation? Actually — usually — it would be recommended if somebody else were going to execute it. You have a recommended program and then from a recommended program you have an executed program, so at that moment you shifted your hat. You're no longer an evaluator, you're an executor or an executive.

If your evaluations, that wind up in Whys that wind up in recommendations, are going to *autonomously* function — that is to say, singly and by itself function — without regard to any other entity or activity, the next thing you know you're going to have fourteen or fifteen programs which are in direct collision which will produce sufficient confusion to reduce the stats. Then you, yourself, will wonder if you've found the right Why because it didn't work. Whereas the reason could be entirely different. The reason is your recommendation was in collision with other Whys and recommendations and so operated to block other actions which were vital to the continuous operation of an activity. You can kill your own recommendation.

If you were in a position where you were going to independently of other evaluators execute all your actions, you might wind up with a mess — you've got your neck out as an evaluator.

The essence of a recommendation is "agreed upon" and after there is a recommendation, there is an "agreed upon" before there is execution.

An agreed-upon action means that you'd have to agree with other bodies of data which people had — not their personality — other bodies of data. If you have data which is contrary to an action which is being proposed, you could be put in a position of cancelling or trying to cancel or recommending a cancellation of a senior's order. Therefore one has to have "agreed upon" before execution.

When you are collecting data you have a torrent of data coming in. You are collecting data, collecting data, collecting data, collecting data. If that data is not evaluated, it is useless. It is just a useless expense. The only way that data is of any value at all is if evaluations are done on it.

Any independent order given without the benefit of the other evaluations would be a risk. It isn't agreed upon person to person, it's agreed upon data to data. The only agreement would be on whether there is a situation or a no situation, a good situation or a bad situation or a no situation. There'd have to be agreement on that point and there would have to be an agreement on the Why. Only then could you get a coordinated recommendation.

EVALUATE

You've got to do evaluations. If you don't do evaluations you'll be insufficiently informed to be a competent agreer or disagreer. You'll be insufficiently informed to be sufficiently efficient to get the show on the road.

Take advantage of the tremendous volumes of data which come in and, by doing evaluations, provide a sufficient running record of any and all existing situations in your line of country so that there is a general view of what is going on so that the data can be looked at, looked up and one is sufficiently informed so that he can make efficient judgments — and that will decrease the amount of work done on this and that, that doesn't really handle anything.

And it amounts to fewer orders which can then be enforced. It amounts to prosperity because one of the Whys we find on occasion is that there are too many orders drifting around which haven't been executed. One winds up operating on somewhat of a jammed communication line just jammed by volume. The guy that's reading all this stuff is out there and he's got noise and he's got this and they've got bill collectors and he's got something else and so on. He never has time to read it. He doesn't know what the situation is and so forth.

One could also, without proper evaluation, easily issue an order into an area with a hidden Why — which could destroy it.

And the speed of action determines the degree of loss — and that is a rule. The speed of action also determines the degree of gain. And speed has a price. An organization which is not doing well, its Why not accurately found for eight months is a loss for eight months each succeeding week. If an organization should be making fifteen thousand dollars and is only making two thousand dollars you're losing thirteen thousand a week every week that you don't handle it. It's speed of gain or loss.

DATA SERIES 42

DATE COINCIDENCE

(Extracted from an LRH talk to Staff Aides on 18 May 72.)

STATS AS THE FIRST INDICATOR

The first indicator is stats. If you were doing evaluations without looking at stats, that would be silly. You can take a stat book of an org and look over its GDSes and know their interrelationship and find the outpoint, and then from that outpoint you will know what part of the org's folder to read. If you are doing evaluations by reading the whole folder, you're being silly. You're not interested in that, you're interested in this outpoint because that's your first outpoint. Your first outpoint always occurs in stats.

One outpoint, from stats, was "tremendous quantities of bulk mail being mailed at vast cost after the stats had been brought up by phone regging, and then the stats collapsed." That was the first oddity that was noticed from some Dissem stats. So it was a *stat* oddity. They were busy phone regging and they made a lot of money, and then they spent it on bulk mail and went broke. So there was an oddity here. It meant the GI did not match the bulk mail. So it's an outpoint. It's inconsistent. Contradictory. Something's false. So right there, you're looking at a great big cracking outpoint. One or the other of those facts is a lie, or something's wrong. And we find out the real outpoint underlying it is wrong target. It's just number of pieces being sent out. They were mailing out fliers several times a week — sending scraps and calling it bulk mail.

All right, so you got your first outpoint in your stats. Now, just the fact that an org's stats are down is an outpoint: An org has a monopoly on mental healing. It had no rivals of any kind whatsoever on the whole planet from one end to the other. In fact they've got no rivals in the field of healing of any kind. What the hell are they doing with their stats down?

So you look for a down stat. Having found a down stat you look to see if that org ever did make money, if it was ever affluent. Just taking it from the standpoint of GI, was this org ever affluent? *If* the org was ever affluent, it must have been doing something right so you've got something that approximates its ideal scene.

You haven't approached data files yet. That's why stats are separate from the data files.

LOCATING A COMPARATIVE

So here are two conditions: (1) the stats are down, and (2) you can't evaluate one thing, as you learn in the Data Series, unless you have a comparative thing. You have to compare it with something. So you can find a period when their stats were up.

You find out that in July of 1969 Kokomo was really booming. It had nice climbing stats and they went up and up and up and up and up. And that rise started on the 6th of June. What did they do in May and June of 69? Those are the two folders you want — anything you can find out about that org of May/June 69. That gives you something dimly resembling an ideal scene. It isn't *the* ideal scene, but it is certainly an upstat scene. That gives you a comparative.

If you were hot you would use your telex lines to fill in the missing holes. For instance, if you don't understand something or if it looked like they moved in 1970 and you can't find out locally and you don't seem to know whether or not they did — and location seems to be something important here — you could send a telex to somebody who might know and say, "Where were you located in June of 69? Where was this org located? Can you find out from anybody?" It might be important you see. This is just a collection of a little bit more data. You know that the org was doing something at that time that it isn't doing now.

I did just this when I wrote the PL "Selling and Delivering Auditing." I looked back when HGCs were really making the money and wrote that PL. This PL is in use in one org and they're really going to town. They're using the same system. A guy comes in to sign up, they say, "No, you can't sign up for one intensive, thank you, you'll have to buy seven," or something. So he does; he pays the money on the barrelhead. That PL comes out of a comparative — a comparative of HGCs not selling much auditing and having a hard time doing so, and what they were doing in an earlier period.

So, when doing an evaluation (1) look at your stats, (2) find your outpoint in the stats, (3) find some comparative — find some period of affluence for the org if you can, to give you some ideal scene for that org. That requires something of a *pluspoint* evaluation. Now you can do your *outpoint* evaluation. Because you've already got the outpoint, you don't have to read 8,752 folders.

ETHICS SITUATION

A while back, I asked the Data Bureau for the folders of a particular downstat org. The first folder that came up wasn't even a complete month's folder. I looked through the folder, read scraps of what I was reading, picked out the reports I wanted, scanned them, pulled the outpoints out of them, counted up the outpoints as to where they were going, and the thing just fell apart. And that was that. It showed the CO was unaware of the fact that Personnel was letting him down. That was their Admin Why. And obviously the CO had to take that person in there off. And obviously there was something wrong with this CO. Now every evaluation done on that org since is grooving straight on down that same Why. We've tried to make orders and we've tried to do this and we've tried to do that, but now an ethics situation has developed out of the thing. We got the Admin Why all right, but an ethics situation developed as we tried to get this in. And notice that THE ETHICS SITUATION DEVELOPS WHEN

YOU TRY TO GET IN THE ADMIN OR TECH WHY. So you don't necessarily have your Admin or Tech Why in the first three minutes of play.

In another area the ethics situation developed to such a degree that it then emerged — after an observation mission, after a handling was done and orders were directly issued — that they did not execute a single one of them. They were told to revert. They did not. Therefore an Ethics Why was looked for.

Now I've just found out why people can't put in ethics. They don't know investigatory tech, and possibly in some cases their own ethics are out. If you put their own ethics in, they will get in ethics further. The reason they assign broad conditions and the reason there are so many Comm Evs is they don't know how to investigate.

WHO WHEN

Someone was given an evaluation to do and had been on that for five days. I kept asking all this time, "Where's this evaluation?" People must think I'm rushing them. Evaluators are slow because the evaluation is not being done in this sequence: (1) stats, (2) who was on where.

I gave an order to an evaluator to find out exactly when did a certain person come to Flag, and exactly when did the person go back because that would give you a stat comparison. That was how I found this person was the man-of-all-work and the scooting genius of that org. Now you're talking about ethics; it's the police action called date coincidence. It's how you locate geniuses and murderers. Body found in swamp. Her cousin arrived in town on Tuesday. Body found on Wednesday. Guy departed on Thursday. That's all the police need. That's called date coincidence. That's old-time investigatory tech. It's still with us.

So, when were they gone out of the org, and when did they arrive back in the org, and what happened during that period of time? Important!

In the case of this particular person, I found out that two other execs could leave the org and return and nothing happened — but when this person left, the roof fell in, the front steps collapsed under everybody and the staff went on vacation. I traced this down and I found out that she would run around the org wearing hats in rotation. She dived into the Tech area and wore the Tech Sec hat for a while, and then she dived into another area and she wore that hat for a while and the stats would go up. In other words, she supported that area by punching one area at a time. That was the way she was operating. So if she was all over the org like that, her obvious post was Deputy CO. We put her on that post and the org has done well ever since.

Now that's a sort of ethics action in reverse. That's looking for who really pushes it. You don't just keep on looking for tigers. Tigers are probably more numerous than geniuses, but you could find that certain people have a *vast* effect on stats. This is how you evaluate a personnel scene. In another org, a guy took over and the place has been crashed ever since and it was right square on the stats. There is your most obvious ethics investigation by stats.

CONTENTS
ORG BOARDS
INDEX

When you don't know, you've got to send an investigatory mission and it's got to be run well. Otherwise they just wind up shooting all the people that the staff complain about.

If you don't operate on a comparison every time — comparison on Admin Why, comparison on the stats, ethics comparisons — if you're trying to operate on a single datum, that single datum won't buy you any pie because it has nothing to compare with.

SUMMARY

What the Data Bureau gives us is experience. And that is huge files full of experience. But you've got to recognize what you're reading. You don't read everything! If you do you're omitting an analysis of the GDSes and an analysis of who went on *when* and *where* at a good time and a bad time.

What are you looking for? You're looking for the stat. Look at your GDSes. This is for your Admin Whys. That tells you the big outpoint, that tells you what information you're looking for in the files — and you're only interested in that information. You start counting up that type of information and see where it lands, and the Why will practically jump out at you out of the folder. It is so easy! It just leaps right out. But you have to know what you're looking at.

In writing up one eval an evaluator verbally gave me more valuable data than she had put into the eval. She was quoting reports. All you want to do is quote the steps of your investigation.

You have a criterion when you've got your evaluation all done: your handling has got to be bright — it's got to be a bright idea that will actually drive those stats up — and something which can be operated. And if you do an evaluation that cannot be operated at this stage of the game, you're just wasting your time. Look at your resources. What can you do with what you've got while you improve what you've got? It will all have to be done by a gradient. So the worse off things are the brighter you have to be.

When you do evaluations you've got to be able to operate the resulting actions. If you write something that can't be operated nothing will happen. That at once tells you whether you have a good evaluation or a bad evaluation.

Do your evaluations in such a way that they are dead-on — bang! bang! bang! — and then, that being the case, they have got to be something that can be operated. And the next thing you know your stats will go up.

DATA SERIES 43

EVALUATION AND PROGRAMS

(Extracted from an LRH talk to the
Flag Programs Bureau on 28 Sept. 73.)

CAUSING STATS

I've learned this over the years: The entirety of our stats are internally caused. WE CAN CAUSE STATS AT WILL. External actions don't affect them.

A newspaper can write reams of entheta and it doesn't affect our stats at all. We get good publicity — it doesn't affect our stats. It's totally internal.

The public demand is apparently exactly as great as we put the wherewithal in their hands with which to demand — apparently exactly proportional. You get as great a response as you require.

Therefore, the more efficient your org is, the greater response you will get. It's that elementary.

The test of an evaluator or executive is: "Can you get your org to do a constructive thing at once without any backflash or any nonsense, and will it occur in such a way as to increase stats promptly?" If so, you're a good administrator. If you can't do that, we have all kinds of paint to scrape.

It's just that: The guy can produce an effect or he can't.

And if you run a managing body that way, all of a sudden the staff will get happy and cheerful producing effects; everything will be fine — because they'll become at cause.

That is the essence of hatting. The person can then come up to cause and he'll get sane, productive and cheerful.

Actually, it takes a very able guy to do an administrative line. A ditch digger has to have a solid line of his arm and a shovel, and that's as far as he can produce an effect. That's why he's a ditch digger.

Now, for a guy to produce an effect at 7,000 miles without any solid beam — he has to be right on the ball. He has to know his business.

SPEED OF EVALUATION

There was once a situation in an org which was very interesting. Apparently the ED was stopping the reports of the LRH Comm and Flag Rep, so no one was about to find out what was going on in that org. But if the manager had been on the ball, all he would have had to do was to look at that data file and find those reports missing and know that there was something wrong — and it would have been detected a long time before.

What you're up against is that most of your evaluation is on omission, and the toughest outpoint for anybody who is not familiar with the scene to recognize is an omission.

THE SPEED OF RECOGNIZING OUTPOINTS DETERMINES THE SPEED WITH WHICH ONE CAN EVALUATE.

You wonder why it takes people so long to evaluate. It is simply that they are too slow in recognizing an outpoint.

THE INABILITY TO RECOGNIZE AN OUTPOINT IS REASONABLENESS.

It's that thing, reasonableness. We've been talking about it for years. That's just the inability to recognize an outpoint.

There was a fellow out in the field saying, "I think we have done all right in the past" — meaning "without the Data Series" — "in our thinking and planning." He didn't think he had to take a Data Series course or something. Whereas I was literally getting rivers of outpoints from him and his area. He didn't recognize them as such.

Well, what he didn't appreciate is that this is a brand-new way of thinking. Man prides himself on being logical so that he has never based any system on illogic — except humor. You have to learn to think backwards — you learn to think backwards, and boy can you think forwards. It's like a dichotomy, positive–negative. If everybody omits the negative all the time, they never get to the positive.

A lot of people are on a stuck flow of being sensible and sane — and that winds up in stupidity. So they get reasonable. Their confront of evil isn't up to it — basically, their confront of outpoints.

THE ABILITY TO RECOGNIZE OUTPOINTS WILL EXACTLY MONITOR THE SPEED OF EVALUATION AND THE ABILITY TO HANDLE THE SCENE.

An evaluator cannot say, when he hasn't received any reports for 2½ months, that he doesn't know what to do because he hasn't received any reports. He'd better be able to recognize an omitted report when he sees one and that there is a situation and he had better take action to remedy that situation NOW.

INACTIVITY

Now, nobody ever does nothing. They never do nothing. You have to look around to find out what he IS doing.

If it's an exec who can't get juniors to produce, he could probably be putting a stop on production lines. A Why is findable to such a situation. That's probably an ethics scene. But you still will find a Why. You always find a Why for the situation. In other words, he has a personal situation of some kind or another. He might be able to function, himself, as a junior or he might not—but for a guy to sit there with completely idle staff members and not notice it, with their areas wrapped around a telegraph pole, is quite reprehensible.

In investigating one inactive Esto, I found out she was operating under an order that she was not to bait and badger until she was trained on it—and there were probably many other things she "was not permitted to do." She accepted an illegal order not to do certain Esto actions. We found one and probably, if we had investigated further, we would find more. In the first place, if anybody has read the Esto Series, he'd find out that you are an Esto (it says it right in the beginning) and that's it. It doesn't matter if the guy has studied it or not studied it, he's an Esto and he's supposed to do the job. So it was a violent policy violation as well as keeping someone from doing her job.

EXPANSION PROGRAM

An expansion program is for getting an org built. It's based on an evaluation for that org. There is a way you could go about this. Suppose you wrote Kokomo and said, "What should be done about Kokomo?" You get a bunch of answers from the whole staff—compulsory answer, not a couple of guys. Evaluate from that what their tone level and that sort of thing is. And you could then form up, based squarely on policy and forming the org, an expansion program.

The expansion program is actually a very basic org rudiment function, but which would be adapted to that org, and within the reality of that org. It's highly specialized and it's terminable. The person executing it, when he gets through with the thing—that's the end of that one. Now let's get another entirely new program.

You could actually do it on a blanket basis where each org was treated as an individual org. Then you'd know what policies to get in in this org. You just ask them, "What should be done about Kokomo?" "What should be done about Keokuk?"—they'll tell you. Then you could go down to your Data Files and do an evaluation for the expansion program.

You can thus use knowledge of the org's troubles and the staff interviews as the basis for an evaluation.

There has to be an immediate organization for production, according to the prod–org system. However, long-range, long-term organization actions have got to be done by somebody because the prod–org system tears an org to ribbons. There's got to be somebody putting an org there who's not directly involved in that immediate scene. He's got to put it there adroitly enough so that what he puts there expands its production so as to pay for the additional organization.

It's quite neat, that type of program. As they get executed along the line, they wind up with an increased production. Every three or four targets that are done, why, all of

a sudden you've got more production. There could be some good long-range targets like "Get 30 auditors" — probably could take a year or more to exhaust such a target.

But note — such an expansion program wouldn't go on your production program execution lines at all. Your long-term organizational actions go on another line than your immediate production actions.

PRODUCTION PROGRAM

Such a program is something concerned with handling an immediate situation which had to do with immediate production — right now. Such as:

WHY: Division 6 doing all the sign-ups for Division 2.

HANDLING: 1. Get a Registrar on post in Division 2, right now.

2. Then get an Advanced Scheduling Registrar on post immediately.

3. Then get three letter writing Registrars on post at once.

4. Get them functioning, production, immediately.

It's a "right now" scene.

A short-term production program ought to expire within thirty days — it becomes staledated within thirty days. Some of them become staledated within ten or fifteen days. So you need a very hot, very fast line of very quick compliance.

It already takes quite a while for the reports to get to the files through the mail so that you know what the situation is. You're already ten days behind the gun — ten days, two weeks late. And then it's going to take maybe another week to get it assembled — to know that there is a situation and evaluate it and get it through and ready. So you're operating on about a three-week average comm lag. You have to make up for it at the other end of the line — get this thing done now, now, now.

If you've got a Flag Rep there, the Flag Rep will get it done.

The eval probably will not save the bacon of an org for the next two years. It will be lucky if it keeps the stats bolstered for six weeks — then something else will go out. By that time, why, Div 6 will have become completely confused because it is not now being permitted to do all the registration of the org, so therefore it would have gone out of existence, and the Registrar would have left, so now we would have to evaluate and handle Division 6.

It goes ticktock, from one situation to another.

There are different types of evaluation. There'd be a divisional evaluation. There could even be a departmental evaluation. There could be an org evaluation, an executive level evaluation and so on.

You could have several evaluations going at the same time, but they would have to be different divisions or areas, otherwise you'd cross up like mad. Normally speaking and in theory, that would be possible. But in fact a competent evaluation would find the imbalance between divisions.

The operative word is current evaluation. You could push a current evaluation. How wide is present time? Well, that's a matter of judgment, but a year-old evaluation would be pretty much not current.

You should be able to turn out an evaluated program that applies to Podunk Org and get it executed forcefully and they would start flying. And then you should be able to do an evaluation on the policy missing in such and such an org and be able to issue it on the LRH Comm line and get them pushing right straight up the line into a form of org and a production basis.

If you can put evaluated programs out on those two lines: the production program going to the Flag Rep, the expansion program going to the LRH Comm, you've got it made. And if you've got anything else standing in the road of that you should get rid of it. And that's the way the orgs would boom.

FIRST TARGET

Your first program target must always be a production target — but you can't, in actual fact, write a pure production target. It would be impossible to write a pure production target because somebody would have to do it, and the moment that you have somebody there to do it, you have organization. So there is a certain amount of organization that comes into it.

If I were evaluating an org right now, say its Dept 7, I would have to include in it, as its second target, beefing up Dept 7. First target would be for Dept 7 to do anything it could to handle its collections. And the second target would be to beef up that department forthwith, bang bang! Otherwise the production would not continue. It would break.

So, as mentioned earlier, there has to be immediate organization for production.

TERMINABLE TARGETS

Now, how do you like a target like this: "Maintain friendly relations with the environment." How do you like that target? It is utterly, completely not a doingness target. It isn't a target at all!

Now, if it said "Call on so-and-so and so-and-so and make them aware of your presence . . ." and so forth, it could have a DONE on it.

Targets should be terminable — doable, finishable, completable.

REPEATING TARGETS

There is such a thing as a repeating target. You can accomplish it many times — it's like when you do org rudiments. Every time they do one of those targets a compliance is added to the compliance stat.

This is especially true of some targets in expansion programs.

FOUR–PRONGED ACTION

In operating orgs, you've got a four-pronged action, a division of duties:

— We've got the form of the org and its basic policy and tech being driven in by the LRH Comm. The LRH Comm is gunning these orgs up to expand. You have to get in certain structural functional actions for an org to expand. So you've got the LRH Comm working on founding and expanding the org against production, for real. She isn't organizing for nothing; she is organizing those important parts of it. So you could do an evaluation for an expansion program, and the LRH Comm could sit there and beat that program in, and that program mostly has to do with policy. This is your long-term organization.

— The Flag Rep drives in the production programs that remedy the current situation and production actions. Those programs are based on evaluations of the current status of an org from the viewpoint of production, not from a viewpoint of its organization. You do have to do a certain amount of organization to get any production, but it's short-term organization.

— You've got the general org being run on its day-to-day basis by what was once known as the Assoc Sec and is now the ED.

— You've got the Office of Special Affairs handling the public and acceptability of Scientology, handling the public, handling legal and handling other things. They're outward facing.

There you have your four-pin structure of your org drive. Those lines go very sleek.

DATA SERIES 43-1

EVALUATION SUCCESS

(Taken from ED 552 Flag,
4 Nov. 74, EVALUATION SUCCESS.)

To show that evals on individual orgs and getting programs done *DOES* raise stats the following brief review is published:

Around mid-July 1974 I got on the eval approval lines for about a week and had orgs of one continent evaluated by some Flag evaluators.

We got several evals through, severely according to the Data Series rules.

Here are the results of seven of them.

1. Program was reported fully done. Stats went up.

2. 18 July eval. Program was almost fully done. Finance got bugged. Org crashed 22 Aug. 74.

3. 22 July eval. By 15 Aug. stats had gone UP.

4. 21 July 74 eval but not started on until 26 Sept. 74 as Study Manuals were delayed on which eval depended. Org stats after eval began to be done went UP and by the end of Oct. hit highest ever almost across the boards.

5. 20 July 74 eval. Started on 10 Aug. 74. Half done. By 24 Oct. stats went UP.

6. 23 July 74 issue. Bugged. Not completed. Stats went up first couple weeks. Org crashed 24 Oct. 74. (Eval was also cross-ordered by removal of CO.)

7. 23 July 74. Three-quarters done. Stats went UP.

Thus five out of seven of the above evals were successful.

The two that failed were obviously insufficiently broad as other matters got in the way of them. The evaluator could not have had the real situation. Means not enough preliminary work to find the area that should have been evaluated.

VERBAL TECH

Verbal tech on a DSEC should be severely handled if found.

Note that the evals as above were very *purely* supervised referring only to departures from the Data Series PLs.

Pure eval per Data Series 33RB was the push on getting the evals done. I was simply demanding full Data Series PL application.

The reason for verbal tech is Mis-U words!

FAILING EVALS

It is pretty easy to tell if an eval is getting done or if it is failing. The two poor evals in the seven just weren't watched fast enough by the evaluators. You cancel a failing eval fast and do a better one.

Failing to cancel or redo a failing eval on an org would be the real reason for that org continuing to go down.

SUMMARY

If you got 5/7ths of all our orgs purely evaluated, no nonsense with verbal tech, you would have booming Int stats!

Just like pcs — unprogramed pcs fail — and pcs audited with hearsay tech fail! Orgs without evaluated, pushed programs *for that org* tend to fail. And evaluations done on hearsay tech are a waste of paper.

How about it?

A boom or crash.

It's up to YOU.

REMIMEO

DATA SERIES 44

SUPER EVALUATION

(Taken from LRH OODs item of 15 Oct. 73.)

I have examined four evaluations recently and have found in each case that the evaluator had not gone to the trouble of looking in obvious places for data.

In each of these cases, personnel whose personnel folders had not been looked into and whose ethics files had not been examined were concerned. In the last one, a person was being proposed for promotion to a high executive position in an org while the stats for the past week demonstrated that his area was seriously downstat, the matter even being mentioned on the current battle plans.

It is not how much you read, it is where you look. In the data files, if one is examining the statistics of a division, one does not read all manner of reports from other divisions and other personnel. One has to be selective and right target to get his data.

Statistics (as fully outlined in statistical management PLs) are the dominant factors in an evaluation, and most evaluations begin on the basis of statistics which are either sufficiently high to merit examination so as to be reinforced, or are too low to be viable. These read in conjunction with other statistics usually give you an org situation.

When one discovers a series of outpoints, there is generally a situation underlying them.

From the statistical trail, or the gross outpoint trail, one can locate a situation. The situation is then evaluated by looking for and finding the exact data which applies to that situation. From this one can find his Why, and once this is found he can get a bright idea.

A program can then ensue which terminatedly handles that situation.

Evaluations cannot be done in any other way. The moment that you apply humanoid think to the subject of evaluation, you lose.

In the last evaluation I looked over, the evaluator obviously had not gone to personnel files, data files or any other files but had simply read some PR despatches written by the guy himself and had taken single-source data and decided to promote the person to the control of an area. Statistics demonstrated at once that the person's

NAVIGATE
FIRST PAGE
SEARCH

AGAIN
EXIT
CONTENTS
ORG BOARDS
INDEX

stats were down, that practice evaluations done on that very org existed, and that the ethics and personnel files of that person would never have suggested any promotion and on the contrary would have suggested demotion. This would have made a very dangerous situation in the area, would have victimized a great many good people, and would have played hell with Flag statistics.

Persons "evaluating" without having looked at the vital data concerned with their evaluation are subject to a Court of Ethics on the charge of FALSE EVALUATION.

While this might be looked on by some as a deterrent to evaluating at all when evaluations are vital, remember that it is better to handle one person, the evaluator, than to tie up and maul a thousand people with a program based on a false Why.

Evaluations not only can be done but are quite magical in handling things when the evaluator knows what he is doing and when he looks for the information he needs to evaluate in the places where that information exists.

It is out of correct and brilliant evaluation that high stats are made.

We have superlative tools, we must use them right.

FOUNDER

HUBBARD COMMUNICATIONS OFFICE
SAINT HILL MANOR, EAST GRINSTEAD, SUSSEX

HCO POLICY LETTER OF 27 SEPTEMBER 1978

REMIMEO

DATA SERIES 45

EXAMINING RESOURCES

One of the reasons evaluations fail is because the evaluator does not take stock of resources.

It is vital that you examine resources when evaluating before you plunge into any handling, and resources belongs just above handling on the evaluation form.

Resources sometimes turn out not what they seemed, so when I say "examine resources" I mean look into them searchingly. Were you ever sure that you had $50.00 in the bank and $20.00 in a teapot only to find on closer examination that you were overdrawn at the bank and the teapot contained an IOU whose signature you couldn't read?

Sometimes you think you have resources you don't have even when there is total agreement on every hand that you have resources. Take for instance Clerk X. It is "common knowledge" that he has been around "Department 5" for years and is a "good clerk." So you make him head of the department without going down and inspecting his area. What will happen to your evaluation and "Department 5" if that undone inspection would have revealed unfiled backlogs 10 feet high, lost supplies and equipment and an office mainly used for plotting mutinies? This may be an extreme case but some shadow of it lies behind most failed evaluations. The evaluator just didn't examine his resources and thought he had what he didn't have.

There is one type of program you can always predict will fail, it begins "Hire a _____" or "Recruit a _____." When sending a mission out on such orders, you know you won't hear from them for 6 months because the program has said, in effect, "acquire nonexisting resources."

If you do an evaluation on almost any subject and omit an examination of resources and the resources section, your evaluation may lay an ostrich egg. "Appoint Joe Blow, who is a trained Personnel Officer," may trip over the fact that he left the company 5 months ago and has not been heard from since. The eval will bug at this point. That is because the evaluator didn't examine resources.

You sometimes have to gear down your bright idea and handling from "Buy Wall Street" to "Set up a peanut vendor stand on Bleecker Street." But the point is your evaluation will succeed where otherwise it will fail.

Almost all evaluations actually have the overall goal of preserving or acquiring resources. So don't omit an examination of the resources you do have to work with and their accurate and exact character from your evals.

HCO POLICY LETTER OF 4 JANUARY 1979

REMIMEO

DATA SERIES 46

THE IDEAL IDEAL SCENE

Have you realized that if you have an incorrect ideal scene, your program will be wrong?

In using the Data Series, some evaluators tend to toss off the ideal scene as a sort of afterthought — possibly because it is part of the form of evals. To do so can be quite fatal to the success of the eval — and it can result in the wrong ideal scene!

So always work out the ideal scene with care. THAT is what you are trying to achieve with your eval.

HOMEWORK ON THE IDEAL SCENE

We know that homework may be necessary for the data section. But have you ever thought that the ideal scene may also require homework?

I recall a ship's galley once that couldn't get itself unscrambled. So the cooks and stewards were sent over on a tour of a posh cruise liner. They were amazed at what a real ship's galley could look like. They had seen an ideal scene. Until then they didn't know why they were being harassed by the officers. They got it.

If you can imagine Sitting Bull, the famous Indian war chief, trying to evaluate "Queen Victoria's last grand ball failed" as a situation, you would see that his eval was likely to be rejected. For he wouldn't have had a clue what the ball SHOULD have looked like. But, as Sitting Bull was a pretty smart Indian, if he had done his homework on the ideal scene of a queen's grand ball, I am sure the eval would not only have passed but the NEXT grand ball would have been a howling success!

So homework is often quite vital on the ideal scene.

Not only can a person establish what an ideal scene SHOULD be, he can also establish what it COULD be and that may be a long way ahead of old accepted ideal scenes.

EVALING FROM THE IDEAL SCENE

It is possible (and often very necessary) to "evaluate backwards"; that is to say, to START with the ideal scene.

If you have something you want to bring about — some ideal scene you desire — and simply shuffle off toward it, don't be surprised if you never get there or achieve it. The realities and conflicts of life have a habit of intervening. What they call the "vanishing illusions of youth" occur simply because youth, thirsting to be a movie star

or a great lover or a fireman, seldom sits down and does a thorough eval first that finds the barriers that will permit a program that will work.

If one sets up an ideal scene as an ambition — such as the org booming — it may just stay an ambition one remembers in his old age instead of a concrete occurrence UNLESS one does a backwards eval on it.

One does one of these "backwards evals" without any situation in mind. In other words, one does not have to have a sit in order to start the eval. (And you are aware of course that most evals begin because a sit leaps up and has to be handled.) So, without a sit, one simply puts down the ideal scene one is hopeful of achieving. Then he finds the most glaring departure from the ideal scene. That is his sit. And he also may find as he works that he gets several sits and several versions of the principal ideal scene which in turn become THE ideal scene he had in mind in the first place.

There is a simple view of it: Just set the ideal scene, find the furthest departure from it, use that as the sit and then, gathering data and doing a regular eval, he will find WHY that ideal scene hasn't occurred or won't occur, then he can realistically program it to handle and the ideal scene WILL occur if the program is done.

One can take the more complex view of it: One sets the ideal scene, finds the furthest departure from it, follows a data trail, discovers there is more than one sit and so has a multiple-sit eval, each one with a different version of the ideal scene but these ideal scenes adding up to his original concept of the ideal scene.

Let us take a simple example. The major purpose of a directive to a salesman is "Sell the ballpark." Now, if we simply told him to do that, we would be relying on his charm and luck and while these might be quite good we are likely to get a failed salesman. A more sensible approach would be to convert that major purpose to the ideal scene of "The ballpark sold at a profit." Then find and take the widest departure from that ideal scene which possibly is "We have been trying to sell the ballpark for two years with no takers." Then we employ the standard steps of the Data Series and find the real Why, which could be "Nobody ever compiled a list of the people who buy ballparks or approached them." And we do a program based on the Why and ideal scene and THEN we can give the salesman that program and that major target and BANG, we sell the ballpark at a profit. As it could have been any one of a thousand Whys, we could have gotten a thousand different programs, all of which would probably have failed BECAUSE no evaluation was done.

So do not send to find why missions fail or projects collapse. Just notice that one didn't take what was desired and make it into an ideal scene and evaluate it backwards.

To always need a catastrophic sit in order to evaluate is to ask for more and more sits to occur as it is sort of an outpoint–correct but by evaluation. Of course, when sits exist, it is vital to evaluate them. But realize also that when you don't see what you consider an ideal scene, you can simply set it and evaluate back from it as above.

And realize, too, that this is a great way to make dreams come true.

EXECUTION OF EVALUATIONS

It is hereafter mandatory that every eval must carry in the policy section the following statement:

> Nothing in this eval may be interpreted to violate or alter or change HCO PLs or HCOBs. Anyone executing a target in this eval in such a way as to violate or alter any HCO PL or HCOB will be actionable by Comm Ev. Any recommendation in this eval for change of policy or tech must be cleared by the Watchdog Committee (WDC) before being placed in the eval as a target and resulting PL or bulletin must be reviewed by the Founder personally. All data or handlings where they refer to policy or bulletins must give the policy or bulletin number and its location and text verbatim.

Any violation of this policy will be actionable by Comm Ev. This policy is retroactive to all published evals whether they are remimeoed or not.

WHY THINGS ARE EVALUATED

A great mistake can be made if one assumes he has to evaluate everything before he can act. No way! One has to understand *why* things are evaluated.

Things are evaluated when they have to be corrected.

When one is building something based on tech and experience, one simply programs it and does it. That's it, simple as that.

One builds a car to fill the lack of cars. That is the sit. The Why is simply that one is not building so there are none. So one builds the cars.

Only when the car does not get driven or worse, does not sell, does one EVALUATE for blood.

If evaluation is used to delay putting something there or getting something done (just plain putting it there and forcing it to run) then you get a misuse of evaluation.

You don't have to evaluate to get a gang of men to move iron pipe. You get a gang, you tell them to move it. If they do it too slowly, you tell them to move it faster.

Where is the evaluation? Sit: Iron pipe needs moving. Program: Move it!

When one can't confront handling something, he can say, "I have to evaluate this situation," take six months and no iron pipes get moved!

Imagine a sergeant on the battlefield with the enemy in his teeth saying to himself, "I cannot tell my men to shoot for I have not had an okay on an evaluation." You get defeated troops.

Now when this sergeant, seeing the enemy charge, issues a silly order like "Dig latrines," one can also say he did not evaluate. But I wouldn't. I'd say he didn't have good sense.

So don't use "evaluation" (a *very* valuable tool) to avoid telling people to do their jobs. And don't buy that you have to evaluate everything before you can act.

Why do you evaluate? You evaluate when you've got some situation which is nonroutine and doesn't resolve and doesn't resolve to a debug.

Why do you debug something? You debug something when it doesn't move along as expected or when it doesn't move along at an expected rate.

The normal way of going about things is to program.

When something isn't running along as expected, you debug it.

When something won't resolve to a debug, when something is consistently bogged, you evaluate.

You can get slowed like mad in trying to handle something if you don't have these straight.

THE STAGES OF ANALYSIS

Occasionally one sees "stat analyses" which deal mainly in substantive information which is already known. Such "analyses" do not exclusively approach stats as stats. When done this way they are commentaries on what the person doing them hopes to do and handlings rather than a stat analysis.

A manager or a management unit actually cripples itself when it does not do a stat analysis exactly by the stats. A management echelon can get so wrapped up in programs that it doesn't view the right now of the scene. What's being omitted is an actual stat analysis of the overall scene for which that manager or management group is responsible, and as a consequence huge situations can go on undetected. One must do a weekly stat analysis of the scene based solely and totally on stats, quite in addition to ongoing actions. Without a standard stat analysis one can go adrift and separate from the reality of the activity.

There are actually three distinct types of data or action concerning it.

1. Substantive information gained from observation and missions and so forth — this is the continuous flow of information that comes in to a management area as, if it is on the ball and has its comm lines open, it gathers a lot of general running information.

2. Stat analysis — this deals exclusively in stats, their comparison and expectancies: With it you can spot right in on what is right and what is wrong with orgs or activities.

3. Data evaluation — this puts (1) and (2) together and from it one gets conclusions, but more importantly, carried to full evaluation, one gets the reasons why things are going up or going down.

A manager may sometimes tend to commingle all three levels and not do a pure stat analysis. Of course one should do all three above, but one should not fall into the habit of calling something a "stat analysis" which is flavored with (1) and (3) above.

A stat analysis is a sort of purity all in itself: It tells one where to look and alerts one to success or failures of ongoing activities and without a *pure* stat analysis one cannot then intelligently handle (1) above and cannot confirm (3) above. Stat analysis is the core of management, somewhat like the meters on the dash panel of a car one is driving. Stats tell you (providing they are correctly worded and assigned and if they are correctly reported) the *reality* of the scene. And one can even spot false or incorrectly worded or assigned stats.

Skill in doing a pure stat analysis, uncolored by (1) and (3) above is vital to an exec. It can be acquired. And really must be.

Stat analyses verify or dispute (1) above. Where an exec issues *any* order at all he is actually doing a bit of (3) above.

If he cannot do (2) above he will find himself wrong targeting, issuing needless orders and inevitably will mess up no matter how well intentioned or clever he may be.

I run by graphs and *that* is the secret of how I can spot things while a long way away with a minimum of data.

Graphs and stat analysis are the heart and soul of management.

DATA SERIES 51
O/Ws AND EVALUATION

Refs:

HCO PL	12 June 72R Rev. 24.6.88	Data Series 26 Esto Series 18 LENGTH OF TIME TO EVALUATE
HCOB	3 Feb. 79 II	CONFRONT TECH HAS TO BE PART OF THE TR CHECKSHEET
HCOB	2 Mar. 84RA Rev. 12.8.96	O/W WRITE–UPS

Vital data has turned up on people who cannot evaluate an area. It has been proven conclusively that when this occurs, they have overts and withholds concerning the area. When these are cleaned up, it has been proven they can evaluate the area.

Cleaning up evaluators of their overts and withholds in the subject area being evaluated can unjam this problem, not only of making evaluators but also debugging slow or no evaluations.

THEORY

O/Ws prevent confront; where one can't confront, they can't evaluate.

It has been revealed that the withhold is the onset of complexity and that it is capable of keeping a person from thinking. An evaluator must start thinking about the withhold in some reactive way, instead of thinking about the evaluation. He may not even realize that he had the withhold. This is quite a complex scene which brings to light the fact that the withhold makes a person incapable of being logical and that it is probably withholds that make man so complex. So there may be an entrance point here on simplicity–complexity because boy, can people with withholds get complex.

HANDLING

O/Ws on the subject area of the evaluation prevent the evaluator from evaluating. This is the operating tech. Following that is the evaluator can be illiterate.

It is vivid that failed evaluators have overts and withholds in abundance. This gives one a method and handling not only for evaluators but also students.

The handling is to get them to write up their overts and withholds on the area they are trying to evaluate, or any related area and get them meter-checked for completeness.

The procedure is as follows:

a. Get the evaluator to write up his or her overts and withholds on the area they are trying to evaluate or any related area.

b. Get him or her meter-checked for completeness.

c. Once finished with step (b), the evaluator is then crammed on the errors made in the evaluation.

d. When the cramming is complete, the evaluation is properly done.

For example, an evaluator received numerous rejects on an evaluation regarding an org's premises and its Estates Branch. He had proposed off-policy actions and his Ethics Why was a situation. He wrote up his overts and withholds on all Estates matters, buildings, etc., then received cramming on the evaluation so it could be properly done.

REMEDIES AND CAUTIONS

1. *Incorrectly administered O/W write-ups:*

If an evaluator doing this action bogs, falls on his head, refuses to continue to write up his O/Ws, etc., he is to get repaired at once by a qualified auditor using a Confessional Repair List. Where people are refusing to write up their O/Ws, either they are being invalidated in the O/Ws they write up, or they are not being correctly metered and some sort of an O/W correction list would have to be done on each of them.

2. *Cramming and overts:*

Cramming would not do any good up against overts. When the indicators of O/Ws on the subject are present as described earlier in this policy letter, the Cramming Officer would first require that the evaluator write up his O/Ws per the procedure given above *before* cramming.

3. *Additional corrective tools:*

There can be other factors that slow or stall an evaluator from completing an evaluation. Cramming Officers, C/Ses and executives have a number of other tools available to handle a bugged evaluator, such as application of HCO PL 12 June 72R, LENGTH OF TIME TO EVALUATE, HC Lists, all methods of Word Clearing, Crashing Mis-U Finding, False Data Stripping and so on.

These corrective actions can and should be done when warranted in order to get an evaluator rapidly completing standard evaluations.

SUMMARY

O/Ws prevent evaluation. This is a real breakthrough on the subject of evaluation. Use it to make evaluators who are so slick and clean they shine in evaluation form.

PERSONNEL SERIES 1

PERSONNEL TRANSFERS CAN DESTROY AN ORG

It is an observation that Personnel, by critical definition, is "that function which creates havoc in one place in an org by trying to solve a personnel mess in another."

Example: We have just gotten in our Div 6. It has two people. The org has been suffering for lack of Div 6 actions. Now we've finally got two people there and they are being trained up. Meanwhile there is a shortage of staff in CF. Personnel "solves" the CF problem by transferring those in Div 6 to CF in Div 2. There goes any progress on Div 6.

By solving one problem, another is created.

Also there is the fact that it takes a while to train someone on a post and get the post in order. So rapid transfers defeat any post training or competence.

We call this action "musical chairs." That is a game in which people rapidly change positions.

So these transfers defeat not only the org on the third dynamic but also the individual on the first dynamic.

An earlier action similar to this went on. Then whenever Tech got an auditor trained up, Personnel would transfer the auditor to an admin post.

As the auditor was *tech* trained and not OEC trained, you began to find auditors in charge but they didn't have any admin training, thus shattering, by ignorance, the org form and defeating the org's production.

I've just seen a case where a staff member went on full-time training Class VI (very expensive) and was made HCO ES on his return. *But* had never had an OEC.

Using the Tech Divs as a "personnel pool" and taking tech people for admin posts thus defeats twice — defeats the org as a producing activity and defeats its form by not training people in admin (OEC) when they are going to be used in admin.

These personnel errors (or crimes) cause every staff member to suffer in terms of lowered income, lowered pay, lowered facilities, lower success. I doubt there is any org where these errors (or crimes) are not current at this writing.

To give the HCO ES candidate full-time training on the OEC or FEBC would make sense. Not Class VI! If you reverse it, you'll see what I mean: we give a new staff member an OEC only and put him onto auditing. Of course that would be disastrous. It's just as disastrous the other way around — taking an auditor who is a Class VI but not an OEC grad and making him the HCO Area Sec!

There is an optimum executive who is *both* an experienced, trained administrator (OEC and time on org posts) and an auditor. But an org would have to be in high production with *lots* of auditors before *that* could happen.

ERRORS

These errors are of long duration. They happen over and over. And they do more to destroy an org than any other action.

A. Making a hole in one place to remedy a hole in another.

B. Training a person for tech but not admin and putting him in admin.

C. Using the Tech Divs as personnel pools from which to man other divs.

D. Rapid shifts of post.

E. Leaving areas in an org unmanned.

SOLUTIONS

The reason why these things are done all come under the heading of failures to recruit and properly train.

Org expansion often gets pinned by false economy in personnel. "If we hired anyone else, we would get less pay." This completely overlooks the fact that if the org doesn't hire more people it will go broke. An org has to be of a certain size to be solvent; it has certain basic expenses such as rent which makes it cost just so much to run. Yet personnel can be so poorly thought out that the org is kept at starvation level.

I heard one not long ago which takes a prize, "But we don't need an Advance Registrar. We can't afford one anyway. You see we have pcs booked in advance for ten weeks already as we don't have enough auditors so why should we have any further promotion?" An idiot smile went with this of course. Backlog became "advance registration."

Orgs in various ways fix their income and prevent its increase. First and foremost of these is personnel.

In every org where I have acted as Executive Director, I have had a personnel procurement problem. In each case the problem was *internally* created. First I would get, "Well, units are low . . ." or "Nobody ever applies." I would take it from there.

I finally became very clever at these impasses. "What," I would ask the Receptionist, "do you tell people who come looking for a job?" Cunning. "Oh them!" I would get, "I tell them we aren't hiring, of course." I would set up a line from a specially appointed Personnel person to me only and would shortly have enough people. I have run an org from 8 people to 63 in 30 days and its GI from £50 to £3,000 in 60 days. Just by doing the usual. It created *awful* problems of course, like auditing rooms, classrooms, hand grooving people onto posts — it was busy. The favorite graveyard calm, so adored there before that, got shattered to hell!

I concluded many times then and conclude now that it is a characteristic of an org to refuse new personnel and to keep them off. In approaching this problem in an org, I am afraid experience has taught me to begin with that assumption and handle it from that viewpoint.

So I normally set up a line that can't be stopped and get people on post. Then I force in training on posts. And I personally inspect and talk to every section every day about what they need and how it's going and keep up their section production.

LRH Comms tell me they *can't* get execs to inspect their areas daily. And personnel shortages show that others do not blow the lines open on recruiting and even prevent handling.

So here is one area where I do some things in managing a production org that not many others do:

1. Force recruitment.
2. Train on post.
3. Daily inspection and comm with everyone in the place in his post area.
4. Concentrate on section and individual production.
5. Let people finish the job they are on.

The result of all this has uniformly been sky-high stats, sky-high pay, huge reserves and excellent tech produced.

So these are the magic solutions.

I do NOT empty out tech to fill admin. I do NOT encourage transfers. I do NOT create problems in one area by transferring to another. I will NOT accept that no one applies for jobs. And I don't wreck one project by grabbing people off it to start another. I FIND NEW PEOPLE.

IMPOSSIBILITIES

Behind every "impossibility" lies some great big WHY which if not found, keeps things messed up. One area that "couldn't get any auditors" had expelled 60 percent of the field from the Church! Another area had dismissed 50 percent of staff every time the income dropped. Another area cut the staff's pay very low and then made it go lower each time the gross income fell. Another "never could find the right people."

Sometimes internal squabbles are given a much higher importance than the org itself.

Some areas use "social acceptability" instead of stats to handle personnel.

Whatever the reason an org isn't getting on, it is *internal*. It isn't some other org or some senior management body. It's right inside that org. Further it has to do with personnel mishandling.

Any org at any time has *not* given as much quantity of service as the public demanded. If you continued to expand at the rate of demand, giving very high quality of service mind you, the org would expand to hundreds or even thousands of staff members.

Somewhere, when that doesn't happen, personnel mishandling has cut off the expansion.

So when we look this over, we find that quality of delivered product determines how much it will be in demand and that the only thing which will limit an expansion to meet that demand is personnel procurement, training and stability on post, getting the staff to produce and holding the form of the org and making it go.

When personnel commits the errors (or crimes) mentioned here and when management fails to do the (1) to (5) listed above that I do in an org, there will be a halt.

True, an org is complex. True, quality is hard to maintain. True, one has to work. But unless personnel procurement and handling is IN, all else will fail. So that's the weak spot.

An undermanned division will empty.

An undermanned org will pay badly and go down.

The point to handle is personnel.

PERSONNEL SERIES 2

PERSONNEL PROGRAMING

If personnel are not programed, you get chaos.

The subject of personnel carries with it always the subjects of training and experience and suitability.

Dept 13 has been created to permit personnel to be "enhanced" or improved.

This is done by programing.

HCO should make known what it will need in the org in the next year. How many of what kind it now has.

Dept 13 must work out what programing is now needed. It posts a board, puts the names on it and sees that part-time study will occur and be followed for the *next* post. It sees that this will be made.

HCO by looking back over some period of expansion will be able to forecast what will be needed more easily. Anyone in the org is usually aware of the undermanned points that exist and the unfilled posts, as they get hit with them continually. So if HCO doesn't know what these points are by record, it is easy to do a survey.

With an inefficient HCO which has not recruited and programed, the org is already starting well behind the gate and is already howlingly undermanned and undertrained. Yet to solve all this by instantaneous transfers will unmock the lot.

The RIGHT way to do it is to:

1. Count up what you have.
2. Figure out where they will be promoted to.
3. Program them on part-time training and
4. Recruit.
5. When recruits are on, get them genned in fast on the lower posts so they can operate.

6. Shift the programed people to the posts for which they have been programed.

7. Begin to train up the recruits with part-time programing.

8. Recruit.

This does not mean you shift every post in the org. It does mean your more experienced people are the ones that go up.

Various rules go with this:

TRY TO KEEP TECH TRAINED PEOPLE IN TECH.

TRY TO TRAIN ADMIN PEOPLE FULLY FOR ADMIN.

There are ways to waste enough training time to crash your org. Train a person to Class VI, put him in Public Divs. Train up a PES and transfer him to tech training. All sorts of goofs can be made in programing, all of them costly to the org, all of them defeating the objects of Personnel Dept 1 and Enhancement Dept 13. One obvious way is to train somebody up with no contract or note. But the main one is not to program at all and just rattle around as a total effect.

Part of the action by Dept 1 is to beat down all the reasons why we can't hire anyone. I recently reviewed an area where personnel problems were desperate. Five to ten people a week were applying. Only one to two were "suitable," whatever that meant. That ratio is wrong. Eighty percent unsuitable? Ten percent maybe, not 80 percent.

The area Dept 13 has to beat down is arranging work so no part-time study can occur. Only about 20 percent of a staff won't study. Nearly 90 percent will handle their post if it's overloaded rather than study, which is okay. But putting somebody on Day *and* Foundation and putting one man on a 10,000 name Address Section to keep it up and in use are the usual reasons for no study time.

This comes together between Dept 1 and Dept 13 AND IS AN INDICATOR THAT DEPT 1 IS GOOFING ITS RECRUITING ACTIONS.

Dept 3, Inspections, or the Executive Secretaries or Secretaries can also foul up both Dept 1 and Dept 13. By not inspecting and not running on and by stats, these salt the org down with idling people. So you see Dept 22, let us say, with six people and no production while the Treasury Sec has to work every night to handle an undermanned Dept 8.

The answer is *stats,* honest stats for everyone.

You can get a situation where you have enough people in the whole org to run an org but a third are overloaded and the rest dev-ting around. That's where there is no stat watching and no daily area inspections or executive interest.

I know of one org that has 44 on staff doing the work and potential service load of about 75. Naturally they can't take time off to study so they can't be programed. *Yet* the stat situation is not watched or used nor is the place inspected so the production is about a 20 person org and no funds exist to pay 44 much less 75. The clue is that it's

all manned except for Tech! The customers are there in droves. They can't get service. So no pay.

It is silly situations like this that occur when personnel are not programed. Two years ago the above org did not train anyone, worked as a clinic and would not even audit staff. All its auditor contracts expired. HCO and the OES sat there in a fog and let it happen. There was no Dept 13 to program anyone.

So here is a new angle to the recruitment problem. HCO is faced with the vital necessity of recruiting trained auditors NOW. Yet at this writing hasn't even sent around a bulk mailing to ask field auditors to drop in.

DEPT 14

So this is where Dept 14 gets into the act. It is a problem in org correction. If even Qual is empty, it's all an OES function. The correct solution is to force recruitment of trained auditors, force recruitment of ordinary applicants and program it in Dept 13 to train up new auditors as well.

THE REMEDY

You should realize that no matter how rough the problem looks, it involves *recruitment* and *programing*. Instant transfers can utterly wreck an org. Yet inevitably "transfer!" is all you hear when a solution is required to org production failures.

I think this comes in from the world of "psychology." Maybe labor unions. If a man isn't doing well on a post, you transfer him. It assumes that each person has "aptitude." It never changes so you fit the post to the person by finding a new post. That's really nonsense. You can actually more profitably fit the person to the post.

Only when programing has failed (or doesn't exist) does one resort to transfers to solve personnel problems. Of course experienced, able people get promoted. But unless they are programed and trained, watch out! He was a fine CF clerk and a lousy Dissem Sec. Why? It *isn't* his personality. It's that nobody trained him to be a Dissem Sec. He wasn't programed.

It's cruel to promote a person and let the guy fall on his head.

Transferring because somebody doesn't do well is discipline, it is not "adapting people to jobs they can handle."

There is quite an awful jolt in losing one's post. Never think there isn't.

Promote–demote occurs when the person is not programed. Therefore the new Dept 13.

Therefore this Personnel Series.

PERSONNEL SERIES 3

RECRUIT IN EXCESS

I have always followed a doctrine of hiring or recruiting in excess.

There is a heavy turnover in personnel. There are many stresses in human society.

You lose people from all ranks, particularly toward the top. Early on, for instance, I never could keep a secretary. Because she'd been *my* secretary she could get a big-pay job (one of them $10,000 a year) from a bigwig. Or some young man had to marry her (and divorce her when she was no longer so glamorously placed). Anyway she *was* trained and had become an executive secretary. The only one I know of who didn't go UP had a commie husband making sure she went down.

So the higher they go:

A. The more altitude they have that has market value, and

B. The more stress that hits them and blows them apart.

This is true of auditors. You'll lose three times as many Class VIIIs as you lose Class VIs. You'll lose three times as many Class VIs as you do Class IVs. Etc. And you'll lose more auditors than you will admin people.

Therefore you have to be very careful indeed who you send for full-time, expensive technical training. You have to ask these questions:

A. Is the candidate a uniformly good HDC auditor?

B. Is the candidate scheduled for a technical post?

C. Is the candidate a fast study by record?

D. Is the candidate uninvolved with anti-Scientology or non-Scientology connections such as wife or family?

E. Is the candidate out of personal debt?

F. Does the candidate have a good record of keeping his promises?

G. Is the candidate willing to sign a new contract and note?

H. Have the candidate's stats been high on post or especially in auditing?

I. Does the candidate stay with the org and not go into a mission?

If the answer to all these is emphatically *yes* there is a chance that the org will benefit. If any of these are no, or if any are even maybe, then *don't do it.* Find somebody who *will* be able to get a YES on every one. They are more numerous than you suppose.

This is also true for highly specialized admin training. The same list, except for B (and is scheduled for an admin post and is a candidate for higher org admin training), applies rigorously.

Failing to establish these things first and getting it all understood, you can find yourself with all such funds expended and no highly trained personnel either.

LOSSES

The percentage of loss or incompetence discovered is hard to establish but is remarkably high. In the decade from 1960 to 1970 personnel turnover was quite heavy even in orgs that were booming.

During that time staff staff auditing was at a minimum. The orgs were jittery under psychiatric inspired attacks. Dianetic tech was not in use until mid-1969. From 1966 to 1970 Scientology tech was quickie and the Grade and Class Chart not followed. Pay after I ceased to be Executive Director was low. Therefore you can make a list of things that have to be in hand to reduce heavy turnover.

1. Audit staffs well and train them for staff status.
2. Keep PRO area control in in areas and in the org.
3. Use Dianetics heavily and teach it well.
4. Keep all Scientology tech materials in action with tapes and all materials and books in full use, well used, well taught.
5. Keep personal and sectional, departmental and divisional stats high.
6. Keep the org recruited up.
7. Keep personnel programed.
8. Hold the form of the org.
9. Deliver an excellent, flubless product.
10. Work for volume of training and processing as the org's product.

As recruitment was also neglected and as contracts expired without being filled, we can add:

11. Over-recruit always.

If you have an idea you will need 20 people in the next 6 months, you had better take on at least 40 and you will have your 20. And double is a low figure.

LINEAR RECRUITING

A firm hires a girl to write their letters. After 60 days they find she doesn't do her job. So they get rid of her and hire another. And in 90 days find she can't do her job. So they fire her and hire another. . . . That's 150 days of no correspondence. It's enough to ruin any firm. It's costly.

SIMULTANEOUS HIRING

A firm hires 3 girls feeling they need 1.

At the end of 150 days they have 1 girl.

But they had 150 days of correspondence. And a profit.

The economical answer in terms of saved profit is *keep up the production*. Don't fixate on personnel. Always do multiple personnel procurement.

In actual practice when you do this, you seldom fire anyone. They blow off or they were actually needed.

If people *are* let go, you don't just brush your hands of it. You in an organization can let them continue being programed while they hold an outside job, fix them up, get them trained and hire them later.

Modern society is *very* loose-footed. The state pays them not to work (apparently only). The society is suppressively oriented. The push and pull of personal relationships is poor.

You are edged in upon a society of dying cultural values, encroaching drugs, threatened annihilation.

No one out there feels very safe.

This insecurity leaks into the org and people get pushed around or push people around.

Real or fancied wrongs occur.

People are rather timid really.

And the more the society buys the idea it's a world of tooth and claw, the more it becomes so.

All this reflects into the picture of personnel.

You have to really work to keep orgs manned and trained up.

You do this by:

A. Running a very good org,

B. Delivering an excellent product,

C. Keeping a steady inflow of new personnel,

D. Training and processing well those you have.

If the (1) to (11) are in in the org then EXPANSION occurs and losing hardly anyone you have to scramble to keep up.

As the INCOME OF THE ORG DEPENDS WHOLLY ON ITS GDSes (Gross Divisional Statistics) and as these are wholly *under the control of the org,* then it's obvious that the only finance trouble or pay trouble an org can have is by undermanning, undertraining and underproducing.

No great international GI slump has ever occurred unless there has been a long GDS slump. So it's obvious that an undermanned org is asking for a cave-in.

Much of this has been learned in recent years.

At this writing there is little or no recruitment by HCOs and training of staffs could be better.

But the lessons we learn, we learn and apply.

And so it is with personnel.

PERSONNEL SERIES 4

RECRUITING ACTIONS

The first thing one has to handle in recruiting is the willingness of an org staff to have new people as staff members.

New people tend to cut pay down, they stretch internal staff services thinner, they are not yet "with it" and create a lot of dev-t. Ethics problems rise. Deadwood goes overlooked. Staffs have a certain esprit and élan and aren't all that willing to confer it.

Some orgs plug along on a fixed inadequate gross income, refusing to recruit, losing old staff by contract expiry or graduating to higher orgs or general wear and tear.

They have a sort of horror of green staff members. One can't blame them — files get upset, comms vanish, body interruptions go high, one gets overloaded just handling the dev-t generated.

BUT THERE IS A WAY TO HANDLE ALL THIS.

HCO PL 4 Jan. 66, PERSONNEL, STAFF STATUS, and Staff Status 0, I, II and III take care of these faults.

All this is programed in LRH ED 121 Int, 29 Aug. 70, STAFF TRAINING PGM No. 2, which is a part of this series.

Taking on new staff has to be done. Otherwise the org will not expand; that which stays the same shrinks and the org faces collapse.

So recruitment is a vital necessity.

To overcome any objections, one makes sure that HCO PL 4 Jan. 66, PERSONNEL, STAFF STATUS, is IN. Otherwise the place becomes a maelstrom. It is gotten in by the LRH ED, STAFF TRAINING PGM No. 2.

RECRUITING POOLS

HCO PL 24 June 70 II, PERSONNEL POOLS, lists proper personnel pools for a Dianetics or Scientology organization.

This covers areas for recruitment and gives ways to do it.

The main thing, the most important thing, is that IT HAS TO BE DONE. It doesn't just happen.

Any organization or activity has to recruit and it has to train.

The dream of the industrialist and even the modern agriculturalist is an activity which is totally automated (automatically run by machinery not people). The more "overpopulated" the world becomes, the more the bigwigs dream about automation. I had a psycho editor once (cured him of being psychotic but never cured him of being an editor) who used to dream up civilizations where the machines were even repaired by machines.

The lovely part of machines is that they are supposed to be invariable in action. Each part meshes smoothly with every other part.

If you conceive of a machine made out of human beings instead of metal parts, you see at once that the parts are not exact nor are they perfectly adapted to each other.

This is the fact about beings that dismays the industrialist. The parts don't fit, they vary, they have ideas of their own.

The "parts" also drop out of the "machine."

Any old-time personnel system seeks to fit the people into the "machine" composed of people or fit the "machine" to the people.

All these systems were based upon a psychological principle that no person ever changed or got better.

Also the idea was that people's social order as it existed was the basic social order. (That the existing departure from the ideal scene *was* the ideal scene. See the Data Series policy letters.)

Thus it was conceived that an organization composed of human beings required perfect human beings or it wouldn't run at all. But there are no perfect human beings.

In "straightening an organization up" there is a belief that one must get rid of all its imperfect beings.

And this can go so far as to refuse to try out or let in any beings who are not perfect.

When things get to this pass, one is looking at the probable death of an org.

In real life only a small percentage of people are "unsuitable." They come in four general classes:

a. Those who are destructively antisocial (suppressive persons).

b. Those who are connected with the destructively antisocial outside the org (potential trouble sources).

c. Those ill, diseased or in some way unable to function.

d. Those who are active enemies sent in by active enemies to harm the org.

Anyone hiring should be familiar with the HCOBs covering suppressive persons and HCOBs and policy letters concerning potential trouble sources.

He should also be familiar with testing procedures: (1) E-Meter tone arm position and needle manifestation (HCO PL 26 Aug. 65, ETHICS E-METER CHECK), (2) IQ tests, (3) Aptitude tests, (4) Leadership score, (5) Oxford Capacity Analysis, (6) The Chart of Human Evaluation (*Science of Survival*).

These skills and procedures are part of the Hubbard Consultant (HC) Checksheet.

Using this technology, one minimizes the entrance onto staff of persons who will upset the place.

If no reasonableness (faulty explanations) enters into this, the 10 percent who would enter disturbance into the place are eliminated.

If this barrier is put up and held up, then the people brought in on staff will not upset anything.

Following the Staff Status procedure, one grooves them in.

And all is well.

If this procedure is NOT followed rigorously, the org will become educated into resisting new staff or recruiting. The place will not smoothly expand.

BEGINNING HIRING

To begin a cycle of recruitment one must first apply all the test procedures to *all* on the existing staff and compare it to production records.

This is important. In one case where scores of green personnel were recruited, the place was *very* upset. The whole organization blamed the new recruits. BUT THE TROUBLE WAS COMING FROM THREE PERSONS ALREADY THERE — two were on drugs, the third was a suppressive of a classic kind and these three blocked all training and processing of the new recruits! The three eventually blew off, people got trained and processed and the whole org went upstat. There were no undesirables amongst the new people! They were just so battered around and left so untrained that they were made to look bad!

Any org which has lost a lot of staff and has failed to recruit had hidden in it someone who should have been screened out!

So one is looking for a small percentage. He is NOT trying to find perfect people!

With that small percentage screened out one can make recruits into valuable staff members.

Whenever I see “80 percent were unsuitable” I really raise an eyebrow. Wrong percentage. When I see “we dismissed 50 percent” I raise the other eyebrow. Wrong percentage. Ten percent yes. Fifty to 80 percent no.

So when I see figures like that, I know that the screening is taking place in the wrong area. Somebody already IN is blocking others out and getting rid of them.

The test is not PAST. The test is what the E-Meter reads (no questions, just what *is* the read). What's the IQ, Leadership, Aptitude and Oxford? Where does he sit on the Chart of Human Evaluation?

If that's all okay and the personnel is IN now, what's his stat of production? What's his study stat? What's his case gain?

And that handles that. Without much trouble. Without opinion. Without any oppression or threats.

THE CHARACTER OF MAN

You see, man is not a savage beast at all. He is rather timid. He is easily alarmed.

His symptoms of revenge grow out of his fears.

His basic nature is social, not antisocial. He is not an animal. He likes to communicate. He actually would like to be friends. Rebuffs and upsets and failures to understand him and efforts to harm him can make him hide under a mask of aggression. And this, when it gets too bad and is wrong, is apt to drive him crazy.

If he isn't crazy, he is decent and tries to do his best.

That he put a foot wrong is unimportant. Will he put his foot right? is all I ever care about.

Discipline and punishment and threats can go far too far and can upset him very badly rather than crowd him "into line."

When madmen are amongst him he responds badly, is upset and becomes turbulent. Protected, he acts well and behaves well and is constructive.

A lot of experience is talking. I've even made great crews out of people the government had made into convicts.

A very few have gone so wrong that only huge amounts of processing would ever repair. In *personnel* recruiting and training they have to be audited so long that they are only cases, not personnel. They cause upsets for too long a period before they are handled as cases to be trusted.

They are not even natively bad. They think they are psychiatrists or wolves or vultures or something. They are crazy and think they have to kill or destroy.

People closely connected to them are a bit psycho as they go into terror.

When any weeding out goes further than this, it is a bad mistake, upsets an organization, blows people off and is itself oppressive.

You have to realize that we have precision tools. If we lose them or don't use them we get into trouble.

For a long while the E-Meter as a personnel instrument was out of use in the test battery. The Chart of Human Evaluation was laid aside. The Oxford Capacity Analysis was not used.

And personnel errors almost destroyed several orgs.

The tools we have tell the story well. They can be disregarded; opinion, police record, social acceptability, etc., get put into use instead and we are for it. Those are the OLD tools that failed.

But to use the tools we have, one has to realize they are precise tools. One doesn't get a bad needle on a personnel and explain it away. It's a bad needle (a rock slam or a dirty needle or a stuck needle or a stage four needle). It means we are dealing with dynamite.

We *can* handle it in processing. We *can* bring the person up to a valuable person IF WE ARE PROCESSING THE PERSON AS A PC.

But we are discussing *staff members*. We are discussing PRODUCTION. We are discussing hiring personnel.

Only about 10 percent fall into an unacceptable category. And they too can be saved. BUT WE DON'T WANT THEM AS PART OF AN ORG STAFF.

You see, there are two different things here. One is CASES. The other is PERSONNEL.

When a person knows he can handle offbeat cases, he tends to get careless about cases being offbeat as personnel. AND IT'S A NEAR FATAL ERROR.

It costs the org its calm, staff members their pay and deprives the area of full use of the product.

So it's quite an overt to overlook the niceties and technology of personnel and goof it up.

A very bad-off case on staff can actually cause enough trouble to blow off and bar out all good staff.

Bad recruits can make a whole org allergic to *any* recruits.

It's up to those in charge of Personnel to get trained as HCs and act accordingly.

HCO POLICY LETTER OF 10 SEPTEMBER 1970

REMIMEO

PERSONNEL SERIES 5

TRANSFERITIS

A survey of personnel on posts who would ordinarily be considered for transfer brings to light certain factors which underlie WHY they are failing on post even while seeming to work at it.

People on Personnel posts in companies have followed a nineteenth-century psychological approach that if a person can't do one post he can be transferred to another post to which he is better "adapted." "Talent," "native skill," all sorts of factors are given. But if a person with all things considered in the first place is then found to do badly on that post, the second think of nineteenth-century Personnel was to transfer him to another post and yet another and another. The third think when *again* he fails is then to fire him.

Transferring under these circumstances is usually not only wrong for the person but strews the error all through the org.

The HCO PL 24 June 70 I, MANAGEMENT CYCLE, gives an answer to "has to be transferred."

CAMOUFLAGED HOLES

A "camouflaged hole" means a hole in the org lineup that *appears* to be a post. Yet it isn't a held post because its duties are not being done. It is therefore a *hole* people and actions fall into without knowing it is there. It can literally drive an org mad to have a few of these around. *Camouflaged* means "disguised" or made to appear something else. In this case a hole in the lineup is camouflaged by the fact that somebody appears to be holding it who isn't.

Let's take a Receptionist who doesn't receive and route people. You will find the people in the org being fouled up by this. They all have to act *after* the fact of no-reception. This makes them handle reception in the midst of a mess of reception goofs. But there *appears* to be a Receptionist. If there were NO pretended-Receptionist, people would at least know this and keep an eye out. But as there "is a Receptionist" who isn't a Receptionist, all reception actions have to be handled by others each time *after* there has been a goof! Guaranteed to mess up the environment and strain tempers more than somewhat.

An executive post is much harder to detect. Those below it are not aware of the skills the post needs and are only aware of trouble. Yet it easily can be just a camouflaged hole.

Given the fact that one is not dealing with a sick person or a scoundrel (any post requires that a person be fairly healthy and with a clean ethics record), for a person to be on a post and not doing it, he or she must be suffering from one or more of the following conditions:

1. Never trained up for the post in the first place (per Management Chart),
2. Never grooved in on the post purpose,
3. Unreality or unfamiliarity with the ideal scene in its practical aspects, resulting in omitted data or a missing scene.

Furthermore, for a person to *remain* on a post under these conditions he/she must:

a. Be unaware of their lack of knowledge,

b. Blame it on another or

c. Have considerations about status (i.e., it would be damaging to their reputation for it to be found out that they didn't know).

This last point, status, puts any post flub onto a WITHHOLD basis resulting in continuously deteriorating performance each time it occurs.

In actual fact in each one of the cases examined, one or more of the above points were evident in greater or lesser degree. My suggested remedy would be:

1. *Thorough* training as deputy before putting any person on a major post. The purpose being to familiarize the person with actual working conditions.
2. A clear, approved statement of post purpose must be written in the front of the post hat write-up, which is easily comprehensible and simple. This post purpose is then cleared to F/N in Qual before the person can be considered fully on post.
3. Once on post the person must constantly maintain and increase their working knowledge of their appointed areas of responsibility and study and familiarize themselves with old and new HCOBs and PLs as they apply.

   That they undergo a competent examination from time to time on the duties and actions of their post as they exist or are extended.
4. That to this end any poor performance on post be reported to Div 5, Dept 13 for investigation and correction by examining the above points and putting in those found out.
5. That within the framework of Cases and Morale policy letter that priority be given to those posts in the org that most likely would be expected to collect a "status value" so that the integrity of those holding such posts be maintained.

6. That in any case, notwithstanding the above paragraph, persons on such posts should make every attempt to keep themselves clean of O/Ws, including making it known to the proper terminals when they find they have misunderstoods or missing data on post.

If there is any trouble in training a person up for a post, it will be traced ordinarily to LACK OF ADEQUATE MATERIAL about that post and no checksheet to be thoroughly checked out on.

This should be checked as a point.

It is common not to have a pack of data or checksheet for a post and, if so, one must be made.

SUMMARY

Given a person on post not producing, TRANSFER is almost never the right answer. Yet it is the one most frequently done.

If a person is morally unfit, a criminal or mad, it is obvious that "transfer" is the wrong answer.

So this leaves us with these actions to do:

As given in the Management Cycle, HCO PL 24 June 70 I.

HCO POLICY LETTER OF 12 SEPTEMBER 1970

REMIMEO

PERSONNEL SERIES 6

TRAINING

By actual test and practical experience, a fully trained, on-policy executive will raise the stats of an org.

An untrained executive will depress the stats.

An officer trained on the Flag Executive Briefing Course will send stats up where an equivalent officer not so trained will send them down.

This appears so obvious that it can be missed.

It means that it costs an org thousands upon thousands to use an untrained executive who has not done an FEBC. It costs personnel their pay, their facilities and their security.

If an FEBC cost $30,000 (which it does not), the org would make it back in a few weeks.

If an untrained executive is placed in charge of an org, it can prepare for losses and can succumb.

This is a very simple lesson. It is a matter of actual fact, not of PR.

This is shown up well when a fully trained executive is placed in charge of a whole org.

It is less visible but just as decisive regarding ANY post.

An untrained person on a post will be at best somebody not too destructive and at worst a camouflaged hole.

These facts are facts.

When you do not know this, be prepared to have lots of trouble, losses and dev-t.

It costs money not to spend money pretraining for a post. It also costs money not to train a person *on* a post to familiarize him with it.

Training is of course a relative word. The materials taught must be practical and useful and must apply to the job to be held.

Given this, a Personnel Officer who does not advise or provide for full prepost training will be found to be very costly.

One who insists on full pretraining and on-post training will be found to be a very valuable asset.

This data is *not* theoretical. It is the living truth.

PERSONNEL SERIES 7

HATS—VITAL DATA

I can prove conclusively and utterly that any down statistic traces at once to two points:

1. Failure to *hire* or recruit.

2. Failure to *train* people on their hats.

Regarding training, the failure of any executive is traceable to three points:

A. Not making up a checksheet for the posts of juniors under him.

B. Not making up a pack for the checksheet and a hat for each junior.

C. Not fully training his juniors up on their hats as per A & B.

To do all this an executive must himself be trained.

HAT — means the duties of a post. It comes from the fact that jobs are often distinguished by a type of hat as fireman, policeman, conductor, etc. Hence the term HAT.

A "hat" is really a folder containing the write-ups of past incumbents on a post plus a checksheet of all data relating to the post plus a pack of materials that cover the post.

One also has a "staff hat" which is to say a folder containing all his duties as a staff member, the org itself and its lines and purposes.

There is also a hat folder for general or technical directives issued to all the staff regardless of post.

So there is a:

Post Hat

Staff Hat

Tech Hat

for every staff member.

Before Personnel transfers and begins a musical-chair parade, it is well to inspect and see if:

a. the post has all these hats and knows them,

b. the post's senior has actively provided them and checked them out or had them checked out on the junior.

If (a) and (b) are not true then I can assure you Personnel will be replacing and musical-chairing forever.

It well may be that the executive is the trouble, not the incumbent.

A senior who does not see to full hats in the possession of juniors and does not see they are fully checked out is a liability.

ANY ORG'S TROUBLES CAN BE TRACED TO THESE TWO POINTS.

Therefore one must be very sure that seniors take responsibility for the hats, checksheets, packs and know-how of juniors.

A successful executive is one who understands:

1. Organization,

2. His own hat, has a checksheet and pack for it and knows these,

3. That he is at extreme risk if he does not enforce hat, checksheet and pack checkouts on his juniors.

ANYONE WHO HAS JUNIORS UNDER HIM IS A TRAINING OFFICER FOR THOSE JUNIORS AS A VITAL ADDITIONAL DUTY.

So really, Personnel, if you want to know who your executives are, find one who:

i. Has been trained,

ii. Who produces well himself,

iii. Who enforces hats, checksheets and packs on his juniors, and

iv. Trains his juniors as per (iii).

There you have an excellent executive, if not an Executive Director.

It is a cruel, vital, total truth that you normally can trace the reason for inefficient areas in an org or company to:

1. Lack of hiring or recruiting,

2. Lack of trained executives,

3. Lack of executives who will assemble hats for and train their juniors.

An organization is a third dynamic technology.

When the hats aren't known or worn, it's a mob.

A division which blows up or unmocks is usually:

1. Undermanned,

2. Unorganized,

3. Untrained.

Whenever a senior on the line of command fails to see to the hats and full training of his juniors you have a total breakdown.

Personnel sees this in terms of hiring and firing and transfers.

Look into any area that can't keep its people and you find not enough people or untrained people. And you for sure will also find an executive who WILL NOT train his people, see that they have post hats and checkouts.

The solutions are pretty obvious.

REMIMEO
PERSONNEL HATS
ETHICS HATS

PERSONNEL SERIES 8

ETHICS AND PERSONNEL

(Applies to E/Os)

Personnel can be harassed by utilization failures.

Demands *for* personnel are usually met by an inspection of the area (dept or div or activity) that is demanding the personnel.

A personnel demand received by Personnel is properly routed to the Ethics Officer with the following request:

"Dept (or activity) _____ is asking for personnel.

"Please check these points.

"A. Are existing personnel there busy? _____

"B. Have there been recent blows from that area? _____

"C. Are their MEST and comm lines in good condition? _____

"D. Do the personnel in that area each have HATS, FULL CHECKSHEETS FOR POST AND AREA? _____

"E. Does the senior officer of that area have and support a program for training and grooving in his personnel? _____

"F. Have the personnel now on post been ill (PTS)? _____

"G. Is there an SP in the area by meter check? _____

"H. Is study and auditing time arranged for? _____

"Please note by HCO PL 16 Sept. 70 I, ETHICS AND PERSONNEL, that if D and E above are out and no vigorous action is in progress to get these two points in, a Comm Ev should be convened.

"Please let me have a report on this area so that I can expedite needful personnel or demand utilization of existing personnel.

"Personnel I/C"

UTILIZATION

An area which does not make hats, checksheets and packs for its staff members and does not vigorously groove in and get personnel on purpose lines and knowledgeable will cause endless trouble for Personnel Recruitment Officers and Personnel Control Officers.

An area can get into this hideous cycle:

Recruit
Don't train
Don't groove in
Don't utilize
Apply heavy ethics
Lose personnel
Demand personnel
Don't train
Don't groove in
Don't utilize
Apply heavier ethics
Lose personnel

It will just keep on and on and on.

The staff member who goofs is NOT the proper Ethics target. The correct Ethics target is the divisional officer or department head who does not hat, checksheet and pack and train on them and groove in on post every personnel he has.

In some areas this failure is not sloth or "no time," but a solid great big WON'T TRAIN.

As the area subjected to this is downtone and poor imaged and overloaded, the job of recruitment is made nearly impossible.

PURPOSE AND CRIME

A breakthrough in the know-how of civilization is that a thetan evidently considers any beingness better than no beingness.

This would explain how people cling to an even painful existence and why even a slave or prisoner does not just drop a body.

Beingness is valuable.

A post or job is enormously valuable. Even the most minor post has a status value.

The only quality that is critical about a job is can it be held at all. By heavy overload and harassment a job can be made untenable. But a "blow" or departure is only occasioned by hope of a better one elsewhere in this same life. A workload can be heavy. But when it gets impossible, one gets a blow.

An overloaded division will empty.

The most common way to overload an area is to fail to hat, checksheet and pack the personnel and not train them. Then they work badly as a team with lots of friction as the jobs are not meshed with one another. Dev-t results. An apparency of hard work ends up in poor or little production.

Then personnel begin to make goofs which absorb the time of other personnel.

Not only this but A PERSONNEL WITHOUT PURPOSE CAN COMMIT CRIMES.

The secret of a turbulent society is contained in these facts.

A welfare state pays people not to work. It is paying to have people without purpose or hats. Therefore it gets crime. There is NO surer way to beget an insurgent society than to deny purpose and posts to its members.

Knowingly or unknowingly, welfare statism is aimed at disenfranchising citizens. From Rome on forward, every welfare state has eventually erupted in revolt and civil war. And every state which denied jobs or status has blown up in revolt. The French and Russian revolutions were fully concerned with breaking a monopoly of status.

However you view it or however it was done, FAILURE TO PROVIDE JOBS, PURPOSE AND TRAINING ON JOBS BEGETS REVOLT.

Unhappiness, social misery are not answered by denying in any way actual useful jobs.

The sense of belonging and purpose in living can be strangled in many ways.

Whenever it is done, it is done by some mechanism (like the dole or relief or plain unemployment) which prevents participation.

Participation is only achieved by the worthwhileness of the activity, the factualness and understanding of the activity, explained purpose and an exact and trained-in set of duties.

Crime stems totally and entirely from lack of belonging and understanding that to which one belongs. The criminal or juvenile gang is a substitute for society. It is an outlaw pack at the throat of that which forced it not to belong.

Preventing youthful participation, permitting airy-fairy education, unreal values and lack of understanding turns youth against the state.

Politicians and financiers have been too deficient in imagination to provide real jobs, real training, real objectives. It is easier to toss contemptuous starvation handouts to the multitude. Or lock them out entirely.

The wages of such action are revolt and social decline.

There is work and thought needful in providing:

A. A worthwhile cause,

B. Valuable production,

C. Jobs and status,

D. Real education for the posts held,

E. Perpetuation of a valuable activity.

Any businessman for various reasons tries to do this. He is usually overburdened by the state.

In Russia, where there is only the cynical state, police duress is all that holds the rickety framework together.

Thus there is a direct coordination between (a) social disorder and (b) no-job or no-hat or no-training on it.

ETHICS AND HATS

Wherever Ethics has to be heavy you find:

1. No real hats,

2. No checksheet or pack,

3. No thorough grooving in.

Given a worthwhile cause, Personnel can be made a near impossible post by neglect of grooving in.

When a person is unable to wear a hat, *processing* can trace back *the cycle of attaining status and losing it* until the person can have a hat.

Personnel placement is far less important than on-the-job hats, checksheets and packs grooved in.

Promotion follows any good production in due course.

This is how Ethics and Personnel work together or conflict.

If Ethics does not target those who fail to train rather than those who aren't trained or processed and goof or commit crimes, Ethics and Personnel both will come a resounding cropper.

In support of what I say, Ethics can trace any trouble in an area back to a failure to recruit and fully realistically train on posts.

And Personnel can trace any trouble in an area to past failures to recruit and fully realistically train on posts.

You have here in an org what has been destroying all of man's civilizations—denying jobs and status, failing to groove in and train. Man has only had force and Cossacks to remedy these lacks when what he really needed was imagination, jobs and training.

A full appreciation of this solves many riddles regarding social planning and societies.

In our own sphere we must use this understanding well and drive the social aberrations out of our orgs and keep them out by recruiting, hats, checksheets, packs and full training for every post and the sweeping removal of all blocks and barriers which prevent it.

A man wants to belong. He can't if he does not know the purpose of that to which he belongs and *all* the duties and actions of his post.

So make it so by recruiting, training and processing that he *can* belong and be valuable.

And by having upstat orgs, make it so the public can come in, get service and also belong by membership.

If you understand this fully, we can triumph for it is a know-how few other men have.

AN URGENT IMPORTANT AND STAR–RATE PL

PERSONNEL SERIES 9
ORG SERIES 4

HATS

HAT — A term used to describe the write-ups, checksheets and packs that outline the purposes, know-how and duties of a post. It exists in folders and packs and is trained in on the person on the post.

HAT TECHNOLOGY

"Hats" developed in 1950 for use in Dianetic orgs as a special technology. The term and idea of "a hat" comes from conductors or locomotive engineers, etc., each of whom wears a distinctive and different type of headgear. A "hat" therefore designates particular status and duties in an organization.

A "hat" is a specialty. It handles or controls certain particles in various actions and receives, changes and routes them.

A "hat" designates what terminal in the organization is represented and what the terminal handles and what flows the terminal directs.

Every hat has a product.

The product can be represented as a statistic.

Any job or position in the world *could* have its own hat. The reason things do not run well in a life, an org, a group, nation or the world is an absence of hats.

The reason why an org runs well when it does is hats.

Any protest of anyone against things not running right can be traced to lack of hats.

Any slump an org goes through can be traced directly and at once to an absence of one or more hats being worn.

HAT CONTENT

A hat must contain:

A. A *purpose* of the post.

B. Its relative position on the org bd.

C. A write-up of the post (done usually by people who have held it before relief and when so done it has no further authority than advice).

D. A checksheet of all the policy letters, bulletins, advices, manuals, books and drills applicable to the post. (As in a course checksheet.)

E. A full pack of the written materials or tapes of the checksheet plus any manuals of equipment or books.

F. A copy of the org bd of the portion of the org to which the post belongs.

G. A flow chart showing what particles are received by the post and what changes the post is expected to make in them and to where the post routes them.

H. The product of the post.

I. The statistic of the post, the statistic of the section, the statistic of the department and division to which the post belongs.

STAFF HAT

There is also a general staff hat.

This hat contains:

a. The overall purpose of the org, its aims, goals and products.

b. The privileges or rewards of a staff member such as auditing, training on post, general training availability, pay, vacations or leave, etc.

c. The penalties involved in nonproduction or abuse of post privileges or misuse of the post contracts.

d. The public relations responsibilities of a staff member.

e. The interpersonal relations amongst staff members including courtesy, cleanliness, attitudes to seniors and juniors, office etiquette, etc.

f. The MEST of posts generally, its papers, despatches, files, equipment.

g. The comm and transport system of the org.

GRADIENT SCALE OF HATS

A "gradient scale" means "a gradual increasing degree of something." A non-gradient scale would be telling someone to enter a skyscraper by a 32nd-story window.

Thus there is a gradient scale of organizing.

A key to this is found in the *Problems of Work*'s theory of confusion and the stable datum.

One in actual practice has to cope while organizing.

COPE means to handle whatever comes up. In the dictionary it means "to deal successfully with a difficult situation." We use it to mean "to handle any old way whatever comes up, to handle it successfully and somehow."

IF YOU *REMAIN* IN COPE, THE DEMAND TO COPE INCREASES.

In that you have the key to "exhausted executives" or staff members. You have why the president of the US ages about 20 years in one term of office as you can see by comparing dated photographs of past presidents. He is totally on cope. His government has an org board that looks like a pile of jackstraws. He has no hat. His staff have no hats. His government departments have no hat. The technologies of economics, law, business, politics, welfare, warfare, diplomacy have been neglected or lost (they *do* exist to some extent).

The guy is on total cope. And the post has been on total cope since it was created as an afterthought by the Constitutional Congress that began the post in the eighteenth century. Even what it says in US civics textbooks is not found in practice.

So "difficult situations" are the order of the day and are handled by special actions and appointments.

The people who *should* handle them haven't got real hats.

This is all catching up with the country at this writing to such a degree that the citizen cannot benefit from a stable society or social order. The country looks more like a war of insurgency.

In other words departures from hats has led into total cope and it is steadily worsening.

Any organization put in by one political party is knocked out by the next incumbent, and who could totally organize a country in 4 years? (The term of a president.)

Yet it is hanging together some way and some way meeting increasing demands and pressures.

I have stated this in a large example so that it can be seen in a smaller unit.

To handle this one would first have to want to straighten it out and then assemble the tech of admin to straighten it out. And then one would have to begin on a gradient scale of org bd and hats.

A cope sort of hat would be tossed-off orders to some other people on staff who have some title of some sort.

Along with this would be a posted org bd that has little to do with duties actually performed and used by a staff that doesn't know what it is.

One begins to move out of cope (as given in other series) by putting an org board together that labels posts and duties and getting people on them to handle the types of particles (bodies, mailings) of the org.

The next action would be brief write-ups of the posts and their duties and checking people out on them.

Actually if you only got to the middle of the last paragraph with an org the executives would remain in cope. So much know-how would be missing in the org's staff that every rough bit would shoot up to the executive for special handling. And that is *cope*.

Hats only in this far is not good enough as it still takes a genius to run the place.

The next gradient scale is to get the hat to contain:

i. The post write-up itself,

ii. The theory and practical necessary to run it.

This is done by a preparation of checksheets of data and a pack matching it for key posts.

Naturally the org bd now has to become more real and staff has to be checked out on it.

Then hats as post checksheets and packs are extended to the rest of the staff.

The mechanisms of training have to exist by this time.

Seniors have to be made responsible that every junior below them has a hat consisting of write-up, checksheet and pack.

Meanwhile one continues to cope.

Gradually, gradually staff begin to know (through checkouts) their hats.

New staff coming on are grooved in better.

Cope begins to diminish and the organization tends to smooth out.

Here and there competent handlings begin to show up brightly.

Now we find a new situation. With everyone throwing together checksheets and packs for staffs we find nonstandard checksheets. Some messenger has to do the full checksheet of the HCO Division pages and pages long. The HCO Sec has a checksheet with just 10 items on it.

So a central authority has to standardize post checksheets and survey and put in overlooked bits of data.

But that is way up the line. The org long since has become smooth and prosperous.

So that is the gradient scale of getting in hats.

EXPERTS

Here and there you find an area of special expertise in an org where the expertise is so expert in itself that it obscures the fact that the person does not also have a full post hat.

A lawyer would be a case in point. It takes so long to learn law in some law school that an org executive can overlook the fact that the *post* hat is missing. Org policy on

legal matters and staff hat remain unknown to this legal post AND JAM IT UTTERLY. This came to light when a whole series of cases was being neglected because the legal staff member, an excellent lawyer, did not know how to make out a purchase order or that one could or should. Investigation found *no* post or staff hat. Only a legal degree.

Orgs continually do this with auditors. They are technical experts in *auditing*. So they get assigned to posts in the HGC WITH NO HAT. Backlogs occur, things goof up. Tech fails. All because it is overlooked that they are PART OF AN ORG and need staff and post hats and need to be trained on them.

Worse than that, a highly classed auditor is often put on an admin post without hat or training for it.

You would not take an admin trained person and without further training tell him to audit. So why take an auditor and tell him to handle an admin division?

Without his post write-up, checksheet and pack FOR THE POST and without training on it, the person just isn't qualified for it no matter what *other* line he is expert in.

It is great to have an expert who has been specially trained in some profession. But lawyer, engineer or public relations, he must have his hat for the *org* post and be trained on it or he will goof! Yet one won't suspect why that area is goofing because "he's a Class VI isn't he?"

UTILIZATION

Personnel can recruit madly, answering every frantic demand for personnel and yet HAVE THEM ALL WASTED for lack of full hats and full training on those hats.

An investigation of blows (desertions) from orgs shows that lack of a grooved-in hat was at the bottom of it.

People come on a job. It is at once a great mystery or an assumption of total know — one or the other.

Either one continued leads them into a state of liability to the org.

People who don't know what they are doing and people who don't but think they do are both NONUTILIZED PERSONNEL.

Pay and prosperity for the rest of the staff will go down unless this is remedied.

The whole org can sag and even vanish under these conditions.

So Personnel has a vested interest in hats being complete and staff trained on them. For Personnel people cannot possibly cope with "no pay so can't hire anyone" and "no people so can't produce."

The answer is H-A-T-S.

And a hat is a write-up, a checksheet and a pack.

And the staff member trained on them.

ETHICS

When a person has no hat he lacks purpose and value.

When he has no purpose and value he not only goofs, he will commit crimes.

It is apparently easier to hit with ethics than to program and give someone a full hat and get him trained on it.

Police action is not a substitute for having purpose and value.

This is so fundamental that one can even trace the unrest of a nation to lack of purpose and value. A huge welfare program guarantees crime and revolt because it gives handouts, not hats.

Even a field Scientologist should have a hat.

By doing only this over the world we would own the planet as in an expanding population individual purpose and value are the most vital and wanted commodities.

If there are no real hats there will soon be no money of any value and no bread!

SUMMARY

ANY HAT IS BETTER THAN NO HAT according to the way a thetan seems to think.

But be that as it may, the downfall of any org can be traced directly and instantly to no recruiting or no org board, no hats or unreal hats or no training on hats.

The sag of an org can be traced directly to lack of hats and lack of training on hats.

The overload of any post can be traced directly to lack of an org bd and lack of hats and no training on hats.

The way out is to organize the org board and hats while you cope.

If you do not, your cope will become an overwhelm. If you do, your burden will lighten and your prosperity increase.

It took 13 months of hard work and 20 years of org experience to learn that given a product lack of HATS was *the* WHY of departures from the ideal scene and that working toward providing full complete HATS was the way to get back toward the ideal scene.

REMIMEO

PERSONNEL SERIES 10

"MOONLIGHTING"

Staff members of an org who also have other jobs outside the org are said to be MOONLIGHTING.

Day staff with an evening or weekend job or Foundation staff with a day job have been accused unjustly in the past of injuring an org.

An org only gets injured when its doors get closed and it ceases to promote and deliver good service.

If a whole staff of a Day org decided to close the org all day and open it only in the evening, "moonlighting" would have destroyed the Day org. This would be heavily frowned upon.

If a Foundation staff closed the Foundation to get evening work, it would be a highly nonsurvival act and injurious.

An org which is just starting up or which has been so un-org boarded and unhatted that it fell into such a slump that staff could not live on its pay, the staff would be remiss not to moonlight while they built the org back up. Built up, org boarded and hatted, the org could pay its staff adequately.

To forbid the practice of moonlighting would be to force a staff member to blow in self-defense.

INFLATION

As money inflates (purchases less) and as the cost of operating rises and fees remain unchanged, an org can get into a situation where it is inefficient and pays low salaries.

"Moonlighting on the government" would be quite permissible. With governments anxious to hand out welfare, in some depressed area it would be quite all right to go on the dole or relief and work as a church volunteer in the org.

The higher unemployment rises, the less money will buy, the more finance trouble there is.

Org staffs under such duress can even live as monasteries for food, shelter and pocket money and keep an org going.

SUBSIDY

At this writing the only subsidies available from governments are for those who kill people. The money the government should be spending to support our orgs goes to special interest groups like psychiatry who pocket it and deliver nothing.

Up the years this may change.

Until it does we have to keep our heads up financially.

That also applies to an org staff member. There is no reason he should lose his staff job because he also has to moonlight to live.

A well-run, well-recruited, well-org boarded, well-hatted, well-trained org delivering high-quality training and auditing makes very adequate income and pays well. But it sometimes takes time to build up from a mismanaged slump to an ideal scene again.

There is no policy against MOONLIGHTING where it does not injure the org.

HCO POLICY LETTER OF 9 OCTOBER 1970

REMIMEO
PERSONNEL HATS
PR CHECKSHEETS

PERSONNEL SERIES 11
PR SERIES 4

THE PR PERSONALITY

A public relations personnel has to be spot on in:

a. Confronting,

b. Organizing,

c. Working.

CONFRONT

In confronting, a shy or retiring PR is not about to handle suppressive persons or situations. A PR must be able to stand up to and handle the more wild situations easily and with composure. When he does not, his confront blows and any sense of presentation or organization would go up in smoke. A PTS (potential trouble source) person or one who roller-coasters casewise or one who tends to retreat has no business in PR. His connections that make him PTS and his case would have to be handled fully before he could make good on PR lines.

ORGANIZE

In organizing, a PR has to be able not only to organize something well but to organize it faultlessly in a flash.

Every action a PR takes concerns groups and therefore has to be organized down to the finest detail; otherwise it will just be a mob scene and a very bad presentation.

A PR who can confront, can "think on his feet" and grasp and handle situations rapidly and who can organize in a flash will succeed as a PR.

WORK

The last essential ingredient of a PR is the ability to WORK.

When appointing people to PR training, the person's *work record* is very, very important.

The ability to address letters, push around files, haul furniture into place, handle towering stacks of admin in nothing flat are all PR requisites.

To be able to tear out to Poughkeepsie before lunch and set up the baby contest and build a scene for a press conference on catfish before two and get dressed, meet the governor by six is WORK. It takes sweat and push and energy.

A PR should be able to get out a trade paper in hours where an "editor" might take weeks.

The ability to work must be established in a potential PR before wasting any training time, as a PR who can't work fails every time.

DELUSORY REQUIREMENTS

People *think* a PR must be charming, brilliant, able to inspire, etc., etc.

These are fine if they exist. But they are actually secondary qualities in a PR.

Lack of the (a), (b), (c) qualities is why you see PRs begin to hit the bottle, get sick, fail.

If a PR is *also* charming, brilliant, able to inspire, he is a real winner. Possibly one is born with all these qualities every few generations.

Personnel in appointing and training PR must look for the wish to be a PR and (a), (b) and (c).

And anyone taking up PR who does so to escape hard work will fail as it IS hard work.

A real top PR wants to be one, has the abilities of (a), (b) and (c) and is trained hard and well in the subject. Then you have a real stat raiser, a real winner, a real empire builder.

REMIMEO

PERSONNEL SERIES 12
ORG SERIES 15
WORD CLEARING SERIES 18

ORGANIZATION MISUNDERSTOODS

By Scientology study technology, understanding ceases on going past a misunderstood word or concept.

If a person reading a text comes to the words "Felis domesticus" and doesn't know it simply means HOUSE CAT, the words which appear thereafter may become "meaningless," "uninteresting" and he may even become slightly unconscious, his awareness shutting down.

Example: "Wind the clock and put out the Felis domesticus and then call Algernon and tell him to wake you at 10:00 A.M.," read as an order by a person who didn't bother to find out that "Felis domesticus" means "house cat" or "the variety of cat which has been domesticated" will not register that he is supposed to call Algernon, will feel dopey or annoyed and probably won't remember he's supposed to wake up at 10:00 A.M.

In other words, when the person hit a misunderstood word, he ceased to understand and did not fully grasp or become aware of what followed after.

All this applies to a sentence, a book, a post or a whole organization.

Along the time track a crashing misunderstood will block off further ability to study or apply data. It will also block further understanding of an organization, its org board, an individual post or duties, and such misunderstoods can effectively prevent knowledge of or action on a post.

ALL THIS IS THE MOST COMMON CAUSE OF AN UNACCEPTABLE POST PRODUCT, OR NO PRODUCT AT ALL.

The difficulties of an organization in functioning or producing stem from this fact.

Personal aberration is the cause of products that are in fact overt acts.

Scientology technology today easily handles the personal aberration part of the problem, IF IT IS USED AND PROPERLY APPLIED. Leaving an org unaudited or being unable to figure out how to run a viable org so that it can afford to audit its staff members is asking for post or org products that are overt acts.

Employing persons of the Leipzig, Germany, death camp school (psychologists, psychiatrists) to handle personal aberration is like throwing ink in water to clean it up. Governments stupidly do this and wonder why their final product as an organization is riot, war and a polluted planet. The point is not how bad psychology and psychiatry are, but that one does have to *handle* personal aberration in an organization, and these schools were too vicious and incompetent to do so.

Those who are personally very aberrated are not about to produce anything but an overt act. They are difficult to detect as they are being careful not to be detected. Things "just sort of go wrong" around them, resulting in a product that is in fact an overt act. But these constitute only about ten or twenty percent of the population.

The remaining eighty percent or ninety percent where they are nonfunctional or bungling are so because they do not understand what it's all about. They have in effect gone on by a misunderstood such as what the org is supposed to do or the admin tech they use on their posts or where they are or what their product is.

Earth organizations like governments or big monopolies get a very bad repute because of these factors:

1. Personal aberration of a few undetected and unhandled,
2. Inadequate or unreal basic education technology and facilities.
3. Inadequate or unknown organization technology.
4. Noncomprehension of the individual regarding the activities of which he is a part.
5. Noncomprehension of the basic words with which he is working.
6. Purposes of the post uncleared.
7. Admin of the post not known or comprehended.
8. Technology in use not fully understood.
9. A lack of comprehension of products.

Out of these nine things one gets organizational troubles and the belief that it takes a genius to run one successfully. Yet all the genius in the world will fail eventually if the above nine things are not handled to some degree.

The common methods currently in use on the planet to handle these things are very crude and time-consuming as the items themselves are either dimly comprehended or not known at all.

1A. Personal aberration is met by torture, drugs or death when it is detected. Yet only the very serious cases who are obviously screaming, muttering or unconscious are singled out, whereas the dangerous ones are neither detected nor handled at all and become with ease generals or presidents or dictators, to say nothing of lesser fry. Ten percent to 20 percent of any organization is stark staring mad, doing the place in so adroitly that only their actual product betrays them.

2A. Basic education as well as higher general education has become a mass-produced area crawling with bad texts and noncomprehension and used mainly by hostile elements to overturn the state or pervert the race and its ideals.

3A. Organizational technology is so primitive as to change national maps and leading companies many times a century, an extremely unstable scene for a planet.

4A. Very few individuals on the planet have any concept of the structure of entities such as their country or state or company. Persons surveying the public in the US, pretending to advise acceptance of "new measures" already in the Constitution, were threatened for being revolutionaries. Hardly anyone knew the basic document of the nation's organization much less its rambling structure.

5A. The basic words of organization are glibly used but not generally comprehended, words like "company," "management," "policy." Vocabularies have to be increased before comprehension and communication occur and misunderstoods drop out.

6A. Post purposes are often glibly agreed with while something entirely different is done.

7A. Administrative actions involving posts are often only dimly comprehended and seldom well followed; but in this matter of communication, despatches, etc., the planet is not as deficient as in others except that these functions, being somewhat known, can become an end-all — tons of despatches, no actual product. In some areas it is an obsession, an endless paper chain, that is looked on as a legitimate product even when it leads to no production.

8A. The planet's technology is on the surface very complex and sophisticated but is so bad in actual fact that experts do not give the planet and its populations thirty years before the smoke and fumes will have eaten up the air cover and left an oxygenless world. (The converters like trees and grass which change carbon dioxide to oxygen are inadequate to replace the oxygen and are additionally being killed by air impurities coming out of factories and cities.) If the technology destroys the base where it is done — in this case the planet — it is not adequate and may even be destructive technology.

9A. The whole idea of "product" is not in use except in commercial industry where one has to have a car that sells or a washing machine that actually washes.

THE HARD ROAD

It is against this primitive background that one is trying to run an organization.

If it were not for improvements made on each one of these points, the task could be hopeless.

I have gone to some length to outline the lacks in order to show the points where one must concentrate in (a) putting an org together and (b) keeping it viable.

In these nine areas we are dealing with the heart of it in running orgs.

Enthusiasm is a vital ingredient. It soon goes dull when insufficient attention is paid to resolving and getting in these nine points.

Bluntly, if they are not gotten in and handled, the task of living and running a post or an org will become so confused that little or no production will occur and disasters will be frequent.

THE WORDS

The by no means complete list of words that have to be fully cleared and understood just to talk about organization as a subject, and to intelligently and happily work in an org EVEN AS ITS LOWEST EMPLOYEE is:

A company
A board of directors
Top management
Policy
Management
Programs
Targets
Orders
Technology
Know-how
Org bd
Post
Hat
Cope
Purposes
Organize
Duties
A checksheet
A checklist
A comm channel
A command channel
A relay point
A stable terminal
Double-hatted
A product
Aberration
VIABILITY

This is key vocabulary. One could draw up a whole dictionary for these things and no one studying it would be any wiser since it would become salted with other words of far less importance.

The way to do this list is sweat it out with a meter until one knows each can't mean anything else than what it does mean.

Out of a full understanding of what is implied by each, a brilliantly clean view is attained of the whole subject of organization, not as a fumble but as a crisp usable activity.

Unless one at least knows these words completely so that they can be used and applied, they will not buffer off confusions that enter into the activity.

Glibness won't do. For behind these words is the full structure of an activity that will survive and when the words aren't understood the rest can become foggy.

We *do* know all these needful things. We must communicate them and use them successfully.

HCO POLICY LETTER OF 6 DECEMBER 1970

REMIMEO
DEPT 14 HATS

PERSONNEL SERIES 13
ORG SERIES 18

THIRD DYNAMIC DE–ABERRATION

The exact mechanism of 3rd dynamic (group or organization) aberration is the conflict of COUNTER–POLICY.

Illegal policy set at unauthorized levels jams the actions of a group and IS responsible for the inactivity, nonproduction or lack of team spirit.

Counter-policy independently set jams the group together but inhibits its operation.

Out-reality on org bds, hats, etc., is to a large degree caused by disagreements and conflicts which are caused by illegal policy.

If we had a game going in which each player set his own rules, there would be no game. There would only be argument and conflict.

VARIETIES OF COUNTER–POLICY

At the start it must be assumed or effected that there is someone or some body to set authorized policy for the group. Absence of this function is an invitation to random policy and group conflict and disintegration. If such a person or body exists, new proposed policy must be referred to this person or body and issued, not set randomly at lower levels or by unauthorized persons.

Policies so set by the policy authority must be informed enough and wise enough to forward the group purpose and to obtain agreement. Ignorant or bad policy even when authorized tends to persuade group members to set their own random policy.

When no policy at all exists random policy occurs.

When policy exists but is not made known, random policy setting will occur.

Ignorance of policy, the need or function of it, can cause random policies.

Hidden not stated random policies can conflict.

Correct policy can be relayed on a cutative basis — a few words left off or a qualifying sentence dropped which makes policy incorrect or null. "Children may not go out" can be made out of "Children may not go out after midnight."

Altered policy can be limitless in error.

Attributing a self-set policy to the authorized source can disgrace all policy as well as pervert the leadership purpose.

Policy can be excluded from a zone of a group that should be governed by it. "Pipe-making policy does not apply to the *small* pipe shop."

Such masses of unnecessary policy can be issued that it cannot be assimilated.

Policy can exist in large amounts but not be subdivided into relevant subjects as is done in hat checksheets.

Disgrace of policy can occur in a subsequent catastrophe and render any policy disgraceful, encouraging self-set policy by each group member.

CLEARING A GROUP

All authorized policy must be set or made available in master books and adequate complete policy files. This makes it possible to compile hats and checksheets and issue packs.

Group surveys of "What policy are you operating on?" can reveal random policy.

All bugged (halted) projects can be surveyed for illegal policy and cleaned up and gotten going again.

Other actions can be taken all of which add up to:

1. Get existing policy used.
2. Get areas without policy crisply given policy from the authorized source.
3. Debug all past projects of false policy.
4. De-aberrate group members as per the Organization Misunderstoods PL and other materials.
5. Educate the group members concerning policy technology.
6. Set up systems that detect, isolate and report out-policy and get it corrected and properly set, issued and known.
7. Monitor any new policy against statistics and include policy outnesses as part of all statistical evaluations.

ADMIN SCALE

I have developed a scale for use which gives a sequence (and relative seniority) of subjects relating to organization.

GOALS
PURPOSES
POLICY
PLANS
PROGRAMS
PROJECTS
ORDERS
IDEAL SCENES
STATS
VALUABLE FINAL PRODUCTS

This scale is worked up and worked down UNTIL IT IS (EACH ITEM) IN FULL AGREEMENT WITH THE REMAINING ITEMS.

In short, for success, all these items in the scale must agree with all other items in the scale on the same subject.

Let us take "golf balls" as a subject for the scale. Then all these scale items must be in agreement with one another on the subject of golf balls. It is an interesting exercise.

The scale also applies in a destructive subject. Like "cockroaches."

When an item in the scale is *not* aligned with the other items, the project will be hindered if not fail.

The skill with which all these items in any activity are aligned and gotten into action is called MANAGEMENT.

Group members only become upset when one or more of these points are not aligned to the rest and at least some group agreement.

Groups appear slow, inefficient, unhappy, inactive or quarrelsome only when these items are not aligned, made known and coordinated.

Any activity can be improved by debugging or aligning this scale in relation to the group activity.

As out-reality breeds out-comm and out-affinity, it follows that unreal items on the scale (not aligned) produce ARC breaks, upsets and disaffection.

It then follows that when these scale items are well aligned with each other and the group there will be high reality, high communication and high affinity in the group.

Group mores aligned so and followed by the group gives one an ethical group and also establishes what will then be considered as overts and withholds in the group by group members.

This scale and its parts and ability to line them up are one of the most valuable tools of organization.

When orders are not complied with and projects do not come off, one should DETECT, ISOLATE and REPORT and handle or see that it is handled, any of the scale items found random or counter.

If any item below POLICY is in trouble — not moving — one can move upwards correcting these points, but certainly concentrating on a discovery of illegal or counter-policy. Rarely it occurs some old but legal policy needs to be adjusted. Far more commonly policy is being set by someone, verbally or in despatches, or hidden, that is bugging any item or items below the level of policy.

So the rule is that when things get messed up, jammed up, slowed or inactive or downright destructive (including a product as an overt act) one sniffs about for random or counter-policy illegally being set in one's own area or "out there."

Thus in the face of any outness one DETECTS — ISOLATES — REPORTS and handles or gets handled the out-policy.

The *detection* is easy. Things aren't moving or going right.

The isolation is of course a WHAT POLICY that must be found and WHO set it.

Reporting it would mean to HCO.

Handling it is also very easy and would be done in Qual.

This admin tech gives us our first 3rd dynamic de-aberrater that works easily and fast.

Why?

Well, look at the Admin Scale. *Policy* is just below *purpose*.

Purpose is senior to policy.

The person who is setting random or counter illegal policy is off group purpose. He is other-purposed to greater or lesser degree.

From 1960 to 1962 I developed a vast lot of technology about goals and purposes. If we define a goal as a whole track long long-term matter and a purpose as the lesser goal applying to specific activities or subjects we see clearly that if we clean up a person's purposes relating to the various activities in which he is involved and on the eight dynamics we will handle the obsession to set random or counter-policies!

So it is an auditing job and the tech for it is extensive. (The African ACC was devoted to this subject. Lots of data exists on it.)

It happens however that around 20 percent (probably more) of any group's members are actively if covertly antigroup and must be handled at a less profound level under "personal aberration" in the Org Misunderstoods policy letter before you can begin to touch purpose.

Thus any group member, since this tech remedy helps them all, would be handled with:

1. General case de-aberration (called L10s on Flag),

2. Purpose handling for posts,

3. Org bd, hatting and training.

Those setting random or counter-purpose later detected would get further no. 2 and no. 3.

As the universe is full of beings and one lives with them whether he likes it or not, it would be to anyone's interest to be able to have functioning groups.

The only way a group jams up and (a) becomes difficult to live in and (b) impossible to fully separate from is by random and counter-purposes.

If one thinks he can go off and be alone anywhere in this universe he is dreaming.

The first impulse of a hostile being is "to leave" a decent group. What a weird one.

The only reason he gets in jams is his inability to tolerate or handle others.

There's no road out for such a being except through.

Thus all we can do to survive even on the first dynamic is to know how to handle and be part of the third or fourth dynamic and clean it up.

Probably the reason this universe itself is considered by some as a trap is because their Admin Scale is out regarding it.

And the only reason this universe is sometimes a trial is because no one published its Admin Scale in the first place.

All this is very fundamental first dynamic tech and third dynamic tech.

It is the first true group technology that can fully de-aberrate and smooth out and free within the group every group member and the group itself.

Thus, combined with auditing tech, for the first time we can rely wholly on technology to improve and handle group members and the group itself toward desirable and achievable accomplishment with happiness and high morale.

Like any skill or technology it has to be known and done and continued in use to be effective.

The discovery, development and practical use of this data has made me very, very cheerful and confident and is doing the same thing on the test group.

I hope it does the same for you.

ORG SERIES 19

GROUP SANITY

The points of success and failure, the make and break items of an organization are:

1. HIRING
2. TRAINING
3. APPRENTICESHIPS
4. UTILIZATION
5. PRODUCTION
6. PROMOTION
7. SALES
8. DELIVERY
9. FINANCE
10. JUSTICE
11. MORALE

These eleven items MUST AGREE WITH AND BE IN LINE WITH THE ADMIN SCALE (HCO PL 6 Dec. 70, Pers Series 13, Org Series 18, THIRD DYNAMIC DE–ABERRATION).

Where these subjects are not well handled and where one or more of these are very out of line, the organization will suffer a third dynamic aberration.

This then is a SANITY SCALE for the third dynamic of a group.

The group will exhibit aberrated symptoms where one or more of these points are out.

The group will be sane to the degree that these points are in.

Internal stresses of magnitude begin to affect every member of the group in greater or lesser degree when one or more of these items are neglected or badly handled.

The society at large currently has the majority of these points out.

These elements become aberrated in the following ways:

1. HIRING

The society is running a massive can't-have on the subject of people. Automation and employment penalties demonstrate an effort to block out letting people in and giving them jobs. Confirming this is growing unemployment and fantastic sums for welfare — meaning relief. Fifty percent of America within the decade will be jobless due to the population explosion without a commensurate expansion in production. Yet production by US presidential decree is being cut back. War, birth control, are two of many methods used to reduce population. THIS THIRD DYNAMIC PSYCHOSIS IS A *REFUSAL TO* EMPLOY *PEOPLE*. EXCLUSION OF OTHERS IS THE BASIC CAUSE OF WAR AND INSANITY.

2. TRAINING

Education has fallen under the control of one-worlders, is less and less real. Data taught is being taught less well. Less data is being taught. School and college unrest reflect this. Confirmation is the deteriorated basic education found in teenagers such as writing. Older technologies are being lost in modern rewrites. THIS THIRD DYNAMIC PSYCHOSIS IS A *COVERT REFUSAL TO TRAIN*.

3. APPRENTICESHIPS

The most successful industries, activities and professions of earlier centuries were attained by training the person as an apprentice, permitting him to understudy the exact job he would hold for a long period before taking the post. Some European schools are seeking to revive this but on a general basis not as an apprentice system. A THIRD DYNAMIC PSYCHOSIS IS A *DENIAL OF* ADEQUATE *EXPERIENCE TO SUCCEED*.

4. UTILIZATION

In industries, governments and armed services as well as life itself, personnel are not utilized. A man trained for one thing is required to do something else. Or his training is not used. Or he is not used at all. A THIRD DYNAMIC PSYCHOSIS IS *FAILURE TO UTILIZE PEOPLE*.

5. PRODUCTION

Modern think is to reward downstats. A person is paid for not working. Governments who produce nothing employ the most people. Income tax and other current practices penalize production. Countries which produce little are given huge handouts. War which destroys attains the largest appropriations. A THIRD DYNAMIC PSYCHOSIS IS *TO PREVENT PRODUCTION*.

6. PROMOTION

Promotion activities are subverted to unworthy activities. True value is seldom promoted. What one is actually achieving gets small mention while other things are heavily promoted. Reality and PR are strangers. A THIRD DYNAMIC PSYCHOSIS IS *UNREAL OR NONFACTUAL PROMOTION*.

7. SALES

Sales actions are unreal or out of balance. Clumsy or nonfunctioning sales activities penalize producers and consumers. In areas of high demand, sales actions are negligible even when heavy advertising exists. This is proven by the inability to sell what is produced even in large countries so that production cutbacks are continual threats to economies and workers. A population goes half-fed in times of surplus goods. With curtailed car factories a nation drives old cars. With a cut-back construction industry people live in bad houses. Sales taxes are almost universal. A THIRD DYNAMIC PSYCHOSIS IS *THE IMPEDING OF PRODUCT DISTRIBUTION TO POTENTIAL CONSUMERS*.

8. DELIVERY

Failure to deliver what is offered is standard procedure for groups in the humanities. Commercially it is well in hand.

9. FINANCE

One's own experience in finance is adequate to demonstrate the difficulties made with money. A THIRD DYNAMIC PSYCHOSIS IS *THE PERVERSION OF FINANCE*.

10. JUSTICE

Under the name of justice, aberrated man accomplishes fantastic injustices. The upstat is hit, the downstat let go. Rumors are accepted as evidence. Police forces and power are used to ENFORCE the injustices contained in 1 to 9 above. Suppressive justice is used as an ineffectual but savage means of meeting situations actually caused by the earlier listed psychoses. When abuses on (1) to (9) make things go wrong, the social aberration then introduces suppressive injustices as an effort to cure. Revolt and war are magnified versions of injustices. Excess people — kill them off in a war. A THIRD DYNAMIC PSYCHOSIS IS *THE SUBSTITUTE OF VIOLENCE FOR REASON*.

11. MORALE

A continuous assault on public morale occurs in the press and other media. Happiness or any satisfaction with life is under continuous attack. Beliefs, idealism, purpose, dreams, are assaulted. INSANITY IS A REFUSAL TO ALLOW OTHERS TO BE, DO OR HAVE.

Any action which would lead to a higher morale has to be defended against the insane few. A THIRD DYNAMIC PSYCHOSIS IS *A DETESTATION OF HIGH MORALE*.

The COMMON DENOMINATOR of all these insanities is the desire to SUCCUMB.

Insanities have as their end product self or group destruction.

These eleven types of aberration gone mad are the main points through which any group SUCCUMBS.

THEREFORE, these eleven points kept sane guarantee a group's SURVIVAL.

EXAMPLES

Seeing all this in one example permits one to see that these third dynamic insanities combine to destroy.

A. Believing it impossible to obtain money or make it, a firm cannot hire enough people to produce. So has little to sell, which is badly promoted and is not sold so it has no money to hire people.

B. Needing people for another job the firm robs them from a plant which then collapses and fails to make money so no new people can be hired. This reduces production so people have to be dismissed as they can't be paid.

C. Persons are in the firm but are kept doing the wrong things so there is little production and no promotion or sales so there is no money to pay them so they are dismissed.

D. A new product is put in. People to make it are taken from the area already making a valuable product which then collapses that area and there is not enough money to promote and selling fails so people are dismissed.

The examples are many. They are these same eleven group insanities in play upon a group, a firm, a society.

SANITY

If this is a description of group aberration, then it gives the keys to sanity in a group.

1. HIRING

Letting people INTO the group at large is the key to every great movement and bettered culture on this planet. This was the new idea that made Buddhism the strongest civilizing influence the world has seen in terms of numbers and terrain. They did not exclude. Race, color, creed, were not made bars to membership in this great movement.

Politically the strongest country in the world was the United States, and it was weakened only by its efforts to exclude certain races or make them second-class citizens. Its greatest internal war (1861–65) was fought to settle this point and the weakness was not resolved even then.

The Catholic Church only began to fail when it began to exclude.

Thus *inclusion* is a major point in all great organizations.

The things which set a group or organization on a course of *ex*clusion are (a) the destructive impulses of about 10 or 15 percent of the society (lunacy) and (b) opposition by interests which consider themselves threatened by the group or organization's potential resulting in infiltration, (c) efforts to mimic the group's technology destructively and set up rival groups.

All these three things build up barriers that a group might thoughtlessly buy and act to remedy with no long-range plans to handle.

These stresses make a group edgy and combative. The organization then seeks to solve these three points by exclusion, whereas its growth depends wholly upon *in*clusion.

No one has ever solved these points successfully in the past because of lack of technology to solve them.

It all hinges on three points: (1) the sanity of the individual, (2) the worthwhileness of the group in terms of general area, planetary or universal survival and (3) the superiority of the group's organization tech and its use.

Just at this writing, the first point is solved conclusively in Scientology. Even hostile and destructive personalities wandering into the group can be solved and, due to the basic nature of man, made better for the benefit of themselves and others.

The worthwhileness of the organization is determined by the assistance given to general survival by the group's products and the actual factual delivery of those valid products.

The superiority of a group's admin tech and its application is at this current writing well covered in current developments.

Thus *in*clusion is almost fully attainable. The only ridges that build up are the short-term defense actions.

For instance, Scientology currently must fight back at the death camp organizations of psychiatry whose solution is a dead world, as proven by their actions in Germany before and during World War II. But we *must* keep in mind that we fully intend to reform and salvage even these opponents. We are seeking to *in*clude them in the general survival by forcing them to cease their nonsurvival practices and overcome their gruesome group past.

There are two major stages then of *in*cluding people — one is as paid organization personnel and one as unpaid personnel. BOTH are in essence being "hired." The pay differs. The wider majority receive the pay of personal peace and effectiveness and a better world.

The org which *ex*cludes its own field members will fail.

The payment to the org of money or the money payment to the staff member is an internal economy. Pay, the real pay, is a better personal survival and a world that can live.

Plans of INclusion are successful. They sometimes contain defense until we *can* include.

Even resistance to an org can be interpreted as a future inclusion by the org. Resistance or opposition is a common way point in the cycle of inclusion. In an organization where everyone wins eventually anyway the senselessness of resistance becomes apparent even to the most obtuse. Only those who oppose their own survival resist a survival producing organization.

Even in commercial companies the best organization with the best product usually finds competitors merging with it.

2. TRAINING

Basic training, hats, checksheets and packs MUST exist for every member of a group.

Criminal or antisocial conduct occurs where there is no hat.

Any type of membership or role or post in the whole organization or its field requires individual and team training. Only where you have a group member who will not or cannot bring himself to have and wear a hat will you have any trouble.

This is so true that it is the scope of Personal Enhancement.

Ask yourself "Who isn't trained on his post and hatted?" and you can answer "Who is causing the trouble?"

Basic training, slight or great, is vital for *every* member of a group, paid or unpaid.

A field auditor must have a hat. A student needs a student hat, etc., etc.

This requires training.

Training begins in childhood. Often it has to be reoriented.

Training as a group member must be done.

Training in exact technology or in the precise tech of admin is not the first stage of training. Basic training of group members, no matter how slight, must exist and be done.

Otherwise group members lack the basic points of agreement which make up the whole broad organization and its publics.

Training must be on real materials and must be rapid. The technology of how to train is expressed in speed of training.

The idea that it takes 12 years to make a mud pie maker is false. TIME in training does not determine quality of training. Amount of data learned that can be applied and skills successfully drilled determine training.

That the society currently stresses *time* is an aberrated factor.

The ability to learn and apply the data is the end product of training. Not old age.

The rate of training establishes to a marked degree the expansion factor of a group and influences the smoothness of the group during expansion.

If training is defined as making a person or team into a part of the group then processing is an influencing factor. The facilities for processing and quantity available are then a determining factor in group expansion.

3. APPRENTICESHIP

Training on post is a second stage of any training — and processing — action.

This is essentially a familiarization action.

To have a person leave a post and another take it over with no "apprenticeship" or groove-in can be quite fatal.

The deputy system is easily the best system. Every post is deputied for a greater or lesser period before the post is turned over and the appointment is made. When the deputy is totally familiar he becomes the person on the post.

Rapid expansion and economy on personnel tend to injure this step. Lack of it can be *very* destructive.

Optimally there should be one or two deputies for every key post at all times. This is a continual apprenticeship system.

Economically it has limitations. One has to weigh the *losses* in not doing it against the cost in doing it. It will be found that the losses are *far* greater than the cost, even though it increases personnel by at least a third for a given organization.

When an organization has neglected it as a system (and has turned over too many posts without deputy or apprenticeship action) its economics may decay to where it can never be done. This is almost a death rattle for an organization.

In a two-century-old highly successful industry, *only* the apprentice system was and is used (Oporto wine industry). The quality of the product is all that keeps the product going on the world market. If the quality decayed the industry would collapse. Apprenticeship as a total system maintains it.

Certainly every executive in an organization and every technical expert should have a deputy in training. Only then could quality of organization be maintained and quality of product guaranteed.

The total working organization should be on this system actually. And whenever a person is moved up off a post, the deputy taking over, a new deputy should be appointed. The last step (appointment of a new deputy) is the one that gets forgotten.

Failure to recruit new people over a period will very surely find the whole organization declining soon solely because there is no apprentice system of deputies. The organization expands, singles up the posts, promotes some unapprenticed people and begins to lose its economic advantage. Low pay ensues, people blow off and then no one can be hired. It's a silly cycle, really, as it is prevented easily enough by hiring enough soon enough when the org is still doing well.

The rule is DEPUTY EVERY POST AND NEWLY DEPUTY THEM WHEN PROMOTIONS OCCUR.

The most covert way to get around this is just to call each person's junior a deputy even though he has other duties. This makes it all look good on an org board. "Do you have each post deputied?" "Oh yes!" But the deputies are just juniors with posts of their own.

A deputy is *used* to run the same post as it is deputied for. This means a double posting pure and only.

You'd be amazed at how much production an executive post can achieve when it is also deputied and when the principal holder of the post will use the deputy and gen him in, not get him to cover an empty lower post.

4. UTILIZATION

People must be utilized.

Equipment must be utilized.

Space must be utilized.

Learning to USE is a very hard lesson for some. Untrained people, bad organization, poor machinery, inadequate space all tend to send one off utilization.

The rule is, if you've got it use it; if you can't use it get rid of it.

This most specifically applies to people. If you've got a man, use him; if you can't use him get him over to someone who can use him. If he isn't useful, process and train.

Anyone who can't figure out how to use people, equipment and spaces to obtain valuable final products is not worthy of the name of executive.

Reversely we get what an executive or foreman is — an executive or foreman is one who can obtain, train and use people, equipment and spaces to economically achieve valuable final products.

Some are very skilled in preparing people, systems, equipment, property and spaces to be used. But if these then go to someone who does not USE them you get a bad breakdown.

The welfare state and its inflation is a sad commentary on "executive ability."

An executive whose people are idle and whose materiel is decaying is a traitor to his people and the org, just that, for he will destroy them all.

UTILIZATION requires a knowledge of what the valuable final products are and how to make them.

Action which doesn't result in a final product that adds up to valuable final products is destructive, no matter how innocent it seems.

Man has a planet as a valuable final product. Improper *use* of the countries and seas, air and masses which compose it will wind up with the destruction of man, all life on it and the usefulness of the planet. So *proper* utilization of anything is a very real factor.

The nineteenth-century industrialist, like the mad kings who built great structures, used up men; they didn't properly use men.

And not using them at all, the current fad, is the most deadly of all.

UTILIZATION is a big subject. It applies to resources, capabilities and many other factors.

The question being asked in all cases is, "How can we USE this to economically obtain a valuable final product?"

Failing to answer that question gives one the "mysteries of life."

5. PRODUCTION

One may be prone to believe there is no sense in any production at all. Such a one would also be likely to say, "There is no sense at all." Or "If they keep on producing it will become impossible to destroy it all."

Production of some final valuable product is the chain of all production sequences.

Even the artist is producing a *reaction*. The reaction's service in a wider sphere to enforce it is what gives art its sense. A feeling of well-being or grandeur or light-heartedness are legitimate valuable final products, for instance.

The production areas and activities of an org that produce the valuable final products are the most important areas and activities of the org.

6. PROMOTION

The acceptance of valuable final products and of their value depends in a large degree upon (a) a real value and (b) a desire for them.

Promotion creates desire for the valuable final product.

The old saw that the man who builds a better mousetrap will have the whole world coming to his door is a total falsity.

Unless the value is made known, and the desire created, the mousetraps are going to go unsold.

Promotion is so important that it can stand alone. It can have limited success even when there is no product! But in that case it will be of short duration.

Promotion must contain reality and the final product must exist and be deliverable and delivered for promotion to be fully successful.

Public relations and advertising and all their skills cover this area of promotion.

7. SALES

It is hard to sell what isn't promoted and can't be delivered.

Economics greatly affect selling.

Anything must be sold for a price comparable to its value in the eyes of the purchaser.

COSTING is a precise art by which the total expenses of the organization administration and production must be adequately covered in the PRICING allowing for all losses and errors in delivery and adequate to produce a reserve.

PRICING (the amount being asked) cannot be done without some idea of the total cost of the final valuable product.

The sale price of one final valuable product may have to cover the cost of producing other products which are delivered without price.

PRICING however does not necessarily limit itself to only covering immediate cost of a product. A painting with a dollar's worth of paint and canvas may have a price of half a million dollars.

Also a painting used in promotion may cost two hundred dollars and be displayed at no cost at all to the beholder.

These relative factors also include the SKILL of the salesman himself and there is much technology involved in the act of selling something to someone and the world abounds in books on the subject.

Therefore sales (once promotion is done) are bound up really in COSTING, PRICING AND SELLING.

The value in the eye of the purchaser is monitored by the desire created in him for it. If this is also a real value and if delivery can occur then SELLING is made very easy — but it is still a skilled action.

The production of a valuable final product is often totally determined by whether or not it can be sold. And if it can be sold at a price greater than the cost of delivering it.

That it *gets* sold depends on the salesman.

The skill of the salesman is devoted to enhancing the desire and value in the eyes of the buyer and obtaining adequate payment.

8. DELIVERY

The subject and action of DELIVERY is the most susceptible to breakdown in any organization. Any flaw on the sequence of actions resulting in a valuable final product may deteriorate it or bar off final delivery.

There are many preparatory or hidden-from-public-view steps on a production line. When any of these break down, delivery is imperiled.

Given the raw materials and wherewithal to make some valuable final product, the valuable final product should occur.

WHEN A VALUABLE FINAL PRODUCT DOES NOT GET PRODUCED AND CANNOT BE DELIVERED, REPAIR THE EARLIER STEPS OF ITS PRODUCTION.

Example: An auditing result is not delivered. Don't just repair the pc. Repair training of auditors and C/Ses. Repair the assembly line *before* the valuable final product. The subproducts are less visible. Yet they add up to the valuable final product.

THE LAW OF THE IRREDUCIBLE MINIMUM occurs in all delivery problems. Someone is trying to produce only the visible end product of a post or production line and neglects the earlier contributory actions and products as these are not plainly visible.

When an organization or its posts operate only on an irreducible minimum, production goes bad and DELIVERY crashes.

Take a cook who has his post at an irreducible minimum. Food is appearing on the table. If he reduced just one bit more the food would no longer be edible at all. He neglects purchasing, menus and preparation. That these occur is invisible to the diners. That food appears on the table is visible to the diners. If the cook operates at any less level than he is, no edible food would be visible — hence, irreducible minimum. The food served will be bad. But it will be visible. Invisible-to-the-diners actions aren't being done.

To improve the food, get the less visible actions *done*. Get the sequence of actions all done. The result will be improved food.

Take training. The final valuable product is a trained auditor. The Course Supervisor who runs his post on an irreducible minimum is simply there, appearing to supervise.

His final product may be horribly unskilled. The teaching may take "forever."

To improve this one goes earlier on the assembly line — materials, packs, tapes, student tech services, recorder repair, scheduling — dozens of actions including getting the Course Supervisor trained.

The visibility is still a Course Supervisor and students being taught. But with the *whole* earlier line in, the final valuable product is excellent!

A being hopes lazily for instantaneous production. It doesn't happen this way in the MEST universe. Things are produced in a sequence of subproducts which result in a final valuable product. Hope all you want to. When you omit the subproducts you get no valuable final product.

When the people in an organization do not know the valuable final products of the org and when a person on a post does not know the final products of his post, a condition arises where no org DELIVERY will occur, or if it does occur it will be poor or costly. It is vital that a person knows what his post final products are and what his unit, section, department and division subproducts are and how his own and each of these contribute to the valuable final products of the organization for actual delivery to occur.

Delivering other than valuable final products or useless final products or final products that need constant correction also adds up to nondelivery.

A whole civilization can break down around the point of DELIVERY. So can an organization.

Since money can be looked upon as too valuable a final product it can actually prevent DELIVERY.

Failure to deliver is the one point beings do not forgive. The whole cycle hangs upon DELIVERY.

DELIVER WHAT IS PROMISED when it is expected, in sufficient volume and adequate quality is the first maxim even of a group in politics or the humanities.

9. FINANCE

Finance too often disregards the other factors in this scale or the other factors in this scale too often disregard finance for organizations to long remain viable.

Financing must be in agreement with all the other factors of this scale and all the other factors must be in agreement with finance for viability to occur.

Because money is interchangeable for commodities then people can confuse it with too many things.

If you regard money like so many beans, as a commodity in itself, you open the door to understanding it.

Money is so many beans in to get so many beans out.

When you can master this you can handle FINANCE.

The FINANCE persons of an org, a civilization, a planet should put so many beans in and expect more beans out than they put in. This is quite correct as a viewpoint for finance.

The difference of beans in and beans out for a planet is made up by adding beans enough to those already in existence to cover new commodity.

When finance people fail to do this beans cease to be in pace with production and inflation and deflation occur.

In an org or any of its parts, industriousness of the staff makes the difference between the beans in and beans out.

An org has to have income greater than outgo. That is the first rule of finance. Violating it brings bankruptcy.

Now if the FINANCE people of an org apply the same rule remorselessly to all *its* transactions (financial planning) with each person and part of an org, finance becomes real and manageable.

So many beans in to support the first division means so many beans out of the org back to finance because of the cooperative work of the first division.

A hectic effort to work only with production products will wind finance up in a knot.

One has to estimate (cost) the contribution of each part of an org to the valuable final product to know what to allow what part of an org.

Finance has to have a full reality on the valuable final products and the subproducts and post products of the whole org to intelligently allocate funds.

This person, that division, each contributes some part of the action that results in the money received for the valuable final products.

So finance can extend so much money for each and expect that and an additional amount back.

If this occurs, so will expansion.

Finance comes unstuck when it fails to "cost" an organization and fails to support valuable final product production.

Finance must not only practice "income greater than outgo" for the org, it must practice it for each part of the org as well.

Then solvency becomes real.

The greatest aberration of finance is that it seeks to *save* things into solvency. The real losses in an org are the sums never made. These are the most important losses for finance to concentrate upon.

An org that makes 500 pounds a week that should make 5,000 pounds a week in potential is losing the finance people 4,500 pounds a week!

Finance can force production along certain lines by putting in funds and getting more back.

Finance becomes too easily the management of an org but it only does that when it ceases to deal in its own commodity — money.

An org which has executives unfamiliar with finance will fall at once into the control of the finance people in the org. And these finance people, if they don't really know money, will fall at once under the control of outside finance people.

One has to know finance in any organization anywhere, even in a socialism. Sooner or later the books get balanced in any society.

10. JUSTICE

Without justice there can be no real organization.

Even a government owes its people an operating climate in which human transactions and business can occur.

Where insane and criminal individuals operate unchecked in the community, justice is uncertain and harsh.

The society in which the insane rise to positions of power becomes a nightmare.

Justice is a difficult subject. Man handles it badly.

INDEX

Justice cannot occur until insanity can be detected and cured.

The whole task of justice is to defend the honest man. Therefore the target of justice is the establishment of a sane society.

The inability to detect or cure the insane destroys civilizations.

Justice is an effort to bring equity and peace. When one cannot detect and cure insanity then sooner or later justice actions will become unjust and be used by the insane.

To us, justice is the action necessary to restrain the insane until they are cured. After that it would be only an action of seeing fair play is done.

11. MORALE

When all factors balance up in an org and give the group a common direction and mutual viability, morale can be expected to be good.

When the Admin Scale and the ten elements described are out of balance (without proper importance given to each) and when one or many of these (Admin Scale and the elements herein described) are not in agreement one with another, then morale will be poor.

Morale is not made of comfort and sloth. It is made of common purpose and obstacles overcome by the group.

When the Admin Scale and these elements are not held together by similar aims, then morale has to be held up artificially.

The most ghastly morale I have ever seen was amongst "the idle rich."

And the highest morale I've ever seen was amongst a furiously dedicated common-purposed group working under fantastic stresses with very little against almost hopeless odds.

I used to observe that morale in a combat unit would never materialize before they had been through hell together.

All drama aside, morale is made up of high purpose and mutual confidence. This comes from the Admin Scale items and these elements of organization being well aligned, one with the next, and honest sane endeavor to achieve a final goal for all.

ENVIRONMENTAL CONTROL

The differences between a competent person and an incompetent person are demonstrated in his environment (surroundings).

A person is either the effect of his environment or is able to have an effect upon his environment.

The nineteenth-century psychologist preached that man had to "adjust to his environment." This false datum helped begin a racial degeneration.

The truth is that man is as successful as he adjusts the environment to him.

Being competent means the ability to control and operate the things in the environment and the environment itself.

When you see things broken down around the mechanic who is responsible for them, he is plainly exhibiting his incompetence — which means his inability to control those things in his environment and adjust the environment for which he is responsible — motors.

When you see the mate's boats broken up, you know he does not have control of his environment.

Know-how, attention and the desire to be effective are all part of the ability to control the environment.

One's "standards" (the degree of rightness one is trying to establish and maintain) are directly related to one's desire to have a controlled environment.

The attainment of one's *standards* is not done by criticism (a human system). It is done by exerting control of one's environment and moving things effectively toward a more ideal scene.

Control of the environment begins with oneself — a good case state, a body that one keeps clean and functioning. This extends to one's own gear, his clothing, tools, equipment. It extends further to the things one is responsible for in the environment. Then it extends out into the whole environment, the people and the MEST.

One can get pretty dirty fixing things up. That's okay. But can one then also clean oneself up?

The ability to confront MEST is a high ability. After that comes the ability to handle and control it.

The ability to confront people is also a high ability. After that comes the ability to get along with them and to handle and control them.

There is the supreme test of a thetan — the ability to make things go right.

The reverse of this is the effort to make things go wrong.

Incompetence — lack of know-how, inability to control — makes things go wrong.

Given some know-how or picking it up by observation, sane people make things go right.

The insane remain ignorant intentionally or acquire know-how and make things go wrong.

Insane acts are *not* unintentional or done out of ignorance. They are intentional, they are not "unknowing dramatizations." So around insane people things go wrong.

One cannot tell the difference really between the sane and insane by behavior. One can tell the difference only by the product. The product of the sane is survival. The product of the insane is an overt act. As this is often masked by clever explanations, it is not given the attention it deserves. The pretended good product of the insane turns out to be an overt act.

A large percentage of this planet's population (undetermined at this time for the "general public" but in excess of 20 percent) are insane. Their behavior looks passable. But their product is an overt act. The popularity of war confirms this. The products of existing governments are mainly destructive. The final product of the human race will be a destroyed planet (a contaminated air cover rendering the planet unable to sustain life, whether by radiation or fumes).

Thus, due to the inability to detect and handle the insane, the sane majority suffers.

The hidden actions of the insane can destroy faster than an environment can be created UNLESS one has the know-how of the mind and life and the tech of admin and the ability and know-how to handle MEST.

An area or activity hit by an influx of new recruits or new customers tends to unsettle. Its MEST gets abuse, things go out of control.

Gradually, working to put in order, the standards are again being attained. The minority insane get handled, the know-how of groups and orgs becomes more generally known, the tech of MEST gets used again.

As an organization expands it goes through cycles of lowered condition and raised condition. This is normal enough since by taking on more and more area one is letting in more and more insane even though they are in a small proportion to the sane.

Order is reestablished and survival trends resumed to the degree that the sane begin to reach out and handle things around them and as the insane are made sane.

Thus one gets downtrends and uptrends. As soon as a group begins to feel cocky, it takes on more area. This includes more unhandled people, admin and MEST and a downtrend begins. Then the sane begin to handle and the insane begin to be sane and the uptrend starts.

This is probably even the basis of national economic booms and depressions.

This is only bad to the degree that the insane are put in charge. As soon as this happens the downtrend becomes permanent and cultural decay sets in.

A group expanding rapidly into a decadent culture is of course itself subjected to the uptrend–downtrend cycles and has to take very special measures to counteract the consequences of expansion in order to maintain any rate of growth.

The individual member of a group can measure his own progress by increased ability to handle himself, his post and environment and the degree of improvement of the group itself because of his own work within it.

A group that is messing up its gear and environment worse than it did a while ago and is not improving it of course has to be reorganized before it perishes.

No group can sit back and expect its high brass to be the only ones to carry the load. The group is composed of individual group members, not of high brass.

The survival of a group depends upon the ability of its individual members to control their environment and to insist that the other group members also control theirs.

This is the stuff of which survival is made.

A sane group, knowing and using their technologies of handling men and MEST, cannot help but control their environment.

But this depends upon the individual group member being sane, able to control his MEST and those around him and using the tech of life, the tech of admin, the tech of specific types of activity.

Such a group inevitably inherits the culture and its guidance.

HATS PROGRAM PITFALLS

The main outnesses about hats are:

1. Personnel having a hat and title but doing some *other* job or jobs.
2. Personnel falling between two divs or posts and being in neither.
3. Personnel having no hat at all.
4. Personnel unable to even cope because people around them don't have hats.
5. Hats matching an org board but the org board itself is disorganized.
6. Personnel holding a part-time hat but no other hat even though full time.
7. Hats lost in post turnovers and no complete hat file.
8. The only other copy in the hat file issued and *also* lost.
9. Org pattern changes which make hats unreal.
10. Juniors trying to wear their hats but a senior, being unaware of them, issuing different orders.
11. Seniors trying to wear their hats but juniors unaware of them and making different demands.
12. Personnel moving off not replaced, leaving others in the organization to carry a load for which they have no hat.
13. Missing ideal scene for hat.
14. Missing general ideal scene for division.
15. No concept of the scene at all.
16. A person just not doing his hat.
17. Checksheet and/or pack missing or incomplete for post.

18. Missing any part of full hat content per HCO PL 22 Sept. 70, Personnel Series 9, Org Series 4, HATS.

19. Hat checksheet contains (a) omissions (too short); (b) highly irrelevant data; (c) doesn't belong to the post.

20. Counter-policy present in hat write-up.

21. Seniors issue counter-policy in despatches or verbally.

22. Senior not grooving personnel in on post or seeing to proper hat study.

23. Valuable final product missing for hat.

24. Purpose and/or valuable final product missing in hat for group's whole activity.

25. An *earlier* or more basic hat is out such as a top executive not knowing the basic staff hat fully.

26. Nonutilization in any of its various forms such as a personnel trained for one thing is required to do something else. Or his training is not used. Or he is not used at all.

If the Hats Officer can do his job and not get caught up in these pitfalls, we'll really soar.

ORG SERIES 21

DUPLICATING FUNCTIONS

All you have to do to run out of personnel, finance and get no production is to duplicate the same functions that give the same product in an org.

Take three orgs side by side under the same management. Only if each division of each org had entirely different products would this be possible.

Now let's do it wrong. Each of these three orgs has an HCO and full personnel duties. Each separately promotes. Each has its own finance office, each has its production div producing the same products. Each has its own correction div — the place in general would be very overmanned, yet each div would be undermanned for its full functions. The product would be terrible if it existed at all. Morale would be ghastly, interorg collisions continual.

The right way would be to work out the different products and then assign them to one or another of these orgs. One org would have to be the source org that produced the other two. One org would have all the finance with liaison only in the other two orgs. One org would have to hire, hat and train with only liaison in the other two. The orgs would have org boards which *had* the function but under it would be the note "Liaison with _____," source org.

In the impatience and emotion of organizing one org tends to individuate and establish a duplicate function because "it can't get service." This begins the catastrophe. Now they'll all begin to go broke while having men bulging out of the windows.

In looking over potential insolvency, look over duplicate functions.

Adds to Personnel Series 8,
HCO PL 16 Sept. 70 I,
ETHICS AND PERSONNEL
(Applies to E/Os)

An I&R Form 1 (HCO PL 6 Oct. 70 I, INSPECTION OF LOW STATS) must be done by Inspections and Reports on the dept or div or activity that is demanding personnel, at the request of Personnel, Dept 1.

When the I&R Form 1 is done by the Inspector (be it the Ethics Officer or another) the *additional* questions on Personnel Series 8, A–H, are covered by the Ethics Officer who personally gets the answers to them.

His answers are added to the I&R Form 1, together with any ethics actions proposed.

In this case the routing of the I&R Form 1 is Inspector to E/O to Personnel.

Personnel adds his recommendations regarding either (a) to expedite needful personnel or (b) to demand utilization of existing personnel.

The I&R Form 1, with the E/O's added report and Personnel's added recommendations then follows the routing as laid down on the form, and the standard procedure for the form is carried out.

WITHOUT THE AUTHORIZATION OF THE EXEC DIR OR HCO ES FOR THE ACTIONS RECOMMENDED ON THE I&R FORM 1, NO TRANSFER OR ASSIGNMENT MAY TAKE PLACE AT ALL. THE EXEC DIR OR HCO ES MAY ORIGINATE ORDERS ON THE PERSONNEL REQUEST BUT SUCH ORDERS MUST BE BASED ON THE COMPLETED I&R FORM 1 WITH E/O REPORT AND

PERSONNEL RECOMMENDATION TO HAND AND THESE DOCUMENTS MUST ACCOMPANY SUCH ORIGINATED ORDERS BEFORE THE HCO AREA SEC IS EMPOWERED TO ISSUE AND ENFORCE THEM.

No more than 24 hours should be allowed from the receipt in Dept 3 of Personnel's request for I&R Form 1 to the receipt of the completed action by the HCO Area Sec.

PERSONNEL SERIES 19
ORG SERIES 25

LINES AND HATS

It will be found that in organization there are *MANY* major factors involved.

The following three, however, give the most problems:

1. Personnel

2. Hats

3. Lines

Technology is a subdivision of both personnel (who may have to be specially trained before they can be considered personnel) and hats (which are mainly admin technology and line functions).

To solve any problem, one has to recognize what the problem is. One cannot solve problem A by trying to solve problem B or C. Example: Problem: broken-down car. You cannot fix the car by repairing the kitchen lino. Example: You cannot floor the kitchen by fixing the car.

All this may seem obvious when obliviously stated. But there is a more subtle version. ANY PROBLEM THAT DOES NOT SOLVE IS NOT THE PROBLEM. There must be some other problem.

Locating and isolating situations (problems) in an organization is the technique of the Data Series. That technology will find for one the problem that should be solved.

As there are three major organizational factors these then also form the core of all organizational situations (or problems, same thing).

Each one of these is its own zone — personnel, hats, lines.

Each one has its own problems. There are situations in personnel. There are situations in hats. There are situations in lines.

They *are* related. They are not identical.

You will find you cannot wholly solve a problem in lines by solving personnel. You cannot wholly solve a problem in hats by solving lines. You cannot wholly solve a problem in personnel by solving the other two.

Example: Production hours are down. Fifteen new personnel are added to the area. Production stays down. It was a problem in lines.

Example: Confusion reigns in the pipe shop. The lines are carefully straightened out. Confusion still reigns. It was a problem in hats.

Example: Broken products are wrecking org repute. Hats are carefully put on. Products continue to be broken. It was a problem in personnel.

Example: The org stays small. Executives work harder. The org stays small. It was a series of problems in personnel, hats *and* lines, none addressed at all.

You will see symptoms of all this in various guises. The test of whether or not the right problem was found is whether or not production increased in volume, quality and viability.

In actual practice one works on all three of these factors constantly — personnel, hats and lines — when one is organizing.

You will find with some astonishment that failure to have or know or wear or do a *hat* is the commonest reason why *lines* do not go in. That personnel is hard to procure and train because hats and lines are being knocked out. That hats can't be worn because lines or personnel are out.

Situations get worsened by solving the wrong problem instead of the real problem. In the Data Series this is called finding the right *Why*.

Organizational problems center around these three things in the broadest general sense. More than one can be present in any situation.

Production problems are concerned with the particles which flow on the lines, changed by the hatted personnel, with consumption and general viability. So to make a full flow from organization through to distribution, one would add raw materials, changed state of materials and their consumption. Organization is not an end-all. To have value it must result in production.

But when personnel, hats and lines are not solved, production is very difficult. Therefore to get production one must have an organization to back it up. And personnel, hats and lines must exist and be functional. If these exist, the rest of the factors of establishment can be brought into being.

It goes without saying that organization involves other problems like space, materiel, finance, etc. These and many more also enter into "Whys" of no production. But dominating others are problems in personnel, hats and lines. Others tend to solve if these are handled and organized.

PERSONNEL SERIES 20

PERSONNEL PREDICTION

Sudden and unauthorized transfers of personnel for whatever reason disrupt hats and lines. Every such transfer is a failure to predict concerning personnel.

By a few transfers ("musical chairs"), an area can be totally unmocked.

Personnel people tend to undervalue the time and care necessary to train, hat and apprentice people.

Even a small unit is a "working installation" if it produces. An order to "turn over the hat this morning and take another post" is quite unreal.

Prediction is the button that is usually out in personnel handling.

How many will we need in _____ weeks or months? is the key question. It is the one Personnel should *continually* work on. Stressing only "Who can we assign to _____?" shows a lack of prediction.

Man tends to run in today and seldom in tomorrow much less next week or year. The fault will someday destroy him as a species. He is even unable to predict the fate of his habitat, the planet.

Thus Personnel should be very wary of this fault.

Recruiting for tomorrow instead of yesterday, people in full-time training, future executives being sorted out by today's performance all add up to good prediction by Personnel people.

One must catch up the backlog of yesterday's needs by gradual moving up into the future.

Every key post should have a deputy in training or in apprenticeship for the post. By key post is meant one that has urgent responsibility and great expertise.

Personnel will see where it stands by just listing their *current* answers to these questions:

1. What are the key posts of the org or activity that require *great* expertise and *training*? From top to bottom list them out.

2. How many of the above list have people in training or apprenticeship for them?

3. What will be the personnel scene on these posts in one year?

4. What plans did you have *yesterday* to do this?

5. What plans can be made now to do this?

Having actually done the above questions, one will see what prediction consists of regarding personnel and a sample of what it means to predict.

This should be done at full org level and then at divisional level and then at department level.

Then one will see that sudden transfers done without training or apprenticeship can be avoided in the future at key levels IF ONE PROGRAMS IT *NOW*. And then ACTS to make the program work out.

Where prediction is out, expansion becomes impossible to do without collapse.

For one has to predict expansion as well.

An action on expansion would be:

1. To increase the org's stats five times (GDSes and GI) how many more trained, hatted people would be needed:

    a. In the CO or ED Office?

    b. In HCO?

    c. In Div 2?

    d. In Div 3?

    e. In Dept of Training?

    f. In the HGC?

    g. In Qual?

    h. In the Distribution Division?

    i. In the LRH Comm Office?

    j. In the Estate area?

    k. In the Dept of Special Affairs?

    l. In space?

m. In furniture?

n. In equipment?

o. In decoration?

p. Finance?

q. Personnel care (food, shelter, clothes)?

While the last (l to q) are not properly "Personnel" the personnel action would collide with them so hard that personnel action would be *stopped*. "Do not hire anyone else!" "Do not _____." "Do not _____."

So somebody says, "We are going to boost the GI from $100 to $50,000."

Well, to do that one would have to promote and deliver as well as make money.

So, when such a prediction is made, what does a good Personnel Officer do?

He does the computations outlined in this policy letter and any other that seem indicated and says, "There you are, chums. This is my part of the deal and (presenting a plan) this is how I'll go about it, to hire, recruit, get trained and apprenticed the needful personnel. Now what are YOU doing about (l) to (q) in this PL so you don't stop *my* progress doing *my* job of getting you eighty additional, functional, useful, nongoofing, producing staff?"

This wakes up the prediction elsewhere so Personnel's prediction doesn't fall down plop.

Once the action is begun, part of the prediction is that it will require continuous guiding, handling and pounding to make it come true.

For instance it can be predicted that as Personnel loads them in there will be failures to program, hat, train, apprentice and utilize. One Personnel loaded an org full and a month later *fifty-seven* nonutilized, nonassigned people were combed out of the debris. "But they are so new . . ." "But you can't assign . . ." etc., etc. And Personnel got blamed for recruiting "unsuitable people." Because the hatting, training, apprenticing actions were neglected! You can *only* recruit untrained people, really.

So Personnel regards unutilized people as a backlog on his lines. Recruited not utilized means he still has them as they have not "fed into the org."

"Prove you have used what I got. Show me the programing of their training. How many have hats? How many are apprenticed?" These are legitimate Personnel questions. And they are demands.

Until utilized, personnel are regarded as still on Personnel's plate no matter where they've gotten to in the org.

Otherwise, Personnel is pounded, pounded for people, people, people when the halls are impassable with nonutilized personnel.

Yet I've never heard a Personnel man say, "What'd you do with the guys I got you last week?" It would produce some blushes.

Personnel aren't personnel really until they are utilized.

Hectic transfers from working posts, "musical chairs," all come from lack of personnel programs based on predictions.

When programs *are* made and are in action, a failure to predict probable failures to hat, train, apprentice, post is a legitimate prediction and should be watched carefully and corrected by Personnel.

REVISED 1 JUNE 2000

REMIMEO

PERSONNEL SERIES 20-1

COMPLEMENT

(Originally written by LRH for the *Apollo* OODs
of 8 Nov. 71. Issued as an HCO PL on 24 June 73.)

Some recent personnel troubles became explained when it was found that the basic complement of an org had never been filled.

The concept of what is a "complement" has been misunderstood in HCO and is probably generally misunderstood. This means the officially allowed number of persons and the officially designated posts for an activity, whether an org or a ship.

Without these basic complements orgs get misposted. Instead of ten auditors they have one auditor and nine admin personnel somewhere else.

This general concept of complement is generally missing and underlies the reason why org boards are, to some degree, in disuse.

In any org which is not doing well you may find not enough personnel and too many personnel. You may also find that the personnel there are not posted onto the post necessary to be held.

Designating the post necessary to be held is what is meant by "assigning a complement."

I never realized the concept was hard to get across until recently. In the dictionary it says that a complement is simply a full list of the officers and men of a ship. This falls so far short of the actual definition that it generates confusion.

A complement is the full list of posts and where they belong on the org board, which must be held. This gives you a slightly different idea of what is meant by "complement."

Two orgs, for instance, didn't have a standard complement. They simply had all possible posts which could be held in the org. This does not tell you what posts should be held in the org.

Therefore, personnel control is not possible.

In the case of another org there was a maximum allowed complement but it was never filled up.

There is a complement for every separate and individual org.

Until the complement of an org is laid out, known and filled, there will be continual trouble with personnel and difficulties in handling it.

The sooner this is straightened out, the easier time there will be for all.

WHY HATTING?

A few days ago when I found that musical chairs and flubbed hatting had unstabilized some areas, I wondered whether or not this might stem from some social aberration that was very general in the societies in which we are working.

And it seems to have been the case. I worked on it a bit and found this:

LAW: THE POWER OF A THETAN STEMS FROM HIS ABILITY TO HOLD A POSITION IN SPACE.

This is quite true. In *Scientology 8-80* the base of the motor is discussed. It holds two terminals in fixed positions. Because they are so fixed, power can be generated.

If a thetan can hold a position or location in space he can generate POWER.

If he cannot, he cannot generate power and will be weak.

We have known this for nineteen years. It applies here.

Observation: MODERN SOCIETY TENDS TO CONFUSE AND UNSTABILIZE PERSONS WITH ITS HECTIC PACE.

Observation: BEINGS WHO ARE AFRAID OF STRONG PEOPLE TRY TO WEAKEN THEM.

Observation: PERSONS WHO ARE PUSHED AROUND FEEL THEY CANNOT HOLD A POSITION IN SPACE.

Observation: PEOPLE HATE TO LOSE THEIR POSTS AND JOBS. THEY FIND IT DEGRADING.

In processing, picking up this chain of lost positions achieves very good gains and rehabilitates a person's ability to hold a job.

LAW: BY GIVING A PERSON A POST OR POSITION, HE IS SOMEWHAT STRENGTHENED AND MADE MORE CONFIDENT IN LIFE.

LAW: BY LETTING A PERSON RETAIN HIS POST, HE IS MADE MORE SECURE.

LAW: BY HATTING A PERSON, HE IS GREATLY STRENGTHENED AS HE IS HELPED TO HOLD HIS POST.

A basically insecure person who feels he is unable to hold his position in space is sufficiently strengthened by hatting to feel secure enough to do his job.

LAW: HAVING A HAT, BEING HATTED AND DEMONSTRATING COMPETENCE MAKES A PERSON FEEL CAPABLE OF HOLDING HIS POSITION IN SPACE AND HE BECOMES MORE STABLE, CONFIDENT IN LIFE AND MORE POWERFUL.

LAW: UNHATTED PERSONS ON A POST CAN BECOME CRIMINAL ON THE POST BECAUSE THEY FEEL INSECURE AND BECOME WEAK.

When a person is secretly afraid of others, he instinctively will not hat them or hats them wrongly and tends to transfer or move them about.

When a person is insecurely posted and insufficiently hatted, he can try to weaken others by trying to prevent their hatting and trying to get them transferred or even dismissed.

This is apparently the social aberration at work.

The answer to a sane org and a sane society is not welfare and removal. It is:

Recruit them,

Train them,

Hat them,

Apprentice them,

Give them a post.

This is so strong in truth it would de-aberrate the bulk of the crime out of a society.

And it sure will put an org in POWER.

DON'T UNMOCK A WORKING INSTALLATION

The stable rule of a good HAS or HCO Cope Officer is NEVER UNMOCK A WORKING INSTALLATION.

It takes a lot of executive time and effort to build up a section or dept or division.

For someone to then come along and scramble it up with transfers is a criminal action.

If a unit, section, dept or division is operating well, *don't unmock it.*

Strengthen it. Hat it better. Put apprentices in it opposite to its posts to learn. Give it help.

But DON'T SCRAMBLE IT.

The work of years can be destroyed overnight by "urgent," "vital" personnel action.

Such crazy actions are only done by people too lazy to recruit and train new people or by unreal financial planning or a failure to get it to produce.

THE MAIN REASON WE HAVE EVER HAD SLUMPS HAS BEEN UNMOCKING ORGS OR UNITS.

Firing people, too heavy ethics, putting off people as "PTS" when all you needed was to pull their withholds, a thousand reasons can be given for unmocking an org or its parts.

They are all coverups for execs who won't keep the place busy and for HCO failures to recruit, train and hat.

To do so is a sign of insanity.

People like their jobs.

DON'T UNMOCK A WORKING INSTALLATION.

HCO POLICY LETTER OF 2 OCTOBER 1971

REMIMEO

PERSONNEL SERIES 23

HCO PUZZLES

There are some fundamental problems in HCOs that make puzzles.

NO STAFF

A. When an HCO is nonfunctional, *it* needs new people.

B. As it is not getting in any new staff, it of course cannot be restaffed or replaced.

These two circumstances (A and B) add up to a total impasse.

Until this impasse is broken the situation will remain impossible.

A way to break it is to take *any* existing staff, put a Dept 1 there and get people in.

If an HCO is so blocked, the normal staff losses will in time unmock the org.

BACKLOGS

When *any* part of an org — or HCO — backlogs in despatches, situations, pcs, the amount of dev-t which will *then* occur will make the place look frantic and busy but not one bit of production will actually occur.

All the effort is being spent fending off the traffic caused by the backlog itself!

An HCO for instance can furiously generate dev-t by calling everything it gets dev-t.

In this way it can spread chaos through the org.

"I want to report _____," "I'm sorry we're busy" will add up at last to nothing *but* dev-t in the whole org.

A hurricane of "activity" is visible because the area has not handled anything to begin with. These unhandled matters recoil on the area as new traffic.

Result, very busy but no production.

The answer is studiously handle or make the area handle everything that comes its way at once — backlogs get caught up. The area gets calm and production occurs.

BASIC ACTIONS

An HCO only begins to function when it has an up-to-date, *in use* org board and an up-to-date, in-use staff list.

If those two things aren't in, a puzzle results almost at every turn consisting of WHO and WHERE, and WHO isn't WHERE, and what's empty.

One org couldn't for the life of it figure out why it got no customers.

When a common paper org board (just paper with lines on it and written with a felt pen) was put up, it turned out that they had no Registrar! Fact. An HCO Expeditor was at the Registrar desk but "couldn't be hatted" "because he was an HCO Expeditor." He was not able to registrar because he "was not the Registrar." As soon as an org board went up, the post was seen to be empty.

OMITTED DATA

The reason HCO or other divisions in the org become puzzles which won't resolve is:

THE MOST COMMONLY OVERLOOKED WHY IS AN OMITTED DATA, TERMINAL OR ACTION.

Because it isn't there to *see* it did not get put down as an outpoint. One had to know the *scene* to be able to know it *should* be there.

Thus, lack of staff or lack of hats or lack of an apprentice for a key post is almost never noted.

AN ETHICS CYCLE

When HCO doesn't function or form or do its job, parts of the org begin to overload.

Duties don't get done by overload. Mistakes begin to be made because of duress.

Ethics moves in.

Almost all harsh ethics periods trace back to HCO failures to function in the first place.

The answer is to make HCO get ethics in on itself and do its job before it starts pounding heavy ethics into the rest of the org it overloaded or improperly manned to begin with.

The first target of Ethics must be any outness in HCO itself.

Dept 1's (Personnel) failures to act will inevitably get expressed as Dept 3 (Ethics) overreaction on the rest of the org.

HCO must solve puzzles, not make them.

A smooth, producing HCO can and must exist in every org.

Some of the above tips can help bring it about.

PERSONNEL PROGRAMING

(Cancels and replaces HCO PL
20 Jan. 72 of the same title.)

A program can be defined as:

"A plan of study for an individual student over a given period."

"A plan of procedure; a schedule or system under which action may be taken toward a desired goal. The keynote is a sequence of actions."

"To work out a sequence of operations to be performed by a person or computer."

The root words associated are *programme* (French), "a public notice," and *prographein* (Greek), "to write before" *(Webster's 7th Collegiate Dictionary)*.

A Personnel Programer works with individual staff members and draws up workable personnel programs and sees that they are fully executed.

The purpose of a Personnel Programer is to help LRH to expertly program each staff member to a point of real success on his own post so he can operate well as a member of the group and attain higher and higher levels of skill, knowledge and ability through full use of the technology of Scientology and Dianetics.

HCO POLICY LETTER OF 12 MAY 1972R
REVISED 27 OCTOBER 1982

REMIMEO
INT FINANCE NETWORK
FOR ENFORCEMENT

ETHICS

EXECUTIVE SERIES 13
PERSONNEL SERIES 25
FINANCE SERIES 12

PTS PERSONNEL AND FINANCE

PTS means Potential Trouble Source. This is a person who is connected to a suppressive person, group or thing. (For further data on PTSness see HCOB 24 Nov. 65, SEARCH AND DISCOVERY, and HCO PL 27 Oct. 64, POLICIES ON PHYSICAL HEALING, INSANITY AND SOURCES OF TROUBLE.)

NCG means No Case Gain despite good and sufficient auditing.

A chronically ill person, whether the person is known to be connected to a suppressive or not, is always found to have been so connected and PTS.

IT IS UNSHAKABLE POLICY HEREAFTER THAT NO PERSON WHO IS PTS OR CHRONICALLY ILL OR WHO GETS NO CASE GAIN MAY BE ON FINANCE OR REGISTRAR LINES OR IN TOP COMMAND POSTS OR AS HAS OR ETHICS OFFICER OR MAA.

TECHNICAL FACT

A person who is connected to a suppressive person, group or thing will dramatize a "can't-have" or an "enforced overt-have" on an org or staff members.

A "can't-have" means just that — a depriving of substance or action or things.

An "enforced overt-have" means forcing upon another a substance, action or thing not wanted or refused by the other.

The technical fact is that a PTS person got that way because the suppressive *was* suppressive by depriving the other or enforcing unwanted things upon the person.

The PTS person will dramatize this characteristic in reaction to the suppression.

Therefore, a PTS person as an ED, CO, product officer, org officer, Treasury Sec, Cashier or Body Reg will run a can't-have on the org and its staff by:

a. Refusing income,

b. Wasting income made,

c. Accepting wrong customers (like psychos) and forcing them on the org,

d. Fail to provide staff or service,

e. Advocate overt products.

HISTORICAL

When staffs went on proportionate pay in the late 1950s, so long as I ran the orgs directly the staffs made more money than before.

When I moved off these lines directly, the staffs began to receive less money personally.

At that time it seemed to me that proportionate pay served as an excuse to some in an org to run a can't-have on the staff.

We knew that some Registrars could take money in easily and others never seemed to be able to.

The technical reason for this has just emerged in another line of research entirely.

In completing materials and search on Expanded Dianetics, I was working on the mechanism of how a PTS person remained ill.

I found suppressives became so to the person by running a "can't-have" and "enforced overt-have." This pinned the PTS person to the suppressive.

Working further I found that a PTS person was a robot to the suppressive. (See HCOB 10 May 72, ROBOTISM)

This research was in the direction of making people well.

Suddenly it was apparent that a PTS person, as a robot to SPs, will run "can't-haves" and "enforced overt-haves" on others.

Checking rapidly, it was found that where finance lines were very sour a PTS person was on those lines.

RECOVERY

PTS tech, Objective Processes, PTS Rundowns, Money Processes and Expanded Dianetics will handle the condition.

However, one cannot be sure that it has been handled expertly in orgs where a money "can't-have" has been run as its tech quality will be low due to an already existing lack of finance.

Only stats would tell if the situation has been handled fully.

Thus the policy stands. Handled or not handled, no person who is PTS or who has no case gain will be permitted in top command or any lines that influence finance.

Any org which has consistently low income should be at once suspect of having PTS or NCG persons on the key finance posts, and an immediate action should be

taken to discover the PTS or NCG condition and replace such persons with those who are not connected to suppressives or who do get case gain.

Nothing in this policy letter permits *any* PTS person to be in an org or cancels any policy with regard to PTS.

This policy letter *requires* direct check, close investigation and handling of PTS or SP situations on these posts that may go undetected otherwise.

NOTHING IN THIS POLICY LETTER PERMITS ANY KEY ORG POST TO REMAIN EMPTY.

NATIONAL

As a comment on something that may impinge on orgs and might affect them, the FOREMOST reason for a failing national prosperity and inflation is a personal income tax agency. This runs a vicious can't-have on every citizen and makes them PTS to the government. Individuals even begin to run a can't-have on themselves and do not produce. This IS the cause of a failing national economy. It can be a factor in an org and must be handled on the individuals so affected.

ESTABLISHMENT OFFICER SERIES 23

THE VITAL NECESSITY OF HATTING

On a graph analysis of past stats, my campaign on hatting where a hat was a checksheet and pack apparently introduced a steady rise of the International Gross Income.

Studying this further I discovered a new basic, simple fact:

HATTING = CONTROL

A person who is hatted can control his post.

If he can control his post he can hold his position in space — in short, his location. And this is power.

When a person is uncertain, he cannot control his post, he cannot control his position. He feels weak. He goes slow.

If he can control his post and its actions he feels confident. He can work effectively and rapidly.

The key is CONTROL.

Control is the ability to START, CHANGE and STOP.

When he is hatted he knows the tech of HANDLING things. Thus he can control them. He is at CAUSE over his area.

If you have an org composed only of weak wobbly posts, they tend to collapse in on each other. There is no POWER.

The org then cannot be CAUSE over its environment because it is composed of parts which are not cause. The whole is only the sum of its parts.

If all the parts are each one at cause, then the whole will be at CAUSE over its environment.

Only an org at CAUSE can reach and CONTROL.

Thus a fully hatted org can be at cause over its environment, can reach and control its fates and fortunes.

THUS THE PRIMARY TARGETS OF AN ESTO ARE:

A. ESTABLISHED ORG FORM and

B. FULLY HATTED PERSONNEL.

BASIC SEQUENCE OF HATTING

1. Recruited or hired. Signs contract.
2. Instant-hatted for the job assigned as an HCO Expeditor.
3. Staff Status 0.
4. Basic Study Manual (if the staff member has not previously done the Student Hat or Primary Rundown).
5. Staff Status I.
6. Staff Status II.
7. Posting as other than an HCO Expeditor.
8. Full hatting with a checksheet and pack fully done with M6, M7, M9, M3 and M4 Word Clearing.
9. Eligibility for study and auditing (OR for staff service or study).
10. Must have a stat and demonstrated he has produced on post.
11. Purification Rundown.
12. Objective Processes: CCHs, 8-C, SCS, Havingness, etc.
13. Scientology Drug Rundown (if required).
14. Method One Word Clearing, Student Hat.
15. Administrative or tech training (OEC or auditing).

Flag Orders in the Sea Org may change this lineup slightly but it is basically the same.

No one should have any other training, much less full-time training, before step 12 in the above.

After a staff member has completed Staff Status 0 he may receive PTS handlings and study the PTS checksheet and may have emergency assists. He may also be audited by students and TTC if he has rising stats.

There are time limits placed on how long it takes to do SS I and SS II. A person who can't make it is routed to Qual where he is offloaded with advice on how to get more employable. (In the SO it is Fitness Board.)

TIME–TESTED

The above is the route that has been tested by time and found good.

Other approaches have NOT worked.

Granting full-time training at once is folly. The person may get trained but he'll never be a staff member. This is the biggest failure with auditors — they don't know the org. Admin training with no org experience to relate it to is a waste of time.

This was how we built every great org. And when it dropped out the org became far less powerful.

Old-timers talk of these great orgs in their great days. And they will tell you all about the org boarding and hatting that went on. How the Hatting Officer in HCO and the Staff Training Officer in Qual worked as a team. And how fast the lines flew.

The above steps have stood the test of time and are proven by stats.

RECRUITING AND HIRING

You *never* recruit with a promise of free courses or free auditing. Not even HASes or HQSes. You recruit or hire somebody to be part of the team.

OPEN GATE

If *any* opinion or selection is permitted as to who is going to be let on staff, *all* recruitment and hiring will fail.

By actual stats when you let *anyone* say, "No! Not him! Not her!" the gate shuts, the flow stops. And you've had it.

Requirements and eligibility *fail*. The proof is that when they have existed in orgs, the org wound up with only PTSes and no-case-gains!

The right answer is FAST FLOW hiring. Then you have so many that those who can't make it drift low on the org board or off. You aren't trying to hold posts with unqualified people "who can't be spared."

In a short-staffed org "looking only for the best people" the guy nobody will have gets put in an empty "unimportant" department. He's now a Director!

It only happened because you didn't have dozens.

The answer is NOT lock the gate or have requirements. The answer is HAT.

An org that isn't hatted goes weak and criminal.

Don't be selective in hiring or recruiting. Open the gates and *HAT!*

Follow the steps given above and you have it.

Don't spend coins like training or auditing (or travel) on people until they have proven their worth. No bonuses or high pay for anyone until they have reached and attained step 10 (a good stat). The cost of such fast flow hiring is not then a big factor.

The only trouble I ever had with this was getting div heads to UTILIZE their staff. A FIRST JOB FOR AN EXECUTIVE IS TO GET THINGS FOR HIS PEOPLE TO DO. AND KEEP THEM BUSY AT PRODUCTIVE THINGS.

So I used to have to go through the org that did FAST FLOW HIRING regularly and get people to use their new people. And to move off those who could not work.

This was ALL the trouble I had with the system.

And until I enforced FAST FLOW HIRING there was always some effort by someone to close the gate.

ALL the great executives in Scientology came up in such orgs.

With a *flow* of people the best move on up. The worst, if any, drop off.

Only orgs with restricted hiring or recruiting give trouble.

IN A FAST FLOW HIRING ORG THE HAS AND ESTOs *MUST* BE ON THE BALL. THE BREAKDOWN OCCURS WHEN THEY DO NOT *HAT* AND KEEP ON TOP OF THE PERSONNEL SCENE.

Fast flow hiring only breaks down and gets protested where HCO and Estos are not doing a top job. They have to really *handle* the personnel, post them, hat them, keep the form of the org.

A fully formed org in a heavily populated location would need hundreds of staff. It would make hundreds of thousands.

But only if it is fast flow hiring, hatting, holding the form of the org, and only then could it produce.

RECRUITING AND HIRING

Refs:
Vol 1 OEC policies regarding personnel hiring and status
Flag Orders on Sea Org recruit training

ANY DIVISIONAL SECRETARY MAY RECRUIT OR HIRE STAFF FOR HIS OWN DIVISION.

The divisional secretary may use the staff in his own division.

Representatives of networks in an org or a continental office may also take advantage of this policy letter. Bureau heads of CLOs are included.

The org that hires or recruits staff may retain that staff.

It is only required that:

a. The person be placed on a routing form for new personnel in his org.

b. That any unusual pay arrangement or any pay arrangement be passed by FP and that the findings of FP are superior to or senior to any verbal or written promise to the person by the divisional secretary.

c. That HCO PL 4 Jan. 66RA V, PERSONNEL STAFF STATUS, is followed.

d. To become "Permanent" and be entitled to training or auditing and post protection a person must have signed a 2½-year contract and passed the Staff Status II checksheet. For full-time training, a 5-year contract must be signed in advance with the beginning date at the completion of his training.

SEA ORG

A. The person signs an SO contract.

B. At the end of 45 days he must pass a fitness board and have a recommendation by his divisional secretary.

C. He must attain the status of a Product 0 before he receives other training or auditing on a part-time basis.

D. He may not receive full-time auditor or admin training until he is a Product 2.

E. He may not hold any rating or rank other than "Swamper" until he is a Product 2.

If a divisional secretary does not have his staff on individual stats, if his staff is not busy actually producing viable products, he may lose such staff by transfer ordered by the HES or Supercargo:

i. By published order.

ii. When the divisional stats are downtrending, Emergency or lower, for 3 consecutive weeks.

iii. When the divisional secretary has neglected the rules of this PL, such as not getting his staff to Provisional — Staff Status I or Product 0 in a reasonable time or not having them on individual stats or routing them for org boarding.

All these conditions (i) to (iii) must be present for a divisional secretary to have staff he recruits transferred out of his division.

In the case of an ORG, it may have staff transferred out of it only when it is in Emergency by trend of six weeks on paid completions or GI, when it is found to have falsified its stats, if it does not have an active Qual Cramming doing an honest job OR when its cash-bills tend toward insolvency.

Nothing in this PL restrains the ordering of a veteran to Flag as Flag furnished the veterans in the first place, but there must be adequate replacement.

No person recruited by a divisional secretary may be sent at org expense to a higher org for training or grades. But if trained, may replace a fully contracted staff member who has been reliably producing at the org to do so.

ANY DISPUTES ARISING BY REASON OF THIS PL ARE TO BE RESOLVED BY THE CONTINENTAL LRH COMM.

Nothing in this PL relieves the HAS or Flag Personnel Procurement Officers or any Recruiter of his duties or responsibility for recruiting.

ORG SERIES 36

MANNING UP AN ORG

THE SEQUENCE OF POSTING DEPTS AND DIVS

You need an org board first and an allocation board.

The sequence in which an org is manned up is roughly:

– Dept 1

– Dept 11

– Reg and Body Routers and Intro people in Div 6

– Dept 12 (enough auditors and C/Ses to approach 2 admin to 1 tech in org)

– Dept 6

– Dept 7

– Dept 3

– SSO and Supers in Qual to train staff

– Dept 5 for CF, Address and Letter Reges

– Dept 4 for promo

– Dept 21 (LRH Comm)

– Dept 10

– Dept 20

– FR and execs

– Full Div 6

– Full Div 1

– Full Div 4

– Full Div 2

– Full Div 5

– Full Div 7

– Full Div 3

(Note, an AO always mans up the AO Dept or Div along with the SH one in each case.)

Wrong sequence of manning is Dept 6, Dept 12, Dept 6, Dept 12, Dept 6, Dept 12, as you wind up with a stuck clinic that won't expand.

Wrong sequence will contract an org while trying to expand it, as the org will go out of balance, bad units, noisy and unproductive.

If manned in a correct sequence, its income has a chance to stay abreast of its new staff additions.

Emphasis on GI without comparable emphasis on delivery and organization can throw an org into such a spin only a genius can run it.

Manned in proper sequence, and hatted as it goes, an org almost runs itself.

Single handing from the top comes from long-standing failures to man or man in sequence, from earlier noncompliance with explicit orders or from not understanding orgs in the first place.

An unhappy org that doesn't produce has usually been manned only partially and out of sequence.

The trick is planned manning, ignoring the screams of those who know best or demand personnel; just manning by posting those who have been screamed for the loudest is a sure way to wind up with no people and total org problems instead of a total org that is prosperous and producing.

Incidentally, this is a rough approximation of the sequence of hats the ED gradually unloads as his org takes over.

HCO PL	11 Aug. 71 II	Personnel Series 22 DON'T UNMOCK A WORKING INSTALLATION
HCO PL	28 Mar. 71 II	PERSONNEL TROUBLES

IT IS A COMM EV OFFENSE TO TRANSFER ANYONE IN AN ORG WHEN THE RECRUITING AND HATTING STATS ARE NOT MORE THAN ADEQUATE FOR THE ORG, and

IT IS A COMM EV OFFENSE TO FAIL TO RECRUIT AND USE THIS AS AN EXCUSE FOR NO TRANSFERS.

In one org it was discovered that they lacked the necessary technical personnel to deliver all of the auditing rundowns available at their org even though teams of auditors had previously been trained on this tech. It was further discovered that the currently posted technical personnel had many incomplete courses, preventing their training on these rundowns and the full delivery of the tech to their public.

Further investigation revealed rampant musical chairs as having both unmocked previous working installations and prevented course completions with new courses begun each time a transfer occurred.

The solution, of course, lies in good application of HCO policy on recruitment in Division 1.

HOW YOU HANDLE DEMANDS FOR PERSONNEL

Refs:

HCO PL	15 Sept. 59 II	HATS AND OTHER FOLDERS
HCO PL	1 July 65 III	HATS, THE REASON FOR
HCO PL	22 Sept. 70	Personnel Series 9 Org Series 4 HATS

HCOs get continual demands for personnel from all areas of an org. To keep an HCO from going mad with all these demands, they must, on every request, (1) have the Dir of I&R do a full utilization survey on the division, dept or section requesting personnel and (2) do a full hat inspection on all personnel in that division, dept or section.

Only if these two steps are done for *each* personnel request will sanity reign in HCOs on the subject of personnel.

HCO PL 15 Sept. 59 II, HATS AND OTHER FOLDERS (Vol 0), HCO PL 1 July 65 III, HATS, THE REASON FOR (Vol 0) and HCO PL 22 Sept. 70, Personnel Series 9, Org Series 4, HATS (Vol 0) must be well known by all staff in Depts 1 and 3.

Personnel can recruit madly, answering every frantic demand for personnel, and yet HAVE THEM ALL WASTED for lack of full hats and full training on those hats.

The whole org can sag and even vanish under these conditions.

So Personnel has a vested interest in hats being complete and staff trained on them. For Personnel people cannot possibly cope with “no pay so can’t hire anyone” and “no people so can’t produce.”

So for every demand for personnel, *ALWAYS* demand a utilization survey *AND* an inspection of hats in that area.

ESTABLISHMENT OFFICER SERIES 43

PERSONNEL POLICY

We are building strongly for the future.

Scientology is going to go on for a VERY long time.

The way to build a strong future is to build a strong organization.

Internally, the only way we have been held back is by out-ethics and nonproduction. This does not build a strong organization or a strong future.

Therefore, we have no room on staffs for those who do not produce — or worse, are extravagant and produce overt products — or (which goes with poor production) are out-ethics.

We need productive people who keep their ethics in.

Individuals, and above all execs, are the building blocks of organizations.

To build strongly for the future, keep the above points in mind where appointing, promoting or handling personnel.

Personnel of that caliber belong outside orgs — they are the pcs and cases. Do not recruit them, appoint them or leave them on post when found.

One can mend people. But one cannot build a new world with broken straws.

It takes the ethical few to handle the many. And these are what our orgs must be built with now. The strong within only then can handle the weak outside.

Make it easy in the future for all of us. We have a long way to go. The speed we get there is measured by the ethical quality of persons on exec posts and on staffs. It is fine to be big brother to all the world — so long as we keep our staffs the top people. Be them.

PERSONNEL SERIES 31

MOONRIPPING

Ref: HCO PL 6 Oct. 70 II Personnel Series 10
"MOONLIGHTING"

"Moonripping" is a contraction formed from the words "moonlight" (the act of working on a job outside an org) and "rip-off" (the act or action of stealing or cheating; exploiting or taking advantage of another or others, especially financially).

In HCO PL 6 Oct. 70 II, "MOONLIGHTING," the last sentence is the operative line, "There is no policy against MOONLIGHTING where it does not injure the org." However, it is another matter where there is active depression of org stats so that staffs have to moonlight for the fellow who is depressing the org stats. Persons depressing org stats to enrich themselves personally by employing staff or promoting moonlighting for self-enrichment are of course committing a suppressive act.

The following are some of the varieties of moonripping:

1. Using the org as an employment agency and hiring people into the org and getting them somewhat trained and processed to use them in an outside business.

2. Holding an executive position on staff so that one can run a business that employs staff.

3. Arranging staff schedules so they can work in the private business.

4. Making people replace themselves in a private business (before going on staff in an org).

5. Concentrating on the outside job to a point where they do not look to the org for support and so don't care at all what happens to it.

6. Using the org and its connections but actually working in a mission and shunting org public to it.

The dividing line is where moonlighting is done in any way to damage or erode org income or staff involvement in their own post.

For instance, an evaluation was done on an org that persisted in staying small. Now most orgs that stay small do so because they neglect to apply policy, but this was a different case: The org in question was kept poor so that the staff would have to moonlight in a business run by a leading executive of that org for his own personal profit. By overtly and knowingly preventing the org from making money (cutative, giveaway prices, refusing to sign up pcs, etc.) the amount available for salaries in the org was kept very low. As their "best friend" this executive then "let them" work in his own company, which he ran on the side and from which he was getting quite well-to-do.

There was another version of this: A nearby business "befriended staff" by getting them to moonlight to the exclusion of their org duties and of course the org made no money. But the staff reasoned that they could not live on their pay while not realizing that their moonlighting was cutting their own pay. They didn't make much working for their "friend" either.

Another version of this was found: The staff auditing which the org owed to their staff was cut off and they were told they had to moonlight and make enough money to personally pay two auditors very high fees to audit them after org hours.

In all these cases the org was being used as a sort of employment agency for the personal profit of someone inside or outside the org.

The crime in these cases amounted to a SUPPRESSIVE ACT.

Anybody having any information leading to the use of org staff as an employment agency, convincing staff the org can't make money, persuading the staff to moonlight, using staff to further their own business, and so forth, must report the matter outside the org to the Inspector General Network.

HCO PL	7 Mar. 65 III	OFFENSES AND PENALTIES
HCO PL	13 July 74 II	Org Series 34 WORKING INSTALLATIONS

There is a condition that can exist in orgs which differs slightly from "musical chairs" (the rapid transfer of personnel from post to post) but is akin to that and every bit as deadly.

We could call it a "quicksilver personnel" scene.

("Quicksilver" is another name for mercury, the silvery-white metallic element, liquid at room temperature, which is used in thermometers, barometers and similar instruments.)

Used figuratively, the term "quicksilver" means something that is quick-moving, unpredictable and as elusive as mercury, or "mercurial." Something that is mercurial is changeable, variable, volatile.

To anyone who has ever observed a drop of quicksilver, or mercury, in an open container or placed on a slab of glass, this will be real. One second it's here, the next second it's there. Just about all you have to do is breathe on it and it changes its position. And where it *was* a second ago there's now nothing.

It is miserable (if not impossible) for an executive or management body trying to run things with staff doing a quicksilver. One can hit up against some nasty surprises.

For example, an org's personnel scene may look great on the board, with posts filled, hats existing and known, production occurring and on the rise — all is looking good when suddenly the stats crash.

An initial check may show there haven't honestly been any post transfers, per se. But dig a bit further and you're likely to find a quicksilver personnel scene. The top delivery auditor is off on a two-week vacation. The Qual Sec has been fired on a recruitment tour. The Reg has gone out-ethics and been suspended, unreplaced, pending some ethics handling. The Chief Officer is off on maternity leave and the CO, holding her post from above, is being the guest speaker at an event in the next city.

It happens and it happens not only in Class IV orgs but in the higher service orgs and management units where tours are essential and missions need to be fired and other situations can crop up requiring personnel.

It has shown up drastically at times in several large orgs. In one, the head of a vital network went off on mission and, with no one left being the senior, the stats in the area crashed. In another, the sales manager took his leave, his routine functions were ignored and sales suffered severely. And in still another org, no less than *six* key delivery terminals were all found to be out on regging tours in one week, some of them over a period of several weeks, at a time when delivery of paid-in-full services was backlogged!

None of these terminals had been removed or transferred or promoted. And one could say the actions being done are all covered in some way in policy, are needed, and therefore justified. But these terminals were all off post unreplaced, weren't they?

That's a quicksilver personnel scene. It's unstable.

CONTRIBUTING FACTORS

Executives who issue orders that unmock working installations where production is occurring at "A" to get something done at "X" bring about such scenes.

Personnel who, like quicksilver, accommodatingly move off their assigned posts unreplaced to do something else at the first invitation or order, help to generate and sustain such scenes.

Seniors who permit or condone this are also a party to them.

Personnel can do a quicksilver for any of a number of reasons. For some, the chance to go off and see other people and new places may be an alluring prospect. Some are too timid to refuse a destructive order and so they comply, under protest. For others there is financial gain involved — there are often commissions or a bonus at stake.

Tours have been used by some, apparently condoned by executives, to take longer leaves (more time off on leave per year) by combining 4 to 6 or even 8 weeks of a "regging tour" with a "leave," with the org paying both the person's fare and living expenses and no clear distinction made between the period of "tour" and the period of

the "leave." (While this is part of an unstable personnel scene, it is also a situation requiring a separate ethics handling in itself.)

Sometimes a staff member is made to feel, by a very convincing exec, that the action which calls for his suddenly going off post with no or inadequate replacement is actually more important than his job. Where this threatens production and there is no adequate replacement, this is almost always a falsehood.

It is true that missions need to be fired. Tours are vital to income and delivery. Staff sometimes do need to go off post temporarily for handling of one type or another. Events are valuable in terms of promotion, goodwill, PR and sign-ups, and for certain types of these, key personnel or trained tech delivery personnel may be required. Emergencies do arise. Personnel are entitled to annual leave. And speed of operations is important.

On the plus side, we do have capable and versatile staff who are willing to extend themselves, when needed, to make things go right. We have demanding, fire-breathing executives who are out to handle situations and open up new fields for delivery which, in itself, is a good thing. And many of these go about it standardly.

But the senior or exec at any level who endangers ongoing delivery and production and/or unstabilizes a producing personnel scene to get these things done is simply advertising to one and all that he can't predict and plan and organize or get others to do so. Control is lacking here as well as just plain common sense. The kindest thing one could say about such an exec is that he is shortsighted. And "quicksilver" is a rather mild term for the staff member who steps so easily off his post and leaves a hole in the lineup with no thought of the consequences.

One could say that everyone has personnel problems. BUT that is no Why.

HANDLING "QUICKSILVER PERSONNEL" SCENES

The first policies *missing in application* are those covering replacements and hat turnovers.

BECAUSE IT IS A "*TEMPORARY*" ABSENCE, NO ONE IS DEMANDING REPLACEMENT AND TURNING THE HAT OVER TO SOMEONE WHO CAN COVER THE POST *COMPETENTLY*.

But policies exist in abundance on this subject. HCO PL 29 Aug. 70 I, Personnel Series 1, PERSONNEL TRANSFERS CAN DESTROY AN ORG, points up the outnesses which can destroy an org faster than any others. HCO PL 7 Jan. 66 I, LEAVING POST, WRITING YOUR HAT, covers the staff member's responsibility for a post he is vacating under *any* circumstances. HCO PL 20 Apr. 69 II, HATS, NOT WEARING, emphasizes the staff member's responsibility for knowing that he *is* the Qual Sec, or Reg, or the post title for the post and functions he has accepted. HCO PL 11 Aug. 71 II, Personnel Series 22, DON'T UNMOCK A WORKING INSTALLATION, cites the main reason we have ever had slumps in orgs.

The personnel policies are there. But very often, where a "quicksilver personnel" scene is permitted, BECAUSE SOMEONE PULLS OFF A SUCCESS IN ONE AREA, EVEN THOUGH STATS IN HIS OWN AREA MAY CRASH, THE EXISTING ETHICS

NAVIGATE
FIRST PAGE
SEARCH
FIND
AGAIN
EXIT
CONTENTS
ORG BOARDS
INDEX

POLICIES THAT COVER SUCH A CRASH OR THE COLLAPSE OF AN AREA MAY BE OVERLOOKED OR DELIBERATELY IGNORED.

So how do we handle "quicksilver personnel" scenes?

The answer is to add some teeth to the existing policies:

1. AN ABSENCE FROM POST FOR EVEN A TEMPORARY PERIOD OF AS LITTLE AS HALF A WEEK IS AN ETHICS OFFENSE, UNLESS SOMEONE IS NAMED AND THERE AS A REPLACEMENT WHO HAS HAD THE POST PROPERLY TURNED OVER TO HIM AND WHO CAN COVER THE POST *COMPETENTLY*.

2. IF SUCH ABSENCE WITHOUT COMPETENT REPLACEMENT OCCURS *AT ALL,* AN IMMEDIATE COURT OF ETHICS MUST BE CALLED ON THE STAFF MEMBER WHO LEAVES HIS POST UNFILLED OR INADEQUATELY COVERED, AS WELL AS ON THE SENIOR OR EXECUTIVE ORDERING, CONDONING OR PERMITTING IT.

3. IF IT OCCURS AND RESULTS IN STATS CRASHING IN A COURSE, A DIVISION, DEPARTMENT, SECTION, UNIT, AREA, ZONE OR ORG, A COMMITTEE OF EVIDENCE MUST BE CALLED WITH *ALL* INVOLVED NAMED AS INTERESTED PARTIES.

The charges are:

CONDONING OR CONTRIBUTING TO CIRCUMSTANCES OR OFFENSES CAPABLE OF BRINGING A COURSE, SECTION, UNIT, DEPARTMENT, ORG, ZONE OR DIVISION TO A STATE OF COLLAPSE

and

NEGLECT OF RESPONSIBILITIES RESULTING IN A CATASTROPHE EVEN WHEN ANOTHER MANAGES TO AVERT THE FINAL CONSEQUENCES.

With this policy made known and enforced, there *is* a cure for those who do a "quicksilver" and for executives and seniors whose out-planning and out-prediction bring about quicksilver personnel scenes.

EXECUTIVE POSTING QUALIFICATIONS

Scientology organizations and their staffs in the past have been subjected to considerable financial losses by appointing to executive positions persons of poor ethics and production records. Therefore this firm policy regarding new appointments to and promotions within Scientology organizations and activities is set and is not to be departed from. Omission of one or more of these in the past has factually cost millions of dollars.

It is expressly forbidden hereafter to propose or post any person to any executive post (Departmental Director or above) without the following:

1. Actual production stats of the proposed person relating to the subject of the post he is being proposed for be found, established and verified.

2. That investigation reveals an acceptable ethics record.

3. Before being posted the person must be checked for any PTSness and any found must be handled.

4. The person must be rolled back for any participation in any black PR activity.

5. The person must be sec checked for false considerations or evil purposes.

6. The person must be false data stripped in relation to the activity he has been or is about to be engaged upon in the organization.

7. In keeping with the policy that any person posted in an executive position in a Scientology organization must be able to achieve, maintain and increase a high level of production and income in his area, the stats found and verified must prove extreme productiveness on the part of the proposed person in the area of the post he is being proposed for. This applies to any executive post. (With the technology and administrative know-how available in Scientology, any exec should, through production and exchange of high quality products, be capable of generating on the order of a million dollars a year for his organization.)

The above requirements are quite in addition to requisite executive status and training certificates held by the person and/or required for the post for which he is being considered. (Ref: HCO PL 29 Dec. 82R II, Rev. 30 July 83, THE TOOLS OF MANAGEMENT)

APPLICATION FOR ACTING STATUS

Before a candidate for an executive posting may assume more than Temporary status, a full CSW covering points 1–7 above and prepared by the Personnel Control Officer must be approved on established executive posting approval lines. The Estab Exec International is responsible for issuing directives setting these approval lines, and for updating them as needed.

Approval lines set up are to include approval of all exec postings by an authorized representative of the Office of Senior C/S Int and an authorized representative of the Inspector General Network.

On receipt of written approval, the candidate is granted "Acting _____" status, and a personnel order to this effect can be issued.

Executive posting CSWs may NOT be allowed to staledate at any point on the approval line.

Establishment and maintenance of approval lines is the responsibility of the Senior HAS International.

REQUIREMENTS FOR PERMANENT STATUS

The following additional requirements are established for *permanent* posting at the level of Departmental Director or above:

8. No person may be permanently posted in a Scientology organization without a thorough apprenticeship under competent supervision before any turnover or permanent posting can occur.

9. No full posting in a Scientology organization can occur until the actual stats of the person achieved during that apprenticeship period have been found to be correct and excellent.

10. No person so assigned as an apprentice on a post may draw a bonus until he is fully Post Purpose Cleared, TIPed, his TIP complete, and he is fully hatted.

APPLICATION FOR PERMANENT STATUS

Once the (Acting) exec has successfully fulfilled the requirements listed in points 8, 9 and 10 above, application is made for Permanent posting. This application follows the same routing as for Acting status. The application consists of a new CSW, with verified evidence of requirements 8–10 above having been met.

Upon receipt of written confirmation of the posting from the Inspector General Network, a personnel order may be issued appointing the executive permanently to that post.

NETWORKS

This policy applies fully to the posting of executives in any of the various management networks, including FBOs, D/FBOs for MORE, Flag Reps, LRH Comms and any other networks.

RAPID POSTING

(Originally written by LRH on 5 Jan. 71.)

Refs:

HCO PL	24 Apr. 72 I	Esto Series 16 HATTING THE PRODUCT OFFICER OF THE DIVISION
HCO PL	31 Oct. 71	FULL HATTING

The speed with which a person can be placed on a post and hatted is consistently underestimated.

An organizing officer who cannot transfer, post and hat a staff member in an hour is little help. The idea that it takes months is an org stopper.

I speak from years of experience. That it would take three days to procure a personnel and several weeks to hat one assaults my reality. People are not that unwilling.

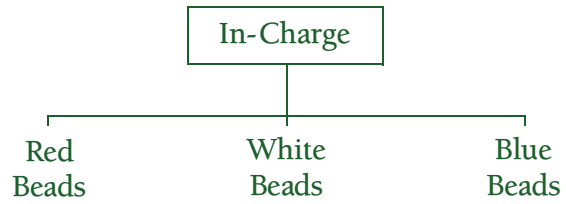
ORG SERIES 1
BASIC ORGANIZATION

What is organization?

Most people have so many associated ideas with the word "organization" that they think of one as an identity or a being, not as a dynamic activity.



Let's see what one really is.

Let us take a pile of red, white and blue beads. Let's organize them.

Now let us draw the org board.

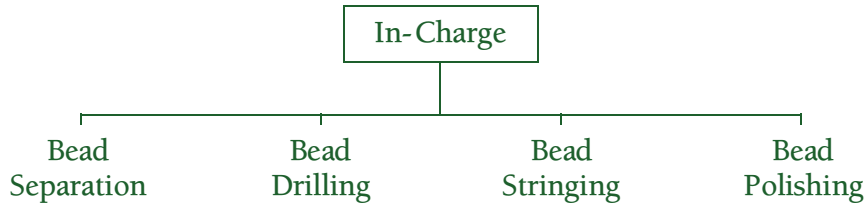
Let us dump them all on top of in-charge, all mixed up in a confusion.

Obviously in-charge must *route* them to dig himself out. So we get:

Thus we find out much of what an in-charge does. He routes. He separates into types or classes of thing or action.

This so far is a motionless org.

We have to have products. Let's say its products are drilled beads, strung beads, boxed beads.



We would get:

Or we would get:

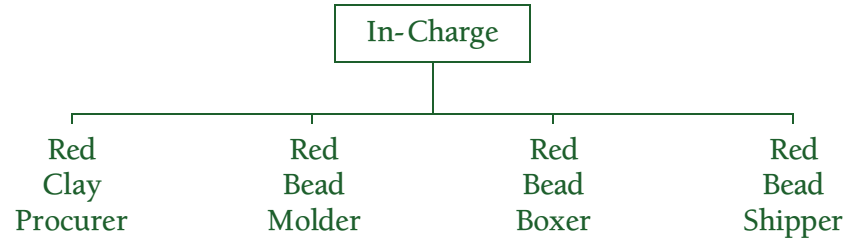
Or we would get:

It is not particularly important which pattern of org board we use so long as it handles the volume of beads.

If we only have one person in this "org," he would still have to have some idea of organization and a sort of org board.

If we have any volume to handle we have to add people. If we add them without an org board we will also add confusion. The organization without an org board will break down by overload and cross-flows and currents. These in conflict become confusion.

All a confusion is, is unpatterned flow. The particles collide, bounce off each other and stay IN the area. Thus there is no product as to have a *product* something must flow OUT.



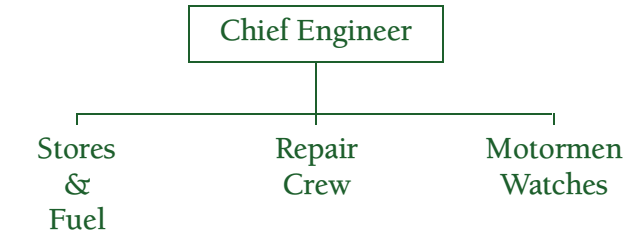
We can now note two things. We have some stable items. These are posts or locations. And we have flow items. These are things undergoing change.

So an org's positions change flowing particles.

Particles flow *in sequence.*

Things enter an org, get changed, flow out of an org.

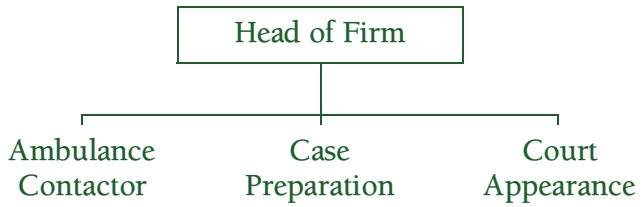
An org with one type of item only (red beads) is less complex than one with several types of items.



Any activity has a *sequence* of actions. It has to have stable points which do *not* flow in order to handle things which do flow.

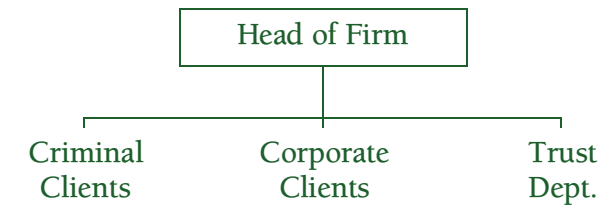
It is not necessary to have a stable terminal do only one thing. But if so then it also has a correct sequence of actions.

All this is true of an engine room or a lawyer's office or any organization.



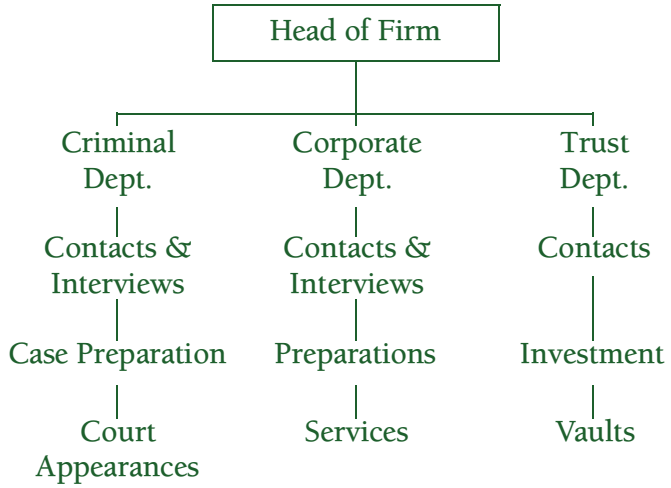
In an engine room fuel flows in and is changed to motion which flows out. Somebody runs the machines. Somebody repairs the machines. It may all be done by one person but as soon as volume goes up one has to plan out the actions, classify them and put them on an org board which the people there know and abide by or the place will not operate well.

This is done by dividing operation and repair into two actions, making two activities on the same org board.



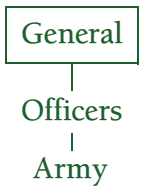
The Chief keeps the flows going and the terminals performing their actions.

In a lawyer's office we get different actions as a flow.

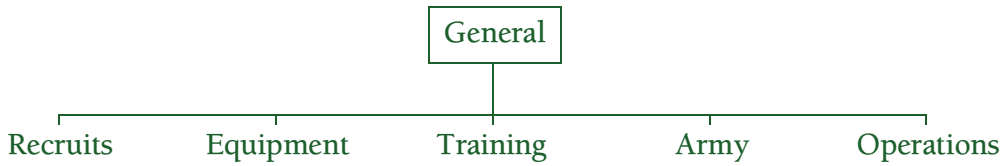


would be a flow pattern, possibly with a different person (with a different skill) on each point.

Or we could have a sort of motionless org board.



But if we did that we would have to put the motion in vertically so that flow would occur.



Org boards which only give terminals usually will not flow.

A typical army org board of yesteryear was:

When they got into a lot more men they had to have a *flow* board.

So one *organizes* by:

1. Surveying the types of particles.
2. Working out the changes desired for each to make a product.
3. Posting the terminals who will do the changing along the sequence of changes.

The board also must include a *recognition* of the types in (1) which *routes* the types to the *terminals* who *change* them and to a further *routing out* as *products*.

To be practical an org board must also provide for pulling in the materials, disposing of the product and being paid for the cycle of action and its supervision.

A company has various actions.

It is essentially a collection of small org boards combined to operate together as a large org board.

The basic principles you have to know to organize anything are contained in this policy letter.

To plan out *any* action one has to be able to visualize its sequence of flows and the changes that occur at each point. One has to be able to see where a particle (paper, body, money) comes in and where it leaves.

One has to be able to spot any point it will halt and mend that part of the flow or handle it.

A proper org board is a perpetual combination of flows which do not collide with one another and which do enter and do experience the desired change and which do leave as a product.

ORG SERIES 2

COPE AND ORGANIZE

It's perfectly all right to cope. One always must.

But one MUST organize things while he copes.

The mounting overload and overwhelm in an area comes entirely from cope-cope-cope without organizing also.

Example: You have to handle something for which there is no planned organization. Like a mob at a congress. You *can* cope. But if you don't take the first available instant to grab three guys and give them specific duties right then to mind doors and tickets, it all just gets worse and worse and the cope catches up as overwhelm.

Any old org bd is better than no org bd at all.

A good org bd well grooved in, duties well apportioned, permits things to smooth out and increase in volume without strain.

In a flood if you can channel the water you can handle the flood. If you just batter at water you drown.

ORGANIZATIONAL GENIUS IS COMPOSED ONLY OF ARRANGING SEQUENCES OF ACTION AND DESIGNATING CHANNELS FOR TYPES OF PARTICLES. THAT'S ALL IT IS.

Then you can handle flows and prevent stops.

So you must always organize as you cope.

National riots are just the inability of leaders to arrange sequences of action and designate channels for types of particles.

One area which was never organized became just an anthill of do-less useless motion.

If your in-basket is too high you cope and handle it AND ORGANIZE YOUR LINES for the future.

"I'm absolutely drowning . . ." is the same as saying "I can't organize worth a damn!"

ORG BD

Every exec has his own personal org bd. Really it's at least 21 depts.

But you don't have to go that fancy.

I had an org bd once that was 8 folders, each representing traffic from a major org, reports placed in it latest on top, a communicator who did the placing, a greeter who handled bodies and an inspector that was me. Just myself and one other. But it was an org. With that "org bd" I handled all the Scientology in the world at that time, lectured, researched and had ample time left over. It reduced full-time cope to a part-time job. Later 100 staff members (WW) replaced me as Exec Dir and I moved off post. They were all very busy but they didn't even know they had an org bd they were on, no individual operated his own personal org bd. Their cope and ignorance took the stats right on down. But they sure were busy coping!

The antithesis (opposite) of an org bd is confusion. The amount of confusion present doesn't add up to production, even though it is totally exhausting. The end product one wants is not exhaustion. The amount of energy expended does not measure production. Production is solely the amount of completed cycles that occur. The more they are planned in sequence and the better the different types are channeled the more production will occur.

So cope by all means but don't forget to organize a little each time you get a chance.

The end product of cope is drown.

The end product of organize is freedom.

REMIMEO

ORG SERIES 2-1

COPE

(Originally written by LRH for the *Apollo* OODs of 21 Sept. 70. Issued as an HCO PL on 12 Oct. 80.)

I've had an insight into what "cope" really is. It is the process of finding and correcting outpoints without ever discovering a WHY and without organizing any return to the ideal scene.

A coper goes "outpoint found — correct it; outpoint found — correct it; outpoint found — correct it." This perpetual cycle never finds or corrects WHY these outpoints. So it just gets worse and worse and worse.

If all one ever did was handle despatches one would really get into a mountain of overwork while stats stayed down.

The WHY we face now is absence of recruiting, lack of full hats with checksheets and packs.

The Why of that was failure to make the materials filed accessible and collatable. So it's a snake eats its tail. No hats then brought a condition of no data available in files. A true dwindling spiral.

And no hats traces to the introduction of ethics into HCOs and that it is easier to assign a condition than to compile or check out a hat. Hats went out when ethics came strongly in. Without ethics in HCO, HCO can only make stats recover by org form and hats.

Ethics has a role — after all else fails.

URGENT

ORG SERIES 3

HOW TO ORGANIZE AN ORG

Let us assume that you have an org to run (or any part thereof).

How would you organize it and get it to function?

1. You would count up and name the different vital actions necessary to functioning.
2. You would count up the persons needed for each function and give them the post names.
3. You would do a checksheet for each post to include its vital data.
4. You would collect the material of each checksheet into a pack.
5. You would recruit the minimal number to begin it, keeping in mind finance and solving that.
6. You would show one of them how to check the others out to get them trained.
7. You would then get the org running.
8. You would expand it by single hatting vital posts.
9. All the while you would cope with things as they came up.
10. You would add to checksheets and packs things learned while operating.
11. You would add posts as they were found needful.
12. You would never drop out the actions of recruiting, checksheets, packs and training.

Naturally the org would have to have a function that was valuable and would have to execute it or produce and be paid or it would not be viable (able to live).

All right. All that seems straightforward enough.

Now let's see how it could go wrong.

Foremost would be a failure to function or produce and a failure to get paid for it. This would cripple the activity and bring in inadequate operating funds, curtailing facilities and pay and making it undermanned, hurting its image and shutting off recruitment.

Recruiting to fill a new function could be incorrectly (destructively) done by using the production area as the recruitment pool. Also each time a portion was operating well, it could be used as a recruitment pool and emptied out and unmocked. This would destroy all training effort and injure the viability and reverse organization back to cope.

Or no recruitment could be done at all.

There could be no checksheets or packs.

There could be no training done even when checksheets and packs existed.

The checksheets or packs could be too short or unreal for the post. Or they could be too long or relate to another post.

The head of the org could fail to check out the heads of portions.

The heads of portions could fail to get their juniors hatted and checked out.

The org staff could be unaware of their belonging to the org and be unaware of its purpose and general products.

The problems as listed above could remain obscured and ethics could be substituted as an effort to get up production.

There are ten basic points that could go out. These are (1) recruiting (2) training (3) training on post (4) utilization (5) production of product (6) promotion of product (7) sale of product (8) finance (9) justice (10) morale.

It is assumed that the activity is worthwhile and the potential production valuable. Given that, the remaining ten points are the points where organization breaks down as these areas are the most aberrated in the society.

The fundamental outnesses, however, would be failure to recruit, to have checksheets and packs for each post, get training done on them and have new people on post serve on it in-training.

Let us suppose the head of an org or division never checked any junior out on anything.

Looking at standard functions, everyone would be posting and routing people except Dept 1, intended for that. Everyone would be handling comm except Dept 2, intended for that. Everyone would be inspecting and handling stats except Dept 3. And so on down the line. The place would be a dog's breakfast of total cope.

All right, let us say one *does* have a dog's breakfast instead of an org. How would one straighten it out?

One would cope to maintain some semblance of viability.

One would throw together an org board and post it and drill people on it.

One would throw together hats and get them worn.

One would continue to cope but now also force others to help the coping and cope themselves as semispecialists on their own posts.

Finally one would get checksheets and packs together for each post covering all its actions.

One would then get these checksheets and their packs trained in for each post fully.

Thereafter one would insist that executives made sure their juniors had checksheets and packs as their hats.

And one would continue to recruit as by this time the org would be expanding and it would become upset by undermanning and go downhill again.

One would watch the ten aberrated points as they go out very easily.

People gather up all sorts of weird solutions to running a disorganized org. "We need more experienced people"; "We can't produce so should be subsidized," are two common ones.

When people on post do NOT have grooved in hats they do goofy things. The goofiness is not confined just to their job functions. Lacking a purpose and not conceiving the org purpose they can go utterly astray and do things that are quite mad. Like tearing things up. Like breaking things. Like getting involved in goofy relationships.

You can detect an org where posts are not grooved in by the number of oddball things happening.

The way to put *this* sort of situation right is to start organizing as given in this rundown.

Working on organization as you cope, it will eventually make it come out right.

When it sags just come back to this rundown and it will all straighten out again.

HCO POLICY LETTER OF 22 SEPTEMBER 1970

REMIMEO
EXEC HATS
PERSONNEL HATS
ETHICS HATS

AN URGENT IMPORTANT AND STAR–RATE PL

PERSONNEL SERIES 9
ORG SERIES 4

HATS

HAT — A term used to describe the write-ups, checksheets and packs that outline the purposes, know-how and duties of a post. It exists in folders and packs and is trained in on the person on the post.

HAT TECHNOLOGY

"Hats" developed in 1950 for use in Dianetic orgs as a special technology. The term and idea of "a hat" comes from conductors or locomotive engineers, etc., each of whom wears a distinctive and different type of headgear. A "hat" therefore designates particular status and duties in an organization.

A "hat" is a specialty. It handles or controls certain particles in various actions and receives, changes and routes them.

A "hat" designates what terminal in the organization is represented and what the terminal handles and what flows the terminal directs.

Every hat has a product.

The product can be represented as a statistic.

Any job or position in the world *could* have its own hat. The reason things do not run well in a life, an org, a group, nation or the world is an absence of hats.

The reason why an org runs well when it does is hats.

Any protest of anyone against things not running right can be traced to lack of hats.

Any slump an org goes through can be traced directly and at once to an absence of one or more hats being worn.

HAT CONTENT

A hat must contain:

A. A *purpose* of the post.

B. Its relative position on the org bd.

C. A write-up of the post (done usually by people who have held it before relief and when so done it has no further authority than advice).

D. A checksheet of all the policy letters, bulletins, advices, manuals, books and drills applicable to the post. (As in a course checksheet.)

E. A full pack of the written materials or tapes of the checksheet plus any manuals of equipment or books.

F. A copy of the org bd of the portion of the org to which the post belongs.

G. A flow chart showing what particles are received by the post and what changes the post is expected to make in them and to where the post routes them.

H. The product of the post.

I. The statistic of the post, the statistic of the section, the statistic of the department and division to which the post belongs.

STAFF HAT

There is also a general staff hat.

This hat contains:

a. The overall purpose of the org, its aims, goals and products.

b. The privileges or rewards of a staff member such as auditing, training on post, general training availability, pay, vacations or leave, etc.

c. The penalties involved in nonproduction or abuse of post privileges or misuse of the post contracts.

d. The public relations responsibilities of a staff member.

e. The interpersonal relations amongst staff members including courtesy, cleanliness, attitudes to seniors and juniors, office etiquette, etc.

f. The MEST of posts generally, its papers, despatches, files, equipment.

g. The comm and transport system of the org.

GRADIENT SCALE OF HATS

A "gradient scale" means "a gradual increasing degree of something." A non-gradient scale would be telling someone to enter a skyscraper by a 32nd-story window.

Thus there is a gradient scale of organizing.

A key to this is found in the *Problems of Work*'s theory of confusion and the stable datum.

One in actual practice has to cope while organizing.

COPE means to handle whatever comes up. In the dictionary it means "to deal successfully with a difficult situation." We use it to mean "to handle any old way whatever comes up, to handle it successfully and somehow."

IF YOU *REMAIN* IN COPE, THE DEMAND TO COPE INCREASES.

In that you have the key to "exhausted executives" or staff members. You have why the president of the US ages about 20 years in one term of office as you can see by comparing dated photographs of past presidents. He is totally on cope. His government has an org board that looks like a pile of jackstraws. He has no hat. His staff have no hats. His government departments have no hat. The technologies of economics, law, business, politics, welfare, warfare, diplomacy have been neglected or lost (they *do* exist to some extent).

The guy is on total cope. And the post has been on total cope since it was created as an afterthought by the Constitutional Congress that began the post in the eighteenth century. Even what it says in US civics textbooks is not found in practice.

So "difficult situations" are the order of the day and are handled by special actions and appointments.

The people who *should* handle them haven't got real hats.

This is all catching up with the country at this writing to such a degree that the citizen cannot benefit from a stable society or social order. The country looks more like a war of insurgency.

In other words departures from hats has led into total cope and it is steadily worsening.

Any organization put in by one political party is knocked out by the next incumbent, and who could totally organize a country in 4 years? (The term of a president.)

Yet it is hanging together some way and some way meeting increasing demands and pressures.

I have stated this in a large example so that it can be seen in a smaller unit.

To handle this one would first have to want to straighten it out and then assemble the tech of admin to straighten it out. And then one would have to begin on a gradient scale of org bd and hats.

A cope sort of hat would be tossed-off orders to some other people on staff who have some title of some sort.

Along with this would be a posted org bd that has little to do with duties actually performed and used by a staff that doesn't know what it is.

One begins to move out of cope (as given in other series) by putting an org board together that labels posts and duties and getting people on them to handle the types of particles (bodies, mailings) of the org.

The next action would be brief write-ups of the posts and their duties and checking people out on them.

Actually if you only got to the middle of the last paragraph with an org the executives would remain in cope. So much know-how would be missing in the org's staff that every rough bit would shoot up to the executive for special handling. And that is *cope*.

Hats only in this far is not good enough as it still takes a genius to run the place.

The next gradient scale is to get the hat to contain:

i. The post write-up itself,

ii. The theory and practical necessary to run it.

This is done by a preparation of checksheets of data and a pack matching it for key posts.

Naturally the org bd now has to become more real and staff has to be checked out on it.

Then hats as post checksheets and packs are extended to the rest of the staff.

The mechanisms of training have to exist by this time.

Seniors have to be made responsible that every junior below them has a hat consisting of write-up, checksheet and pack.

Meanwhile one continues to cope.

Gradually, gradually staff begin to know (through checkouts) their hats.

New staff coming on are grooved in better.

Cope begins to diminish and the organization tends to smooth out.

Here and there competent handlings begin to show up brightly.

Now we find a new situation. With everyone throwing together checksheets and packs for staffs we find nonstandard checksheets. Some messenger has to do the full checksheet of the HCO Division pages and pages long. The HCO Sec has a checksheet with just 10 items on it.

So a central authority has to standardize post checksheets and survey and put in overlooked bits of data.

But that is way up the line. The org long since has become smooth and prosperous.

So that is the gradient scale of getting in hats.

EXPERTS

Here and there you find an area of special expertise in an org where the expertise is so expert in itself that it obscures the fact that the person does not also have a full post hat.

A lawyer would be a case in point. It takes so long to learn law in some law school that an org executive can overlook the fact that the *post* hat is missing. Org policy on

legal matters and staff hat remain unknown to this legal post AND JAM IT UTTERLY. This came to light when a whole series of cases was being neglected because the legal staff member, an excellent lawyer, did not know how to make out a purchase order or that one could or should. Investigation found *no* post or staff hat. Only a legal degree.

Orgs continually do this with auditors. They are technical experts in *auditing*. So they get assigned to posts in the HGC WITH NO HAT. Backlogs occur, things goof up. Tech fails. All because it is overlooked that they are PART OF AN ORG and need staff and post hats and need to be trained on them.

Worse than that, a highly classed auditor is often put on an admin post without hat or training for it.

You would not take an admin trained person and without further training tell him to audit. So why take an auditor and tell him to handle an admin division?

Without his post write-up, checksheet and pack FOR THE POST and without training on it, the person just isn't qualified for it no matter what *other* line he is expert in.

It is great to have an expert who has been specially trained in some profession. But lawyer, engineer or public relations, he must have his hat for the *org* post and be trained on it or he will goof! Yet one won't suspect why that area is goofing because "he's a Class VI isn't he?"

UTILIZATION

Personnel can recruit madly, answering every frantic demand for personnel and yet HAVE THEM ALL WASTED for lack of full hats and full training on those hats.

An investigation of blows (desertions) from orgs shows that lack of a grooved-in hat was at the bottom of it.

People come on a job. It is at once a great mystery or an assumption of total know — one or the other.

Either one continued leads them into a state of liability to the org.

People who don't know what they are doing and people who don't but think they do are both NONUTILIZED PERSONNEL.

Pay and prosperity for the rest of the staff will go down unless this is remedied.

The whole org can sag and even vanish under these conditions.

So Personnel has a vested interest in hats being complete and staff trained on them. For Personnel people cannot possibly cope with "no pay so can't hire anyone" and "no people so can't produce."

The answer is H-A-T-S.

And a hat is a write-up, a checksheet and a pack.

And the staff member trained on them.

ETHICS

When a person has no hat he lacks purpose and value.

When he has no purpose and value he not only goofs, he will commit crimes.

It is apparently easier to hit with ethics than to program and give someone a full hat and get him trained on it.

Police action is not a substitute for having purpose and value.

This is so fundamental that one can even trace the unrest of a nation to lack of purpose and value. A huge welfare program guarantees crime and revolt because it gives handouts, not hats.

Even a field Scientologist should have a hat.

By doing only this over the world we would own the planet as in an expanding population individual purpose and value are the most vital and wanted commodities.

If there are no real hats there will soon be no money of any value and no bread!

SUMMARY

ANY HAT IS BETTER THAN NO HAT according to the way a thetan seems to think.

But be that as it may, the downfall of any org can be traced directly and instantly to no recruiting or no org board, no hats or unreal hats or no training on hats.

The sag of an org can be traced directly to lack of hats and lack of training on hats.

The overload of any post can be traced directly to lack of an org bd and lack of hats and no training on hats.

The way out is to organize the org board and hats while you cope.

If you do not, your cope will become an overwhelm. If you do, your burden will lighten and your prosperity increase.

It took 13 months of hard work and 20 years of org experience to learn that given a product lack of HATS was *the* WHY of departures from the ideal scene and that working toward providing full complete HATS was the way to get back toward the ideal scene.

HCO POLICY LETTER OF 26 SEPTEMBER 1970

REMIMEO
EXECUTIVE HATS

ORG SERIES 5

ORG BOARD CUTATIVES

The most serious blunder in *re*-doing org boards is losing past functions off them.

"Cutative" is an invented word to mean the impulse to shorten or leave out or the thing left out.

THE RULE IS: ANY MAJOR FUNCTION, ACTION OR POST LEFT OFF AN ORG BOARD WILL WRAP ITSELF AROUND THE IN–CHARGE LIKE A HIDDEN MENACE.

As the function is not *expressed* it is not recognized. But it forces itself upward and can swamp an activity if not done.

Thus we get the laws:

1. Activity functions must all be expressed on the org board.
2. All functions below a personnel on an org bd are the responsibility of that personnel, no matter what size the staff may be.
3. Functions omitted will act as invisible overloads.

EVOLUTION OF ORG BDs

Usually the first org board ever done for an activity is a dream-up. It is seldom real but better than no org bd at all.

Experience then refines it.

Some functions on it are not related to it, are unreal.

Some functions not on it rise up to haunt and overload the in-charge.

Actions done by an executive that are not on the org board in departments get posted like small flags opposite the executive's name. (Like legal, VIP greeting, etc.)

After a while these little flags are too many.

A reorganization occurs and the flags are put down into departmental functions. This gets them off the executive's neck and gets them manned up.

So far so good. Now what happens is a catastrophe. A new executive who has no experience with this org bd DREAMS UP A NEW ONE. This is out of sequence in evolution. He is treating the place as though it had NO org bd simply because he doesn't know the existing board.

This gives us the *cutative*. He drops functions off the board. These now wrap around his neck. The place stalls.

YOU HAVE TO KEEP EVERYTHING ON THE ORG BD THAT WAS EVER ON THE ORG BD EVEN IF IT WAS 3,000 YEARS.

SALVAGE

It often occurs that one has to do a full, complete salvage of an org bd.

There is absolutely no reason except the org bd writer's laziness not to put everything on an org bd!

There is a rule about posting an org bd. You don't post a name for every post. That is folly. You post by workload.

All the functions below a person are handled by that person. If they are too much you put in a new name and person on a heavy load function.

So why do a cutative? It means no more people. It just means more space and tape. What's saved but elbow grease? What's lost? The whole org can be lost and become nonviable.

Example: SH original board had ten major divisions on it. They were just functions really. They were the ten sources of income *before* SH trained or processed anyone. Some years ago I tore the place apart looking for that old org bd. It was evidently thrown away. Today SH does not have but *one* of those income functions! Nine have been lost! It added training and processing, it lost nine functions capable of supporting it. They should be looked up in the 1959–1960 accounts records, the old invoices analyzed and gotten back and put on the WW org bd and manned. This is regardless of what is already on the org bd.

Other functions lost off that and the SH org bds should be posted back on them and at least held from above or double- or triple-hatted.

Example: DC which had the original six-dept org bd should recover those posts and put them on the nine-div org bd so early policy would make sense.

Example: London should recover its earliest org bds and put their posts and functions on its current org bd.

There comes a time when early org bds have to be salvaged and reposted on existing org bds.

BECAUSE THOSE FUNCTIONS ARE STILL THERE AND MOST OF THEM GONE INVISIBLE.

Example: A Division 2 org bd asked to be redone threw away 50 percent of its functions and posts, was dreamed up brand-new off a division already caved in by loss of performance. The excuse was "other activities now do these." Published, this org bd would have driven its executive mad with omitted duties that would come to him as invisible overloads.

The "We don't do that now" is like what once happened to tech. One could say, "Maybe you think you don't do it now but the function is still there hidden. It was found once. Now you've lost it again."

OLD EMPIRES

The Egyptian, Greek and Roman Empires still try to operate! I've checked it. The late British Empire may be gone on the British org bd but it will still function without expression until it kicks England's head in. The British public shovels money out by the scoopful to an empire that doesn't exist!

Trying to kill an org takes years and years and years and it still tries to survive.

When one takes responsibility for a function or area it still tends to persist.

It is an odd phenomenon. The third dynamic track is that way. Changes later on the track (short of auditing individuals) do not change earlier circumstances.

A thetan's intentions get very pale perhaps but a thetan never really gives up.

All this expresses itself on the subject of org bds.

One can also willfully disregard an existing board, dream up a new board that does not express the functions and get into real trouble.

A NEW LOOK

Examining this subject of org bds in the light of very current experience with asking people to redo them, these facts have emerged.

It gives us a new look.

The next full Scn org bd issue you see will have on it all functions of which we have any trace *and* the nine-division board we are using.

The new board will have nine divisions. It will also include all past titles and functions in addition to all current titles and functions with the past titles in parentheses.

Many org bds of other activities have never become expressed at all and have left a tangled history. The US still hangs flags around the Office of the President and one hears "The Executive Branch is usurping the power of Congress." Congress once had all those functions but didn't put them on its org bd. They still do them but lost the titles to the president. Thus an appointee despotism rises in place of a democracy. It all goes back to a lost congressional org bd.

It is necessary for a people or a staff to:

a. Have an org bd,

b. Know the org bd,

c. Have the org bd express the total functions and duties that have ever been held by any post even including the flags of yesteryear duly dated.

Don't cut functions off an org bd. If they have become known they have been found. Why lose them?

One can rearrange flow patterns.

One cannot abandon living functions on an org bd.

It's only the unknowns on an org bd that get anyone overloaded, confused or in trouble.

So why not keep it visible?

CUTATIVE PRICES

HCO PL of 27 Apr. 65 II, PRICE ENGRAM, is fully valid and must be followed. It explains why price cuts damage orgs.

Price cuts are forbidden under any guise.

1. PROCESSING MAY NEVER BE GIVEN AWAY BY AN ORG.

   Processing is too expensive to deliver.

2. BOOKS MAY NEVER BE GIVEN AWAY BY AN ORG OR BY PUBS ORG.

   They are too expensive to manufacture.

3. FSM COMMISSIONS MAY NEVER BE PAID ON DISCOUNTED OR CUT–RATE ITEMS.

   If an FSM can't sell for full value he does not rate any commission.

4. SCHOLARSHIPS FOR COURSES ARE LIMITED TO INTERNSHIPS, HSDC AND ACADEMY LEVELS.

5. COURSE SCHOLARSHIPS ONLY MAY BE OFFERED FSM ON CONTEST AWARDS.

6. SCHOLARSHIPS ARE ONLY AVAILABLE TO WORKING FSMs OF PROVEN SELECTEE SUCCESSES.

7. ALL SCHOLARSHIPS AND AWARDS OUTSTANDING TERMINATE IF NOT TAKEN BEFORE 1 JANUARY 1971.

8. FSM COMMISSIONS ARE PAID ONLY ON THE ARRIVAL OF A STUDENT OR PC, NOT ON RECEIPT OF THE FEE.

   Advance payments are sometimes refunded.

9. ONLY FULLY CONTRACTED STAFF IS AWARDED FREE SERVICE, AND THIS IS DONE BY INVOICE AND LEGAL NOTE WHICH BECOMES DUE AND PAYABLE IF THE CONTRACT IS BROKEN.

10. FSM BONUS AWARDS TO ORGS MAY ONLY BE DELIVERED TO CONTRACTED STAFF MEMBERS OF THAT ORG.

ORG SERIES 7

HATS AND COUNTER–EFFORT

When you are trying to get somebody to do something he should do, you are in effect trying to get him to wear his hat.

In trying to get things done, you often feel you are running into "counter-effort" (contrary action or effort to your action or effort).

The most usual counter-effort is NOT willfulness or mutiny or out-ethics. Most people consider these are the reasons they get opposition to worthwhile actions.

The most usual counter-effort is *lack of a hat,* defining a hat as a write-up, checksheet and pack on which the person is trained.

It looks like willful stupidity, waywardness, laziness, mutiny, antagonism or what have you and can amount to any or all of these.

Whatever the reason for it may be, it must include lack of a hat.

The variations are enormous, almost infinite.

Example: Mr. A is trying to get Mrs. A to be a good wife. Mrs. A is in outright mutiny. Now, it could be that Mr. A does not have or know his husband hat or Mrs. A has no wife hat or the neighbors or friends don't have neighbor or friend hats or Mr. B has no social hat and is trying to estrange Mrs. A or he has no husband's hat of his own; but whatever it is, it is a matter of hats. SOMEBODY (or all of them) in this is not wearing their hat.

I had someone in marital trouble look at me thoughtfully once and say, "I don't have *any* idea what *are* the rights or duties OF a wife."

Example: A Course Supervisor having trouble getting a student to study. He pleaded and argued and wore himself out.

He never realized this student DID NOT HAVE A STUDENT HAT. He could have saved all his energy spent in arguing and applied it to making up a student hat and getting *it* assembled and studied and would have gotten somewhere.

ORG BD

So we draw up an org board for an activity for several people.

It is all correct as to function and flows.

We put the names of the several people on it where they seem to be fitted.

The activity doesn't go.

So we explain and drill the org board on the people.

It comes up to a flubby sort of cope.

The missing point now is HATS. Each one has to have and know his own hat and something about the hats of others.

Things will promptly get much better! The activity and the interpersonal relations and the lives of these people are greatly improved.

Personally they are running into much less cross-flow and confusion. So they have a happier time, less effort and more production.

A badly organized, badly hatted, badly trained group is at each other's throats continually. To get anything done at all they have to operate at the level of correction instead of production.

Any ripple of emergency in such a group operates as a major impact.

PROGRAMS

There is still a missing element when one has org boarded and hatted and specialist trained an activity. This is PROGRAMS.

The sequence of flows and the changes or actions at each point plotted against time are in fact the major sequences and programs of a group.

MANAGEMENT SUCCESS

Given a desired product a fully successful management can only be founded on the actions inherent in:

1. A good org board,
2. Hats as write-ups, checksheets and packs,
3. Hats trained in,
4. Sequences and programs known and followed.

IT IS FAR, FAR EASIER TO WORK ON AND ACCOMPLISH THOSE FOUR THINGS THAN IT IS TO COPE AGAINST THE COUNTER–EFFORT GENERATED WITHOUT THEM.

Naturally, while getting this done, anyone has to cope to keep things going.

"Single-handing" means to handle things by yourself.

You can single-hand when you are all alone or you can single-hand in a large group that is supposed to be working or helping.

When only one man, senior or junior, is doing all the controlling and work of an activity, he is said to be "single-handing."

The term derives from the sea (like so many English words). Single means "one only" and "hand" means a sailor. "Hand*ing*" is the verb form of "single-hand."

No other activity expresses so well the idea of "one man working" or "one man controlling."

It is of course derogatory to others who are around and not working.

The phenomenon comes about by having non-org boarded, unhatted and untrained people.

Now the oddity of it is that it can occur (a) when there are other people who are also supposed to be working, (b) when there is an org board, (c) when there are hats and (d) when programs exist.

This of course looks like "bad morale," "apathy," even "mutiny."

The missing elements usually are:

a. The other people don't know the purpose of the activity or what's really going on.

b. The org bd is unknown to them even when it exists.

c. The hats are not checksheets and packs and have not been trained in.

d. The sequences or programs that should occur are not drilled in and if they were the no-hat situation would wreck them.

The point is even more amazing when a group with a purpose and an excellent potential product WILL BE POOR AND WILL FAIL if org bd, hats and sequences and programs are not fully known and drilled.

Groups are like that.

This is why man and his activities succeed only in the presence of huge affluences or extraordinary personal leadership.

Lacking org bds, hats, training, programs *that he knows and can do,* man flounders.

Leaders who are not org boarded, hatted and trained and programed can make a fantastic mess out of a formerly well-organized group.

It takes some doing. But no one can knock the known org board apart faster than a senior. No one can knock off hats easier than someone in authority who does not himself know they exist.

Nero and his ilk destroyed the whole Roman Empire. That civilization was about as well org boarded and hatted as any civilization on the planet in recent millennia. Nero thought he was a lute player and composer and charioteer. These were the only hats he ever wore aside from that of murderer.

A few emperors like him and that was that.

The Christians had an org board, member hats and staff hats, post hats of a sort and constant training. And that was the end of the Roman Empire and the beginning of the *Holy* Roman Empire.

Way up in Pope Alexander the Sixth's time (the days of Lucrezia Borgia) when bishoprics were for sale and the member hats were forgotten, the Holy Roman Empire failed.

So there is plenty of history and example, even though the full tech was not even developed. You can see the dim counterparts of org boards and hats weaving their way through all man's yesterdays.

The history of the world is not written by wars and violence. It is written against an unseen background of beneficial products, org board, hats and programs.

The fantastic administrative skill of Arthur Wellesley (the Duke of Wellington) and the rigid org bd of Nicholas of Russia defeated Napoleon whose only skills were military genius and personal leadership and luck.

So when the head of something does not know about org bds and hats and programs, he can single-hand things perhaps into temporary power but will wear himself out with cope and soon decline.

One can't just run things. One has to put something there and the something is a desirable product and org bd, hats and programs and see they are grooved in properly.

And looking over history the most valuable product of an executive is holding the form of his org and providing his staff members with hats and programs well grooved in.

It takes so much more time and effort to build up an org in terms of org bd and hats and get it to hold its form that one might not at once see its benefit. Trying to get a result without also building an organization inevitably winds up in single-handing, coping, overwhelm and eventual defeat.

The *right* answer is single-hand while you train up your people.

For one will wind up single-handing any post he has not org boarded and hatted and programed.

And that is true of even a junior member of a staff. If HE doesn't hammer away to get in org bds and hats and sequences and programs, HE will wind up single-handing all his section — while they stand around making life miserable with inefficiency, goofs and flubs and obvious counter-effort.

It isn't labor against management or the people against government. One or the other or both aren't on org bds and aren't wearing their hats.

And in an interdependent society or a complex activity the final result of no org bd, no hats, no programs known is chaos. And very unpleasant chaos as well.

ORG SERIES 8

ORGANIZING AND PRODUCT

Disorganization gives a poor product.

Organization (providing tech exists to make the product) will produce a good product.

If a product is poor or spotty one must:

a. Organize

b. Make the tech available and known.

You can literally have mobs of people working and excellent production tech and get a horrible product.

The missing ingredient is organization.

Organization consists of a real and functional org board, hats consisting of checksheets, packs and manuals and training of this material.

The most used org board is the "hey you! org board." In other words just tag anyone to do anything.

This guarantees bad production and a lousy product.

One can have an org board that isn't real and get a "hey you! org board."

Or one can have a good org board that isn't known and get a "hey you! org board" in actual practice.

A whole org can be org boarded and hatted and trained and yet shatter when an untrained senior turns it into a "hey you! org board." This is easily the commonest cause of org collapse.

LOSING AN ORG BOARD

When an org board leaves out known vital functions these tend to wrap around the neck of the in-charge as unknown items of irritation.

The commonest fault in *re*-drawing an org board is throwing the old one away and without looking at or getting a full inspection of the actual functions being done,

dreaming up a brand-new board. This produces a delusory situation. It is in fact a disassociation of the real work and the org board delusion.

MINIMUM FUNCTION

A post tends to dwindle down to the "irreducible minimum function."

A mail clerk will distribute mail as that is visible to others. Logging it is less visible. Properly sorting it is less visible.

If "receiving, logging, sorting and distributing" are left off the org board and "mail distribution" is all that is left on it, the other functions tend to vanish and the post slides to "irreducible minimum" of just grabbing and slinging out mail.

A galley org board can be deficient and carry only "food," or "cook," you'll get "food" and that's all. It will possibly be very lousy food as the org board is down to an irreducible minimum. Says "food" so they just sling out food any old way of any old kind. Bad product. The answer is to organize it. What *are* the steps in sequence that it takes to get good food served and the place cleaned up? If they are *all* on the org board as functions you have the SEQUENCE of actions expressed as functions which can be posted and delegated as duties.

OUT SEQUENCE and OMITTED HATS are the commonest fault in programs and org boards. (See Data Series.)

One person may have 35 separate hats.

If so, he needs 35 hat folders, checksheets and packs and 35 baskets or compartments for the flows.

Further, the hats must be in sequence of flow where they relate to one type of particle.

Thirty-five hats is large but many an executive unknowingly wears more. And the ones he doesn't see are his areas of upset.

The smaller the number of people in an activity, the more hats each has.

One girl holding down seven branches of an office finally got untangled just by having seven baskets, one for each branch, and working a stated time on each one each day. She sorted the inflow into the baskets by branches and then did them in rotation. That made an org board of baskets. She suddenly got production where she had had just despair and chaos.

SUMMARY

To improve an existing product, ORGANIZE.

ORG SERIES 9

ORGANIZ*ING* AND HATS

"Org bd" is actually an abbreviation not for an organization (noun) board but an organiz*ing* (verb) board.

The org bd shows the pattern of organizing to obtain a product.

A board then is a flow chart of consecutive *products* brought about by terminals in series.

We see these terminals as "posts" or positions.

Each one of these is a hat.

There is a flow along these hats.

The result of the whole board is a product.

The product of each hat on the board adds up to the total product.

WORKING IT OUT

When asked to work out an org bd (or when the board there is doesn't work) one might think the task very difficult.

In studying this subject so as to be able to communicate it, I made several small breakthroughs in the subject itself.

Several questions on this can be very easily answered now.

Does an org bd have any value?

Yes. Without an org bd there is no group product, there is only a mob.

Yes. When there is no org bd there is much greater effort involved in getting anything done.

Yes. The waste of people involved in no org bd and the loss of product justify any amount of effort to work out, make known and use a proper org bd.

Man instinctively uses an org bd and protests the lack of one. The rawest recruit walking aboard a ship assumes the existence of an org bd, if not a posted one, at least a known one. He assumes there will be somebody in charge and that different activities will be under different people. When there is no known org bd he protests. He also feels insecure as he doesn't know where he fits into this organization.

Almost all revolts are manned by people who have been excluded out and are not on the country's org bd. This is so true that the ridiculous circumstance recently occurred in the US. The president found he had "professional relief receivers." Certain people had assumed the status of "government dependent" and were giving this as their profession. It was of course a post of sorts. And because it wasn't admitted as a post by the government there were some riots.

The effort to belong or to be part of is expressed by an org bd. A person with no post is quite miserable. A person with an unreal post feels like a fraud or a mistake.

Morale then is also considerably affected by the quality of an org bd or its absence.

The overall test for the group, however, is its viability. Viability depends on having an acceptable product. Groups which do not have an acceptable product are not likely to survive.

The volume and acceptability of a product depends in no small measure on a workable known org bd. This is true even of an individual product.

An individual or small group, to get anywhere at all, requires a very exact org bd. The oddity is that the smaller the group the more vital the org bd. Yet individuals and small groups are the least likely to have one. Large groups disintegrate in the absence of an org bd and go nonviable in the presence of a poor one.

The quality of a product, usually blamed on individual skill only, depends to an enormous extent upon the org board. For example, one disorganized mob that was trying to make a certain product was worked to death, harassed, angry at one another and had a wholly unacceptable product at about twice the usual cost; when organized to the degree of a third, still without proper schedules, still largely untrained, they began to turn out an acceptable product at about half the effort—so even *some* organization worked.

The product volume and quality depends utterly and totally upon the org board and hats and their use. You can train individuals endlessly but unless they are operating on a workable org bd they will still have a poor or small volume product.

The traditional reliance of British intelligence on star agents instead of organization cost them (along with misused PR) their empire.

Lack of a known and real org bd can spell failure. And lack of knowledge of the *subject* of organization has to be substituted for by pure genius at every point.

Thus to make anything at all, to improve any product, sustain morale and distribute work equitably and make it count, one has to have a real and a known org bd.

So how do you make one?

An org bd is made up of hats.

The definition of a hat is the "beingness and doingness that attains a product."

Let us take a train:

The engineer wearing his engineer hat has the title of engineer. That's the beingness.

He accepts orders, watches signals and general conditions, operates levers and valves to regulate the operation of his engine and to start, change and stop. That's the doingness.

He safely and on schedule moves the train passengers and/or freight from one location to another. A moved train and load is the product.

So how do we find out there is a hat called engineer?

As people are continually accepting or viewing already existing posts, when you ask them to dream up an org bd they at first may not realize that you are asking them to *invent* the correct posts.

They don't have to invent "engineer." Everybody knows "an engineer runs a train."

So if you didn't know this? You'd have to figure it out.

One would do it this way. One would have to think along these lines:

The idea comes about because of a concept that people and goods have to be moved over distances on land. Or that a new area building up has to have transport of people and goods from and to it.

Ah. This will be viable in an economic framework because people will pay to be moved and pay for their goods to be moved.

Trains do this.

So let's use trains.

Arranging finance (or by prepayment) and obtaining a franchise for a right of way, track is laid, rolling stock and stations and roundhouses are built.

Now it emerges that somebody has to drive the train. So somebody had better be hired to drive the train.

So there comes into view the *post* of engineer.

How do we know this? Because we have to have a *product* of moved people and goods. That was what we were trying to do in the first place.

Therefore, the engineer hat.

So supposing now we did not have any org bd at all.

The engineer hat would be the only hat. So he collects fares, runs stations, fixes his engine, buys fuel, loads the cars, sells stock . . .

Wait a minute. If the engineer did all that the following would happen:

1. He would be exhausted.
2. His temper would be bad.
3. He would have machinery breakdowns.
4. He might have wrecks.
5. The railroad property otherwise unhandled would disintegrate.
6. He would have a low volume of product.
7. His product would be uneven and bad as he could maintain no schedule.
8. There would shortly be no railroad.

Now let's go wog and "solve" this.

Let's appoint a person for each station and say "There we are!"

Well, it would still be a mess.

So let's hire more engineers and more station agents and more engineers and more station agents . . . and wind up with a confused mess, a huge payroll and a lousy product. That's how governments do it. And it is notable that current governments have no product but disaster.

No, we have to solve this in quite another way.

We do not get anywhere and we will not get a sensible org bd and nothing will work or be viable unless WE COUNT THE PRODUCTS CORRECTLY AND DEVELOP HATS TO ATTAIN THEM.

When we have done this we can arrange the hats on an org bd so there is a *flow* and command channels and communication channels and we've got an org bd.

You cannot work out an org bd until you have counted products!

As volume increases you estimate the products before the final product and hat those.

Quality of final product depends on a real org bd and hats, both complete, real and trained in and the functions DONE.

Let us see now how you break down a *final* product into the products which, put together, comprise it.

We have the final product of a railroad — viably moved loads. How many lesser products go into the big product?

There is a matter of machinery here. Any machine has *two* products: (a) the machine itself in good operating condition, (b) the product of the machine. A repairman and

machine shop man and a roundhouse keeper each has a product under (a). That is just for the machine, the engine.

Under (b) we have what the machine itself produces (hauled trains in the case of an engine).

Here we have then two major products — and these break down into lesser products, earlier in sequence to the final product.

There is even an earlier product to these — bought engines. And an earlier product to that — finance for equipment.

As for the load itself, a delivered load, accepted by a consignee at the end, as you back up the sequence you will find a product — stored freight. And before that — unloaded freight. And before that — moved freight. And before that — loaded freight. And before that — freight assembled for shipment. And before that — freight contracts procured. And before that — advertising placed in public view. And before that — surveys of public freight requirement. And before that — survey for activities requiring freight service.

Each one of these products is a hat.

Surveying this again we see there's no charges or money involved so no economic viability. Thus we have a product, money made. This has earlier hats of course. The bewilderment of some people (and a lot of executives) who gape at a no-dough situation is laughable. They aren't product-minded. They think money falls into a company's lap or out of a TV set. They can't think the product sequence necessary to obtain money. So they go broke and starve. There are always a lot of prior products to the product MONEY. Fixated people just fixate on money itself, have no product sequence and so go broke or are poor.

Someone has to have a desirable product that is sold for more than it cost to produce and has to sell it and deliver it to have money. Money even makes money. And even a pool of money has to have a product sequence or it vanishes.

Even in socialism or communism the how does it support itself question must be understood, answered, its product sequence identified, org boarded and hatted. In such a moneyless society the org boarding has to be much tighter as money adds flexibility and lack of it as a working factor makes problems that are hard to solve.

ORGANIZING

In order to organize something one only has to:

1. Establish what is the final product.
2. Work backwards in sequence to establish the earlier products necessary to make each next product and which all in a row add up to the final product.
3. Post it in terms of vertical greater and greater completeness of product to get command channels.
4. Adjust it for flows.

5. Assign its comm sequence.
6. Work out the doing resulting in each product. Write these as functions and actions with all skills included.
7. Name these as posts.
8. Post it.
9. Drill it to get it known.
10. Assemble and issue the hats.
11. Get these known.
12. Get the functions done so that the products occur.

This is what is called "organizing."

As a comment, because railroads *didn't* fully organize, their viability decayed and they ceased to be so used.

Railroads think it's the government or airplane rivalry or many other things. It isn't. They had too many missing hats, were actually too disorganized to keep pace with the society's demands, ceased to fully deliver and declined. In fact there has never been a greater need of railroads than today. Yet, disorganized, badly org boarded and hatted, they do not furnish the service they should and so are opposed, government regulated, union hammered and caved in.

To have a quality product, organize!

To raise morale, organize!

To survive, organize!

EXEC HATS

ORG SERIES 10

THE ANALYSIS OF ORGANIZATION BY PRODUCT

The different products involved in production are:

1. Establishing something that produces. (Product 1)

2. Operating that which produces in order to obtain a product. (Product 2)

3. Repairing or correcting that which produces. (Product 3)

4. Repairing or correcting that which is produced. (Product 4)

Example: A typewriter is manufactured and located on a desk. This is establishing something that produces as in (1). A typist operates or runs the typewriter which thus produces typed sheets, stencils, etc., which are the product produced. This satisfies (2) above. The typewriter from various causes eventually requires repair in order to continue to produce. This satisfies (3). The correction of things typed would satisfy (4).

These are the four basic PRODUCTS involved in production.

Thus there are really four basic products necessary to a production activity. These are:

1. The established machine

2. The machine's product

3. The corrected machine

4. The corrected product

That makes a minimum of four products for any production cycle.

Three major factors govern every product. These are:

A. Quantity

B. Quality

C. Viability

Quantity would be an acceptable, expected or useful volume.

Quality would be the degree of perfection of a product.

Viability would be the longevity, usefulness and desirability of the product.

As *each* product in the four listed above has *three* factors in each product, there are then twelve major points (4 x 3) regulating production.

Product 1 — Establishing the typewriter, contains:

i. The quantity of typewriters established

ii. The quality of the typewriters established

iii. The viability of the typewriters established

Product 2 — The product of the typewriter (typed things) also has three:

iv. The quantity of the typed things

v. The quality of the typed things

vi. The viability of the typed things

Product 3 — The repair of the typewriter itself also has three factors:

vii. The quantity (amount) of the repair

viii. The quality of the repair

ix. The viability of the repair

Product 4 — The correction of the thing produced.

x. The quantity (amount) of the corrected product

xi. The quality of the corrected product

xii. The viability of the corrected product

Thus to get a product "typed things" there are actually twelve separate factors.

This applies to all machinery. For instance, there is the generator that produces and there is the thing (electricity) produced by the generator. There is the repaired generator. And there is the corrected electricity (such as reducing its voltage or converting it).

Now if you did not know that you were handling twelve factors in producing electricity the tendency would be to "just run the generator" and ignore the actual factors governing production.

The results of this would be total operation only. The generator would soon go to pieces. The electricity furnished would vary all over the place and blow out other equipment. There would be no funds to repair or replace the generator when it broke down. By paying little attention to products (as the wog world often does) or by shifting their importances — giving total importance to running it — there would

soon be *no* viability at all. The end result would be two wrong products — scrap metal that was once a generator and no electricity.

Now, surprise, surprise! An organization composed of people is influenced by these same things!

Org Product 1 is putting it there.

Org Product 2 is what the org produces.

Org Product 3 is the repair of the org.

Org Product 4 is the correction of the org's product.

If we do not know these products and factors exist, continual mistakes can be made just as bad as just running a generator. Instead of the desired final product which is offered and sold and delivered, we get scrap paper and insolvency.

To establish an org one has to put one there. This requires a desirable and economic product of the org envisioned, the technology of making the final product, the technology of making and handling the org, the procurement of a location, recruitment, an org bd, hats, and training and the equipment and materiel needed to produce the final product and the obtaining of the raw material to make the final product. Thus established, it must be done so that:

i. The amount of org is created proportionate to its final product demand.

ii. The quality of the org itself — shabby, posh, active or lazy, etc.

iii. The viability of the org (how long will it last economically, how will it expand, does income exceed outgo, etc.).

The product of the org itself is regulated by:

iv. The quantity of product produced (which must be of sufficient volume to satisfy demand).

v. The quality of the org's product or products (which must be adequate to satisfy those requiring and paying for the production).

vi. The viability of the org's product (how long does it last and is it adequate for its value).

The repair of the org itself must be:

vii. The quantity or amount of repair necessary to make the org functional (which may amount to simply giving it a new letterhead or rebuilding the whole place, nearly the establishing product again).

viii. The quality or expertness of the repair (a bad one could destroy the place).

ix. The viability of the repair (if the right Why is handled the repair as a product will last a long time and if a wrong reason for decline is handled the place will just cave in again).

The correction of the org's product to obtain a uniformly satisfactory product:

x. The quantity (proportion) of the org's product that has to be corrected (which might require, if too high, the repair of some part of the org itself).

xi. The quality of the correction (expert and can be afforded and itself nondestructive).

xii. The viability of the product corrected. (Will it last and be nearly as good as the better produced product?)

All these factors must be consulted.

ANALYSIS

If one understands these factors and realizes they are all present in running an eggbeater or the world's biggest oil company, one will not be groping around in rags.

A checklist of the twelve factors influencing the four major products can be made up and each point as it relates to an org can be studied about a particular org.

One has here the basics. From these there can arise a near infinity of lesser items.

When one does not know these basics one flounders endlessly while attempting to handle a post, a portion of an org or the whole org. One gets into a frantic correct the errors and outpoints or goes into apathy as he has no guidelines.

However, using these basics, one can easily check them off and so see what he has to do to more closely approach the ideal.

In Dianetics and Scientology, for example, the final pc product of Flag auditors trained on the same HCOBs as field auditors, on *rougher* pcs, is infinitely better than the pc product elsewhere. This is a puzzle. The clue is not in auditing at all. It lies in an earlier product — training. A Class VI or a Class VIII Auditor on Flag was trained (a) more rapidly (amounting to as little as 1/6th of the time in an org) and (b) more honestly and (c) the Flag auditor is expertly corrected as a product when he begins to audit until the auditing product is perfect. The training (quantity, quality and lasting quality) on the course is better and the training extends to training on post until the auditor's product (the auditing of the pc and the pc) need little or no product correction. The equivalent used to be required HGC training — on-post training — for a staff auditor to become a *staff* auditor. In no org did auditors go fresh from school into auditing with no further training. This went out in some orgs. The product "corrected auditor" became a missing product. Thus Flag auditing produces a better product as *that* product — corrected auditor — exists on Flag.

This is given to show the *use* of the product factors.

Where any of these products or factors are missing, the viability of the whole is shaken. By using them the whole becomes viable.

ORG SERIES 11

ORGANIZATION AND MORALE

Morale is a large factor in organizing.

An executive is utterly dependent upon the willingness of those who work for him. *(How to Live Though an Executive)*

Willingness, while it is also a factor in morale, is also a manifestation of morale.

Morale, the tone of a group, is the target of "do-gooders," the "one-worlders," the labor agitator, the commie agent, the local minister and a general mixed company of often well-meaning but nevertheless deadly people.

"You poor fellow. They treat you so badly . . . we will take up this great injustice . . . workers should have everything free . . . communist imperialist aggressors against poor working people . . . You poor fellow, God will make you welcome in his heaven from this earthly toil . . . Kill the managers . . . Down with law and order . . ."

Well, it all winds up in revolution eventually and mounds of dead workers and a few dead managers.

So let's look this over.

If you can do something about an ill situation you do. If you can be effective, you can at least make the situation easier. If you can't do that you can sympathize.

Sympathy with the abused apparently not only does no good but winds up in revolt!

How?

You have this young girl, see. She is wearing last year's dress. No new clothes. So you say, "You poor thing wearing last year's dress." Up to now she wasn't worried about it. Now she says, "I wish I had some new clothes." And you say, "You poor thing. Doesn't your mother ever buy you new clothes?" "No." "The beast!" She goes home and revolts.

Get it?

The UN says, "Every woiker, he got to have job, house, lotsa dough." Worker says, "Who? Me?" "Yes you poor downtrodden sod." And the UN says, "United States. You

rich. You pay!" US pitches out the foreign aid. The countries take the dough and revolt and elect a military junta that chops off heads every hour on the hour.

The one-world do-gooders in the US say, "US, you pay poor fired woikers!" US puts out sixty-three billions. You can't walk down a street. Riot and insurrection.

Why?

Sympathy. But not one brain cell worth of organization.

People want to be part of things, part of life.

If the clodheads that pass for modern politicians had the ability to organize and handle an economy (in big countries or small) people could easily be part of things and build the place up. It is in fact a highly skilled activity. And currently quite beyond the heads of nations. Or they wouldn't have unemployment, riots, inflation and future death.

Take Russia. (You take her, I don't want her.) She had half a century of growing revolt. The oatmeal-brained Romanoffs spent their rubles on war and secret police. Up jumped Lenin, "You poor woikers!" Revolt. Dead czar. Dead Russia. Their "workers' paradise" can't feed itself. The czars were supremely awful. Their commissars weren't even that good. One secret policeman per worker was about the ratio in Stalin's day.

Let's be practical. Who is going to build this UN house for the poor worker? Who is going to pay the billions except the worker?

And if, as we so glaringly see, the end product of all this "poor worker" is riot and civil commotion, insurrection and piles of dead workers then mightn't there be something a bit awry with its morale value?

Sympathy is a morale depressant. And knowingly or not, a morale destroyer.

If the person who sympathized was good enough to do something about it he would.

There's nothing at all wrong with righting evil conditions. Far from it.

But if you want to better things KNOW HOW TO ORGANIZE.

Don't just stir up a revolt that will get workers machine-gunned.

If the chronic moaner knew how to throw together an organizing board and groove in the lines, as part of the state or the opposition, he could certainly change things for the better.

Organizing is the know-how of changing things.

Good morale is the product of good organization!

If you organize something well and efficiently you will have good morale. You will also have improved conditions.

Wherever morale is bad, organize!

A very careful survey of people shows that their basic protests are against lack of organization. “It doesn’t run right!” is the reason they protest things.

Inequalities of workload, rewards unearned, no havingness, these are some of the things that are snarled about.

They are cured by organizing things.

Russia Siberiaed or shot all her managers, thinking managers and capitalists were the same thing. Then she couldn’t feed her people.

And you can’t even discuss morale as a subject when a country has to be held together with barbed wire frontiers to hold in its own secret policed people!

The only thing I really have against communists is that they know how to make a revolt but not how to make a country.

And the only thing I have against the capitalist do-gooder is that all the corn and games in the world will not make a viable country.

Neither system winds up in happiness or high morale.

The physical universe is no rose bed. But it can be confronted and can be lived in by a group.

Wherever you see bad morale, behind it you will see chaotic disorganization.

A nation or an org follow the same laws.

Disorganization from any cause deprives people of wanted beingness, doingness and havingness.

When you deprive people of those things you’re going to have pretty awful morale.

And only organization and very good organization will bring about beingness, doingness and havingness.

All three factors must be served. And purpose and reason must exist.

A bum with a handout sandwich is a bum with a handout sandwich. You can’t change anyone upward with sympathy. It is a witch’s weapon, a devil’s curse. But you *can* change someone upward with organization.

Bad organization = bad morale.

Good organization equals good morale.

And good organization is something worked on by a group, not ordered under pain of death.

The only tops that get blown when effective organization starts going in are those who don't want others to have things and take delight in suppression — in other words, good organization is only opposed by those who have reason to fear others. For in organization lies the secret of a group's strength.

A small group thoroughly organized can conquer the disorganized billions. And have excellent morale while they're doing it!

ORG SERIES 12

THE THEORY OF SCIENTOLOGY ORGANIZATIONS

This "HCO Bulletin" 21 Sept. 58 explains how a Scientology organization differs from "the industrial ideal."

The industrial idea of organization is a cogwheel-type organization with each member of it totally fixed on post, doing only exact duties, with all cogwheels intending to mesh. The industrial idea does not differentiate between a *machine* and a human or live organization.

The product laws (Products 1, 2, 3 and 4 as given in this Org Series) apply to both a live organization and a machine organization and any organization. Since a live and a machine organization hold these laws in common, the industrialist confuses the live organization and the machine organization.

HCO PL 29 Oct. 70 I, Org Series 10, THE ANALYSIS OF ORGANIZATION BY PRODUCT, also carries a mention of this difference between a live and a machine organization.

As the industrial idea has already been mentioned in this Org Series, and as this Org Series mainly applies to live (not machine) organizations, and as people tend to fall into a machine organization pattern (and also to use a live organization to *not* know their own specialty best) this earlier issue on live organization is published in full:

HUBBARD COMMUNICATIONS OFFICE

HCO BULLETIN OF 21 SEPTEMBER 1958

FOR ALL STAFF
MEMBER HATS

THEORY OF SCIENTOLOGY ORGANIZATIONS

An organization is a number of terminals and communication lines united with a common purpose.

The actions of an organization can all be classified under the heading of particle motion and change. To analyze a post or a department or an organization, make a list

of each particle it handles (whether types of bodies, types of comm or any other item) and follow each item from the point it enters the post or department or organization to the point it exits. If a particle isn't handled *properly* and passed along *properly* there is a confusion or a dead end. To organize an organization requires more than theory. One has to inspect and list the particles and get their routes and desired changes of character en route. Then he has to see that terminals and comm lines exist to receive, change and forward the particle. All types of particles belong to somebody, are handled some way, come from somewhere and go somewhere. There are no confusions when lines, terminals and actions exist for each type of particle.

Judgment and decision are needed in every staff post. If the handling of items are just "petty details" then so is your fellow man a "petty detail."

There are no laborers in a Scientology organization. We are all managers of these particles.

Routes of handling are not orders to handle but directions to go. A route is not necessarily correct for all cases. It is only correct for most cases. Robots can't handle livingness. Robot organizations and robot civilizations fail. They only *seem* to work — like the commie empire *seems* to work until you find out everyone is starving to death in it. A *perfect* organization is not a machine but a pattern of agreements. A route is only the *agreed upon* procedure. It is not only occasionally broken, it now and then should be. The terminals involved make the agreement or the route doesn't work. A route along terminals that never agreed is no route but a labyrinth. People agree to postulates they can understand and appreciate. Hence, a route and handling begins with a particle, develops with a theory, comes to life with an agreement and continues to work because of judgment and decision.

The routing, the comm lines, the pattern of an organization do not do the work. The work is done by living beings using good sense and skill. The organizational pattern only makes their work easier and lessens confusion and overburden. Governments, armies, big research bureaus reduce themselves down to routes and titles. They don't work. They don't do work. They allow for no human equation. Therefore, slave societies (composed only of routes and unthinking terminals) are always beaten eventually by free peoples. There is a point where routes and exact procedures become unworkable, just as there is a point, facing a volume of work, that individuality and no teamwork becomes unworkable. An optimum organization is never severely either one. Total individualism and total mechanization alike are impossible. So if you or your department or your organization seem to be too heavily inclined to either one, *yell* don't talk. A bad organization will fire you and you can do something more profitable. A good organization will listen. BUT — always have a *better* idea than the one in use. Grumbling, refusing to work don't work. A better idea, talked over with the terminals on either side of you, put down in concise writing, submitted, will be put into action in a good organization. Of course, there's always a chance that the new proposed handling throws something out of gear elsewhere. If it does, you have the right to know about it.

An "organization" doesn't get the work done. As an orderly plan it helps its terminals get the work done. The staff as individuals do the work. An organization can help or hinder getting the work done. If it helps, it's good. If it hinders, it should be examined thoroughly.

An organization can work wholly at "taking in its own laundry." All the work that gets done is the work generated inside the shop by unreal routes and weird changes of particles. This is a government circa mid-twentieth century. Its highest skill is murder which in its profundity it makes legal.

A totally democratic organization has a bad name in Dianetics and Scientology despite all this talk of agreement. It has been found by actual experiment (LA 1950) that groups of people called on to select a leader from among them by nomination and vote routinely select only those who would kill them. They select the talkers of big deeds and ignore the doers. They seem to select unerringly the men of average skill. That is never good enough in a leader and the people suffer from his lack of understanding. If you ever have occasion to elect a leader for your group, don't be "democratic" about it. Compare records as follows: Take the person who *is* a good auditor, not just says he is. Take the person who has a good, not necessarily the highest, profile and IQ. Take the person who can grant beingness to others. And look at the relative serenity and efficiency of any past command he may have had. And even then you're taking a chance. So always elect temporarily and reserve the right of recall. If his first action is to fire people, recall him at once and find another leader. If the organization promptly prospers, keep him and confirm the election by a second one. If the abundance of the organization sags in a month or so, recall and find another. Popularity is some criteria — but it can be created for an election only, as in the US. Select in an election or by selection as an executive the person who can get the work done. And once he's confirmed, obey him or keep him. He's rare. But beware these parliamentary procedure boys and girls who know all the legal and time wasting processes but who somehow never accomplish anything except chaos. A skilled, successful leader is worth a million impressive hayseeds. Democracies *hate* brains and skill. Don't get in that rut. In the US War between the States militia companies elected their officers with great lack of success in battle. They finally learned after tens of thousands of casualties that it was skill not popularity that counted. Why be a casualty — learn first. Democracy is only possible in a nation of Clears — and even they can make mistakes. When the majority rules, the minority suffers. The best are always a minority.

WHAT IS YOUR JOB?

Anything in an organization is your job if it lessens the confusion if you do it.

Your being exactly on post and using your exact comm lines lessens confusion. *But* failure to wear another hat that isn't yours now and then may cause more confusion than being exactly on post.

The question when you see you will have to handle something not yours is this: "Will it cause less confusion to handle it or to slam it back onto its proper lines?"

Example: A preclear wandering around looking for somebody to sell him a book. You see him. The book sales clerk isn't there. The books are. Now what's the answer? You'll create a little confusion if you hand him a book, take his money and give it to the book sales later. You'll create confusion for your own post and the organization if you go chasing around trying to find "book sales terminal." You'll create a feeling of unfriendliness if you don't help the preclear get his book. Answer it by deciding which is less confusing. You'll find out by experience that you can create confusion by

handling another's particles *but* you will also discover that you can create confusion by not handling another's particles on occasion.

The only real error you can make in handling another's particles is to fail to tell him by verbal or written comm *exactly* what you did. You stole his hat for a moment. Well, always give it back.

Remember, in a Scientology organization every *Scientologist* on staff potentially wears not just his own but *every* hat in the organization. He has to know more jobs than his own. Particularly jobs adjacent to his post. He often has to do more jobs than his own because those jobs have to be done and he sees it. A non-Scientology member of an organization is only limited in what he can do in the organization by lack of know-how. But the limitation is applicable only to instruction and auditing. But a Scientologist: he may find himself wearing any hat in the place including mine. And others may now and then wear his hat.

A staff member gets the job done of (1) his own post, (2) his department and (3) the whole organization.

People who are *always* off-line and off-post aren't doing their own jobs. When we find somebody always off-post and in our hair, we know if we look at *his* post we'll find a rat's nest. So there are extremes here as well.

HOW TO HOLD YOUR JOB

Your hat is your hat. It is to be worn. Know it, understand it, do it. Make it real. If it isn't real, it is *your fault* since you are the one to take it up and get it clean with an executive. If he doesn't straighten it up so you can do it, it's still your fault if it's not done.

You hold a job in a Scientology organization by doing your job. There are no further politics involved — at least if I find out about it there aren't. So do your job and you've got a job. And that's the way it is.

But on post or off, we only fail when we do not help. The "public" only objects to us when we fail to help or when we fail to answer their questions. So we have two stable data on which we operate whether we're on post or not:

HELP PEOPLE!

ANSWER PEOPLE'S QUESTIONS EXACTLY!

When you don't you let everybody down.

NEATNESS OF QUARTERS

— THE PUBLIC KNOWS US BY OUR MEST —

A part of everyone's hats is keeping a good mock-up in people, offices, classrooms, quarters.

Keep your desk and your MEST neat and orderly. It helps.

And when you see things getting broken down or run down or dirty, fix them or clean them or if you can't, yell like hell on the right comm line.

THE DESPATCH SYSTEM

The despatch system is not there to plague you but to help you.

Except when you've got to have speed, *never* use an interoffice phone to another terminal. And never write a despatch and present it and *you* at some other point at the same time. That's "off-line" just as a phone is "off-line." A good use of the organization's lines reduces confusion. The other guy is busy, too. Why interrupt him or her unnecessarily with routine that should go on the lines? You'll usually get an answer in the same day or at least in 24 hours. The organization's comm lines are pretty good. They make it possible for this small handful of us to get more things done in this society than any other organization on Earth in terms of actual accomplishment.

A comm line can be jammed in several ways. Principal of these is *entheta*. Ask yourself before it goes on the lines — it's bad news but is it necessarily important? Another is *overburden*. Too much traffic jams a line. Too long a despatch doesn't get read. Another is *too little* data. That can jam a line but thoroughly. It takes more despatches to find out what goes. Another way is to bypass the line itself — this jams the terminal. The final way, in broad classes, to jam a comm line is to *put erroneous data* on it.

The last is a pet hate of Scientology people. Generally its form is "everybody knows." Example: "They say that George is doing a bad job," or "Nobody liked the last newsletter." The proper rejoinder is "Who is Everybody?" You'll find it was one person who had a name. When you have critical data omit the "everybody" generality. Say who. Say where. Otherwise, you'll form a bad datum for somebody. When our actions are said to be unpopular, the person or persons saying so have names.

IN SUMMARY

A post in a Scientology organization isn't a job. It's a trust and a crusade. We're free men and women — probably the last free men and women on Earth. Remember, we'll have to come back to Earth someday no matter what "happens" to us. If we don't do a good job *now*, we may never get another chance.

Yes, I'm sure that's the way it is.

So we have an organization, we have a field we must support, we have a *chance*.

That's more than we had last time night's curtain began to fall on freedom.

So we're using that chance.

An organization such as ours is our best chance to get the most done. So we're doing it!

HCO POLICY LETTER OF 13 NOVEMBER 1970

REMIMEO

ORG SERIES 13

PLANNING BY PRODUCT

One of the cycles or correct sequences of action is:

BE — DO — HAVE

This sequence is often altered in orgs and even in individuals. Be is first in the physical universe, Do is second, Have is third.

By getting it out of sequence a considerable confusion can be generated.

A lot of riddles of human behavior can be solved by realizing this goes out of sequence or gets omissions.

The Spanish peasant and the Spanish officials go to war at the drop of a straw. Their history is jammed with revolts. The peasant knows that if he is a peasant (be) and does his work (do) he should have. The Spanish official is stuck in BE. He *has* so he can *be* and he doesn't have to *do* anything. Also a degree or title in Spain is a BE and there is no *do*. So there is no *have* unless it comes from the peasant. The two altered cycles collide.

Juvenile delinquency and shattered lives in the West stem directly from corruptions of this cycle.

Children in the West are commonly asked, "What are you going to BE when you grow up?" It is a silly question and can drive any child up the wall. Because it's the wrong question — hits the wrong end of the cycle. He can't work out his personal org bd easily.

He is also asked, "What are you going to DO in life?" That's just as bad. It is quite difficult to answer.

You have to do an org bd backwards — establish the product (have), find out what to *do* to achieve it and only then really can you accurately discover what one has to BE to accomplish this.

A lot of people and businesses fail because they don't do this. A beingness taken first all too often winds up in a doingness without any havingness resulting.

If we asked children, "What do you want to PRODUCE in life?" we could probably get a workable answer. From *that* he could figure out what he'd have to do to produce

that and from that he could know what he had to BE. Then, with a little cooperation, he would be able to lead a happy and valuable life.

Concentrating on BE? one finds him ready to BE all right, but then he stands around the next fifty years waiting for his havingness to fall out of the sky or slide to him via a welfare state.

The above data, missing in society, contributes to juvenile delinquency, crime, the welfare state and a dying civilization.

It is a wrong personal org bd to BE only.

So it is with an activity or company.

What is the desired product that will also be desired by others? is the first question one asks in organizing. It must be answered before one can adjust or arrange finance or any org bd.

Then one asks what has to be *done* to produce that? And there may be a lot of dones figured out and put in sequence.

Now one can work on BE.

Thus you would have the basic ingredients of an org bd.

Here is a common altered cycle:

Mr. A has a truck — HAVE. He tries to figure out what to DO with it. He works it around to try to make money. He would usually go broke. As he supposes he already has a product — a truck, and he needs a product — "money," he rarely backs it up to a BE.

Some people's "think" gets all involved in altered sequences or omissions of the BE — DO — HAVE cycle.

An activity has several final products. All of them must be worked out and considered. Then one can work out the sequence of DOs (each with a product) in order to accomplish the final products. Only then can one work out the BE.

By omission or fixations on one of these points a person or an org can fail or perhaps never even get started.

Fixation on DO without any product in view leads to bored wandering through life.

Mothers even know this one. "Mama, what shall I do?" is a long-drawn refrain. Smart mamas often say "Make a cake" or "Make mud pies" or "Make a house." Dumb ones say "Go and play and stop bothering me!"

Armies, with guard or death "products," get obsessed with DO to a point where officers and noncoms will state "Get those men busy!" No product. Meaningless, often frantic and useless DO.

It could be said that any developed traffic (dev-t) comes from people who have no product.

Immense bureaucracies can build up where there are no realized or stated products.

Target policies and practice are successful because they state the desired product.

Unless one organizes from the final product the organization can get unreal and useless.

Even Russia could learn this one. Their "workers" are all trying to get to the university where they can BE. The Russian government was recently pleading with young people to become workers. But of course that's just another BE that implies DO. Russia has yet to realize her product was and is revolution. It's no wonder their main problem is how to feed and clothe and house their people.

Unless an org or a person knows exactly what the final product is for the org or a post, there'll be a lot of busyness but not very much havingness for anyone.

The answer is to figure out the final product and work back through the do of subprojects and you will then materialize a real org, a real beingness.

HUBBARD COMMUNICATIONS OFFICE
SAINT HILL MANOR, EAST GRINSTEAD, SUSSEX

HCO POLICY LETTER OF 14 NOVEMBER 1970

REMIMEO

ORG SERIES 14

THE PRODUCT AS AN OVERT ACT

When a product is nonexistent or bad it can be classified as an overt act against both the org and any customer.

You can estimate what the existing scene of a post really is by looking at its product.

When a flubby product is observed, you can at once approximate the existing scene.

The time it takes to achieve the product is also an estimation. A long time to achieve a small flubby product gives one a good idea of the existing scene.

This also estimates the amount of "noise" in an area.

Example: Post X is supposed to sort ruddy rods. There are no sorted ruddy rods ready. That's an omitted action. The post has to be ordered to sort ruddy rods. That's ordering someone to wear his hat which is altered sequence as he should have been wearing it already. The post must be a false terminal as it isn't wearing its hat. The product so far is no sorted ruddy rods. You order them sorted. You get bent tangled ruddy rods furnished after a long time period filled with dev-t. Estimate of existing scene — psychotic and an awful long way from any ideal scene. Actual quality of product — an overt act.

When several org members are furnishing a poor individual product, the org becomes difficult to handle as the person in charge is operating as correction not as establishment and org product.

Wherever an org's product is low in quantity and quality one must recognize that it contains several members who unconsciously furnish overt acts in the guise of post products and begin to straighten things out accordingly.

The road to sanity for such a person or org is a good grasp of organizing and products, making known the technology needed to produce a product, getting it properly done so that the person can then wear his hat.

If this still doesn't occur, personal processing is necessary as the personnel may well be dramatizing overt acts (harmful acts) by turning out a bad product.

ORG BOARDS
INDEX

The final product of an org is the combined products of all the members of that org directed to accomplish the final products of that org.

Stupidity, lack of a worked out org bd, lack of recognition of what the final org products should be, lack of training, lack of hats can produce poor final products. In an activity not doing well, the poor final product or its lack of any product is the compound errors in subproducts. An org where the product is pretty bad or nonexistent contains many elements — posts — in it which have as *their* individual "post products" not products at all but overt (harmful) acts.

Pride of workmanship is pride in one's own product.

Every post has some product. If the products of all posts in an activity are good and the product sequence is good then the final products of the org will be good.

WORD CLEARING SERIES 18

ORGANIZATION MISUNDERSTOODS

By Scientology study technology, understanding ceases on going past a misunderstood word or concept.

If a person reading a text comes to the words "Felis domesticus" and doesn't know it simply means HOUSE CAT, the words which appear thereafter may become "meaningless," "uninteresting" and he may even become slightly unconscious, his awareness shutting down.

Example: "Wind the clock and put out the Felis domesticus and then call Algernon and tell him to wake you at 10:00 A.M.," read as an order by a person who didn't bother to find out that "Felis domesticus" means "house cat" or "the variety of cat which has been domesticated" will not register that he is supposed to call Algernon, will feel dopey or annoyed and probably won't remember he's supposed to wake up at 10:00 A.M.

In other words, when the person hit a misunderstood word, he ceased to understand and did not fully grasp or become aware of what followed after.

All this applies to a sentence, a book, a post or a whole organization.

Along the time track a crashing misunderstood will block off further ability to study or apply data. It will also block further understanding of an organization, its org board, an individual post or duties, and such misunderstoods can effectively prevent knowledge of or action on a post.

ALL THIS IS THE MOST COMMON CAUSE OF AN UNACCEPTABLE POST PRODUCT, OR NO PRODUCT AT ALL.

The difficulties of an organization in functioning or producing stem from this fact.

Personal aberration is the cause of products that are in fact overt acts.

Scientology technology today easily handles the personal aberration part of the problem, IF IT IS USED AND PROPERLY APPLIED. Leaving an org unaudited or being unable to figure out how to run a viable org so that it can afford to audit its staff members is asking for post or org products that are overt acts.

Employing persons of the Leipzig, Germany, death camp school (psychologists, psychiatrists) to handle personal aberration is like throwing ink in water to clean it

up. Governments stupidly do this and wonder why their final product as an organization is riot, war and a polluted planet. The point is not how bad psychology and psychiatry are, but that one does have to *handle* personal aberration in an organization, and these schools were too vicious and incompetent to do so.

Those who are personally very aberrated are not about to produce anything but an overt act. They are difficult to detect as they are being careful not to be detected. Things "just sort of go wrong" around them, resulting in a product that is in fact an overt act. But these constitute only about ten or twenty percent of the population.

The remaining eighty percent or ninety percent where they are nonfunctional or bungling are so because they do not understand what it's all about. They have in effect gone on by a misunderstood such as what the org is supposed to do or the admin tech they use on their posts or where they are or what their product is.

Earth organizations like governments or big monopolies get a very bad repute because of these factors:

1. Personal aberration of a few undetected and unhandled,
2. Inadequate or unreal basic education technology and facilities.
3. Inadequate or unknown organization technology.
4. Noncomprehension of the individual regarding the activities of which he is a part.
5. Noncomprehension of the basic words with which he is working.
6. Purposes of the post uncleared.
7. Admin of the post not known or comprehended.
8. Technology in use not fully understood.
9. A lack of comprehension of products.

Out of these nine things one gets organizational troubles and the belief that it takes a genius to run one successfully. Yet all the genius in the world will fail eventually if the above nine things are not handled to some degree.

The common methods currently in use on the planet to handle these things are very crude and time-consuming as the items themselves are either dimly comprehended or not known at all.

1A. Personal aberration is met by torture, drugs or death when it is detected. Yet only the very serious cases who are obviously screaming, muttering or unconscious are singled out, whereas the dangerous ones are neither detected nor handled at all and become with ease generals or presidents or dictators, to say nothing of lesser fry. Ten percent to 20 percent of any organization is stark staring mad, doing the place in so adroitly that only their actual product betrays them.

2A. Basic education as well as higher general education has become a mass-produced area crawling with bad texts and noncomprehension and used

mainly by hostile elements to overturn the state or pervert the race and its ideals.

3A. Organizational technology is so primitive as to change national maps and leading companies many times a century, an extremely unstable scene for a planet.

4A. Very few individuals on the planet have any concept of the structure of entities such as their country or state or company. Persons surveying the public in the US, pretending to advise acceptance of "new measures" already in the Constitution, were threatened for being revolutionaries. Hardly anyone knew the basic document of the nation's organization much less its rambling structure.

5A. The basic words of organization are glibly used but not generally comprehended, words like "company," "management," "policy." Vocabularies have to be increased before comprehension and communication occur and misunderstoods drop out.

6A. Post purposes are often glibly agreed with while something entirely different is done.

7A. Administrative actions involving posts are often only dimly comprehended and seldom well followed; but in this matter of communication, despatches, etc., the planet is not as deficient as in others except that these functions, being somewhat known, can become an end-all — tons of despatches, no actual product. In some areas it is an obsession, an endless paper chain, that is looked on as a legitimate product even when it leads to no production.

8A. The planet's technology is on the surface very complex and sophisticated but is so bad in actual fact that experts do not give the planet and its populations thirty years before the smoke and fumes will have eaten up the air cover and left an oxygenless world. (The converters like trees and grass which change carbon dioxide to oxygen are inadequate to replace the oxygen and are additionally being killed by air impurities coming out of factories and cities.) If the technology destroys the base where it is done — in this case the planet — it is not adequate and may even be destructive technology.

9A. The whole idea of "product" is not in use except in commercial industry where one has to have a car that sells or a washing machine that actually washes.

THE HARD ROAD

It is against this primitive background that one is trying to run an organization.

If it were not for improvements made on each one of these points, the task could be hopeless.

I have gone to some length to outline the lacks in order to show the points where one must concentrate in (a) putting an org together and (b) keeping it viable.

In these nine areas we are dealing with the heart of it in running orgs.

Enthusiasm is a vital ingredient. It soon goes dull when insufficient attention is paid to resolving and getting in these nine points.

Bluntly, if they are not gotten in and handled, the task of living and running a post or an org will become so confused that little or no production will occur and disasters will be frequent.

THE WORDS

The by no means complete list of words that have to be fully cleared and understood just to talk about organization as a subject, and to intelligently and happily work in an org EVEN AS ITS LOWEST EMPLOYEE is:

A company
A board of directors
Top management
Policy
Management
Programs
Targets
Orders
Technology
Know-how
Org bd
Post
Hat
Cope
Purposes
Organize
Duties
A checksheet
A checklist
A comm channel
A command channel
A relay point
A stable terminal
Double-hatted
A product
Aberration
VIABILITY

This is key vocabulary. One could draw up a whole dictionary for these things and no one studying it would be any wiser since it would become salted with other words of far less importance.

The way to do this list is sweat it out with a meter until one knows each can't mean anything else than what it does mean.

Out of a full understanding of what is implied by each, a brilliantly clean view is attained of the whole subject of organization, not as a fumble but as a crisp usable activity.

Unless one at least knows these words completely so that they can be used and applied, they will not buffer off confusions that enter into the activity.

Glibness won't do. For behind these words is the full structure of an activity that will survive and when the words aren't understood the rest can become foggy.

We *do* know all these needful things. We must communicate them and use them successfully.

ORG SERIES 16

POLICY AND ORDERS

Probably the greatest single confusion that can exist in the subject of organizing is the reversal of "policy" and "orders."

When definitions of these two things are not clearly understood they can be identified as the same thing or even reversed.

When they are not understood plainly then staff members set their own policy and demand orders from top management, totally reversing the roles.

Confusion thus generated can be so great as to make an organization unmanageable. It becomes impossible for staff to do its job and management cannot wear its hat.

People in an organization obsessively demand orders from policy source and then act on their own policy. This exactly reverses matters and can be a continual cause of disorganization.

As policy is the basis of group agreement, unknown policy or policy set by the wrong source leads to disagreement and discord.

Demanding or looking for orders from policy source and accepting policy from unauthorized sources of course turns the whole organization upside down. The bottom of the org board becomes the top of the org board. And the top is forced to act at lower levels (order issue) which pulls it down the org board.

But this is not strange as we are dealing here with principles rather new in the field of organization, principles which have not been crisply stated. THERE IS NO EXACT ENGLISH WORD for either of these two functions.

POLICY as a word has many definitions in current dictionaries amongst which only one is partially correct: "A definite course or method of action to guide and determine future decisions." It is also "prudence or wisdom," "a course of action" and a lot of other things according to the dictionary. It even is said to be laid down at the top.

Therefore the word has so many other meanings that the language itself has become confused.

Yet, regardless of dictionary fog, the word means an exact thing in the specialized field of management and organization.

POLICY MEANS THE PRINCIPLE EVOLVED AND ISSUED BY TOP MANAGEMENT FOR A SPECIFIC ACTIVITY TO GUIDE PLANNING AND PROGRAMING AND AUTHORIZE THE ISSUANCE OF PROJECTS BY EXECUTIVES WHICH IN TURN PERMIT THE ISSUANCE AND ENFORCEMENT OF ORDERS THAT DIRECT THE ACTIVITY OF PERSONNEL IN ACHIEVING PRODUCTION AND VIABILITY.

POLICY is therefore a principle by which the conduct of affairs can be guided.

A policy exists, or should exist, for each broad field or activity in which an organization is involved.

Example: The company has a lunchroom for its employees. Top policy concerning it might be "To provide the employees cheaply with good food and clean fast service." From this the lunchroom manager could plan up and program how he was going to do this. With these approved they form the basis of the orders he issues.

Now let us say the manager of the lunchroom did not know organization and that he did not try to get a policy set or find if there was one and made up his own policy and planned and programed and issued his orders on that. Only the policy *he* makes up is "To make dough for the company."

Now the wild melee begins.

Top management (the lunchroom manager's highest boss) sees stenos eating cold lunches brought from home at their desks. And begins to investigate. How come? Stenos then say, "We find it cheaper to eat our own lunches." Top management finds coffee in the lunchroom is terrible and costs several shillings. Dried-out sandwiches cost a fortune. There is no place to sit . . ., etc. So top management issues *orders* (not policy). "Feed that staff!" But nothing happens because the lunchroom manager can't and still "make dough for the company." Top management issues more *orders*. The lunchroom manager thinks they must be crazy at board level. How can you make dough and still feed the whole staff? And top management thinks the lunchroom manager is crazy or a crook.

Now you multiply this several times over in an organization and you get bad feeling, tension and chaos.

Let us say top management had issued policy: "Establish and run a lunchroom to provide the employees cheaply with good food and clean fast service." But the lunchroom manager hired knew nothing of organization, heard it, didn't realize what policy was and classified it as a "good idea." Idealistic, probably issued for PR with employees. "But as an experienced lunchroom man I know what they really want. So we'll make a lot of dough for the company!"

He thereafter bases *all* his orders on this principle. He buys lousy food cheap, reduces quality, increases prices, cuts down cost by no hiring and does make money. But the company gets its income from happy customers who are handled by happy staff members. So the lunchroom manager effectively reduces the real company income by failing to cater to staff morale as was intended.

UNPREDICTABLE

It is a complete fact that no top management can predict WHAT policy will be set by its juniors.

The curse of this is that top management depends on "common sense" and grants greater knowledge of affairs to others at times than is justified. "Of course anybody would know that the paper knives we make are supposed to cut paper." But the plant manager operates on the policy that the plant is supposed to provide employment for the village. You can imagine the squabble when the paper knives which do NOT cut paper fail to sell and a threatened layoff occurs.

Nearly all labor–management hurricanes blow up over this fact of ignorance of policy. It is not actually a knowing conflict over different policies. It's a conflict occurring on the unknown basic of unknown or unset policy of top management and the setting of policy at an unauthorized level.

ORDERS

"Order" takes up two small print columns of the two-ton dictionaries.

The simple definition is:

AN ORDER IS THE DIRECTION OR COMMAND ISSUED BY AN AUTHORIZED PERSON TO A PERSON OR GROUP WITHIN THE SPHERE OF THE AUTHORIZED PERSON'S AUTHORITY.

By implication an ORDER goes from a senior to juniors.

Those persons who do not conceive of an organization larger than a few people tend to lump all seniors into order-issuers, tend to lump anything such a senior says into the category of order and tend to lump all juniors into order-receivers.

This is a simple way of life, one must say.

Actually it makes all seniors bosses or sergeants and all juniors into workers or privates. It is a very simple arrangement. It does not in any way stretch the imagination or sprain any mental muscles.

Unfortunately such an organized arrangement holds good for the metal section of the shop or a platoon or squad. It fails to take into account more sophisticated or more complex organizations. And it unfortunately requires a more complex organization to get anything done.

Where one has squad mentality in a plant or firm, one easily gets all manner of conflict.

Few shop foremen or sergeants or chief clerks ever waste any time in trying to tell the "rank and file" what the policy is. "Ours was not to reason why" was the death song of the Light Brigade. And also the open door to communism.

Communism is unlikely to produce a good society because it is based on squad mentality. Capitalism has declined not because it was fought but because it could not

cope with squad mentality. The policies of both are insufficiently embracive of the needs of the planet to achieve total acceptability.

An order can be issued solely and only because its issuer has in some fashion attained the right to issue the instruction and to expect compliance.

The officer, the chief clerk, the shop steward, the sergeant, each one has a license, a warrant, a "fiat" from a higher authority which entitles him to issue an *order* to those who are answerable to him.

So where does this authority to issue orders come from?

The head of state, the government, the board of directors, the town council, such bodies as one could consider top management in a state or firm, issues the authority to issue orders.

Yet such top persons usually do not issue authority to issue orders without designating what the sphere of orders will be and what they will be about.

This is the policymaking, appointment making level at work.

All this is so poorly and grossly defined in the language itself that very odd meanings are conceived of "policy" and "orders."

Unless precise meanings are given, then organization becomes a very confused activity.

Understood in this way, the following sentence becomes very silly: "The board of directors issued orders to load the van and the driver was glad to see his policy of interstate commerce followed."

Yet a group will do this to its board of directors constantly. "You did not issue orders . . ." "We were waiting for orders . . ." "I know we should have opened the doors but we had no order from the council . . ."

The same group members, waiting for orders to sit or stand by special board resolution, will yet set policy continually. "We are trying to let others do their jobs without interference." "I am now operating to make each member of my department happy." "I am running this division to prevent quarrels."

Ask officers, secretaries, in-charges, "What policy are you operating on?" and you will get a quick answer that usually is in total conflict or divergence from any board policy. And you will get a complaint often that nobody issues their division orders so they don't know what to do!

The fact is that POLICY gives the right to issue orders upon it to get it in, followed and the job done.

A group of officers each one issuing policy madly while waiting for the head of the firm to give them orders is a scene of mix-up and catastrophe in the making.

Policy is a long, long-range guiding principle.

An order is a short-term direction given to implement a policy or the plans or programs which develop from policy.

"People should be seated in comfortable chairs in the waiting room" is a policy.

"Sit down" is an order.

If policy is understood to authorize people to issue orders, the picture becomes much clearer.

"Clearing post purpose" is another way of saying "Get the policy that establishes this post and its duties known and understood."

Unless an organization gets this quite straight, it will work in tension and in internal conflict.

When an organization gets these two things completely clear, it will be a pleasant and effective group.

HCO POLICY LETTER OF 1 DECEMBER 1970

REMIMEO

ORG SERIES 17

REALITY OF PRODUCTS

The character of the VALUABLE FINAL PRODUCTS OF AN ACTIVITY is something which must be established EXACTLY.

Example: Ajax Ball Bearings Ltd. did well for a while and then went into a decline. The exact change point into the decline coincided with a change to new stockholders and considerable executive and staff turnover. At first glance the Why would have seemed to be so many transfers — musical chairs. However, a complete survey shows that the definitions of Ajax valuable final products were changed from "useful ball bearings sold in quantity at a profit" to "world acceptance of Ajax." The big ad campaigns, internal shop and accounting policy shifts to accomplish this, the new fuzzy ideas about it and failure to spot the Why took Ajax down. Traced further it was found that the new advertising manager had originated this policy and the new board had only a foggy notion of its duties and knew nothing of "valuable final products." The whole company started "manufacturing" acceptance instead of ball bearings. The production shop got more and more idle, more and more neglected, had fewer and fewer men in it. Admin got more and more people and down, down, down went the stats.

A survey of any activity, requesting a list from each member of the company answering the question, "What are the valuable final products of this company?" can reveal much and can show that many are setting policies and doing things in the company name which have no real relation to what the company is doing and therefore drive the activity in contrary and conflicting directions.

After all it is the crew, staff members and workers who do the work. When they have to set their own policy and use their own ideas of the valuable final products, you can get a lot of conflicts and upsets which should never exist.

Make no mistake: An activity can be totally unmanageable and become nonviable over just these points. Possibly all labor–management upsets come from them.

1. Policy is set by top management after experience and agreed upon by others. Where policy is needed it should be requested from the top, not set independently by the supervisors or workers.

2. The valuable final products of an activity must be *very* carefully surveyed, established and clearly released at policy level AS POLICY.

Anarchy appears to fail (as it did before the Spanish revolution 1936) and strong central management succeeds around this one point of policy. Everyone sets his own in an anarchy. Businesses succeed only on that point and the precise establishment of valuable final products.

When the exact valuable final products are known and agreed upon, only then does successful group action become possible.

The car industry looks easy. The valuable final product is a car. But automotive labor and unions have not agreed to that. Their "valuable final product" is "a big paycheck." This one point damaged and may have irreparably destroyed the US economy in 1970 when General Motors, the country's largest industry, had a walkout and layoff. Failing to handle this one point GM management was failing duty as management (they lost their general manager last year due to a Ford maneuver of hiring him over, then firing him). Labor in this case ruined their future paychecks and lost thousands of jobs.

Forty years ago a similar inability to set policies and establish valuable final products began to wipe out the coal industry in the US. Under a John L. Lewis, the miners made coal mining economically impossible. Management, mostly absentee and careless, half a century before that had begun to make errors, run unsafe mines and look on an appearance in society pages as a valuable final product. Today "Appalachia" is a ruined poverty area. And oil is the fuel—of which there is little compared to US domestic coal.

So do not discount these two points. They are capable of wicked backlashes when not done right. They are the Why of not only organization failures but also the failures of civilizations.

PRECISE WORDING

The valuable final products of any activity small or large must be very precisely and totally listed and totally continually posted.

The valuable final products of a division should be on the org board under the division and the valuable final products of the org should be on the org board in a glaring red list.

Let us take a college. US colleges and others are so clouded up with "government projects" and "scientific findings" and "published papers" and "sport wins" and "general public awe of their greatness" that they have pretty well forgotten a "well-trained and successful student in the field of his major." So the student body product becomes "revolt." And the college product becomes "???" in the public mind. I do not speak idly. The very last thing a college wants in a student is one who is an individual success. A downtrodden anonymous member of some industrial team or an underpaid professor is about as high as a college will tolerate from their student bodies according to surveys. For several hundred years, since Francis Bacon (1561–1626) in fact, there has been no renowned philosopher who had not been eased carefully out of his college long before graduation. The list exceptions are tame sellouts like Dewey, part of the Leipzig death camper crew.

So here is civilization at risk. The valuable final product of its educational institutions is not stated and is neglected in favor of a multitude of false or valueless products. They are not known by their students but by their arrogance and political connections. This is not idle data. Failure to understand this fact of valuable final products began around 1862, the downfall of imperial Russia, spearheaded by its college students. Having no real valuable final product, clearly stated and agreed upon, opens the door to conflict not only in the company but in the state and the entire civilization. (Granted, imperial Russia stank, which is my exact point. So did Stalinism.)

Studying back and forth over history, poking about in old ruins, remembering, adding it up, the apparent causes of organizational decay are:

a. Failure to have an informed, trained top management capable of setting real policy in accordance with the need of the organization.

b. Failure of top management to set policy.

c. Company members, supervisors and workers setting their own policy out of agreement with or in ignorance of the needs of the organization and themselves.

d. Failure of top management to wisely, completely and precisely establish the valuable final products of the activity.

e. Ignorance of or disagreement with the valuable final products by workers and company members.

In a much more general sense we would have:

A. Unwise or unset policy.

B. Unreal or unstated or undone valuable final products.

These apply to any organization of any size. The most flagrant offenders are governments. I have never met a political leader or police officer who had a clue about valuable final products of the state. You or I might feel that "public safety" was a valuable final product of police, but the police don't say so.

In amongst psychiatry I have worked for hours trying to make numerous psychiatrists state what they were trying to accomplish. I have never even gotten one to hazard even a suggestion of why he was doing what he was doing, much less say "a cured patient" or "a safeguarded society."

The confusion on these points of valid policy and valuable final product is so great in the world of this writing as to be intolerable.

So do not feel strange that in our early organizations it has been hard to handle things — they were cheek by jaw with a society that believed itself a jungle and where "moral" standards were being set by the psychiatrists who gave the world Hitler and twelve million exterminated Germans.

When the society goes in this direction (war, murder, psychiatry) it conceives its valuable final product to be dead men.

Thus it is very, very important for us to get these hitherto obscure or unidentified principles up into the light where they belong and to USE them.

1. The beings of top management must be fully informed and capable of setting or knowing and publishing policy according to the need (including viability) of the organization which will be agreed upon by the whole activity. This means an informed, trained top management and includes org management.

2. Top management and managers must KNOW policy and be able to set or request policy where it is unknown or nonextant.

3. All members (top management, managers, supervisors, technicians, workers) must understand the mechanisms of setting policy, how to get it set, know policy that is set and know what is valid policy and who sets it.

4. The valuable final products of an organization must be known to, precisely and completely established and defined by top management.

5. The valuable final products of an activity must be known fully to and agreed upon by all beings in the organization including why and the abandonment of random products which are being done but which do not in any way add up to valuable final products.

ECONOMICS

The economics of any group is such that it cannot tolerate offbeat products and remain sound. This is true of any political group or commercial company.

All of the activities of a group in some way must add up to known valuable final products of a group or it will, as an entity, shatter.

Even in a "moneyless state," a barter economy, this remains factual.

Western civilization and Eastern alike have decayed on the altars of war gods. Diplomatic and political incompetence have squandered their efforts and brought them to inflation and then dust. A socialism where the population goes unshod or a capitalism where a barrowload of bucks will not buy a loaf of bread are paying for ignorance of their actual valuable final products and the squandering of funds and effort on side issues.

One cannot appropriate or apportion funds without an intimate knowledge of the valuable final products of the activity.

One cannot handle property unless one knows the valuable final products of the activity.

One cannot assign personnel without huge waste of manpower unless one knows the valuable final product.

Therefore *one must* be able to list and know the valuable final products of an activity before one can:

i. Do financial planning.

ii. Arrange, buy or sell property.

iii. Allocate spaces assigned for different functions.

iv. Assign personnel.

If one tries to do these things first and discover final products later, all efforts to organize will be cancelled.

CENTRAL AUTHORITY

The valuable final products must be agreed upon and issued as policy and additions to the list must be referred to the policymaking level of the group before being confirmed as valid.

The aimless meanderings of contemporary societies show the absence of such lists. It some time ago began to be stated and believed that society "just took in each other's washing"; and the joke, Parkinson's Law, in which bureaucracy multiplies automatically, both give evidence that society is believed not to have any valuable final products even as faint as "a good life."

Individual members of a group or society must know the valuable final products of the activity and must be in some agreement with them to have a successful group.

SURVEYS

Surveys of what should be the valuable final products show mainly the spirit of the matter. It should not be believed for a moment that a standard survey would apply: a standard survey being the adding up of the answers and taking the majority as useful.

Such a survey measures willingness concerning types or directions of activity.

Given this, setting the exact *things* the group can or should produce and wording them exactly requires a lot of looking and a lot of work.

What products of the group are economically *valuable?* This is the key point that will be overlooked. What, in short, can this group exchange with other groups or society that will obtain things the group does *not* produce? This is the heart of economics. The law of supply and demand applies.

This is too hardheaded an approach for a whole group to decide upon without a great deal of personal work.

If the group has a past to assess, then it will previously have produced products from time to time that did demonstrate economic value. A search for and a list of these is of primary value.

If the group has no past, it has some experience available from the society which it can employ.

It can be taken as a rule that group members will not identify or phrase the valuable final products. And it can be taken as another rule that it will in the course of time lose those products from its production that were valuable.

Final is another word that will probably escape grasp. Subproducts leading to final products will be given equal billing with the final product.

So three surveys have to be done.

What does the group think its final product should be? This gives willingness and direction.

What have been the previous valuable final product successes of the group? (That did exchange with other groups so the producing group can obtain things it does not produce.) This in a new group would be a survey of what similar groups have produced.

There would then be a period of intense and expert work by or for central policy authority where questions like: Have times changed? Were these items ever thoroughly offered? What was the relative value in light of their cost? Is recosting necessary due to money value changes? Which ones really brought value back to the group from others? Can we still produce these? Thus a list is drawn up, precisely worded.

Then the final (3rd) survey can occur. This is the issue of the reworked list above to the group to get them to look at it from their viewpoint and see if it is feasible and any points missed and any expert opinion taken amongst the experts in the group.

The final list of valuable final products could then be drawn and issued as policy.

A special watchdog production tally officer could then be appointed to make sure *these* valuable final products are being prepared for and produced.

Yes, it would take all that to get the list of valuable final products of an activity.

The valuable final product list does not come wholly from top management.

The list does not come only from the group.

Major social and business catastrophes occur when (a) no list is set, (b) top management only sets the list or (c) the group sets the list up.

Phrases like “a better world” or “a big car” or “lots of customers” are quite incomplete and unreal. Even the words “an auditor” or “a release” are correct but are not fully enough described to be good statements of a valuable final product.

A notable example of all this occurred in the car industry when Edsel Ford, ten years ago, did not survey past products and current demands and produced “The Edsel.” Henry Ford half a century earlier had established the company products as a cheap, small, rugged automobile that would put America on wheels and a big, expensive car to hold up the company image. “The Edsel” went in between and millions were lost and scores of dealers were wiped out. No survey. No precise product.

If all this seems commercial, remember that in any civilization a group has to buy or acquire those things it does not produce. This is true in capitalism, communism or tribal barter. There is no Santa Claus and even a corn and games welfare state can go broke and always has.

Thus the *valuable* final product of a group must be valuable to another group or individuals in society around it and sufficiently so that it can receive in return things it wants or needs but does not produce. And it must DELIVER its valuable final product, a point most often missed.

A group of knights in a castle on a hill had protection for the peasant as a valuable final product. When they ceased to deliver and used only threat and robbery the peasant eventually invented a longbow whose arrow could penetrate armor and knighthood was no longer in flower.

All this is really quite simple. It is even in the Factors.

THIRD DYNAMIC DE–ABERRATION

The exact mechanism of 3rd dynamic (group or organization) aberration is the conflict of COUNTER–POLICY.

Illegal policy set at unauthorized levels jams the actions of a group and IS responsible for the inactivity, nonproduction or lack of team spirit.

Counter-policy independently set jams the group together but inhibits its operation.

Out-reality on org bds, hats, etc., is to a large degree caused by disagreements and conflicts which are caused by illegal policy.

If we had a game going in which each player set his own rules, there would be no game. There would only be argument and conflict.

VARIETIES OF COUNTER–POLICY

At the start it must be assumed or effected that there is someone or some body to set authorized policy for the group. Absence of this function is an invitation to random policy and group conflict and disintegration. If such a person or body exists, new proposed policy must be referred to this person or body and issued, not set randomly at lower levels or by unauthorized persons.

Policies so set by the policy authority must be informed enough and wise enough to forward the group purpose and to obtain agreement. Ignorant or bad policy even when authorized tends to persuade group members to set their own random policy.

When no policy at all exists random policy occurs.

When policy exists but is not made known, random policy setting will occur.

Ignorance of policy, the need or function of it, can cause random policies.

Hidden not stated random policies can conflict.

Correct policy can be relayed on a cutative basis — a few words left off or a qualifying sentence dropped which makes policy incorrect or null. "Children may not go out" can be made out of "Children may not go out after midnight."

Altered policy can be limitless in error.

Attributing a self-set policy to the authorized source can disgrace all policy as well as pervert the leadership purpose.

Policy can be excluded from a zone of a group that should be governed by it. "Pipe-making policy does not apply to the *small* pipe shop."

Such masses of unnecessary policy can be issued that it cannot be assimilated.

Policy can exist in large amounts but not be subdivided into relevant subjects as is done in hat checksheets.

Disgrace of policy can occur in a subsequent catastrophe and render any policy disgraceful, encouraging self-set policy by each group member.

CLEARING A GROUP

All authorized policy must be set or made available in master books and adequate complete policy files. This makes it possible to compile hats and checksheets and issue packs.

Group surveys of "What policy are you operating on?" can reveal random policy.

All bugged (halted) projects can be surveyed for illegal policy and cleaned up and gotten going again.

Other actions can be taken all of which add up to:

1. Get existing policy used.
2. Get areas without policy crisply given policy from the authorized source.
3. Debug all past projects of false policy.
4. De-aberrate group members as per the Organization Misunderstoods PL and other materials.
5. Educate the group members concerning policy technology.
6. Set up systems that detect, isolate and report out-policy and get it corrected and properly set, issued and known.
7. Monitor any new policy against statistics and include policy outnesses as part of all statistical evaluations.

ADMIN SCALE

I have developed a scale for use which gives a sequence (and relative seniority) of subjects relating to organization.

GOALS
PURPOSES
POLICY
PLANS
PROGRAMS
PROJECTS
ORDERS
IDEAL SCENES
STATS
VALUABLE FINAL PRODUCTS

This scale is worked up and worked down UNTIL IT IS (EACH ITEM) IN FULL AGREEMENT WITH THE REMAINING ITEMS.

In short, for success, all these items in the scale must agree with all other items in the scale on the same subject.

Let us take "golf balls" as a subject for the scale. Then all these scale items must be in agreement with one another on the subject of golf balls. It is an interesting exercise.

The scale also applies in a destructive subject. Like "cockroaches."

When an item in the scale is *not* aligned with the other items, the project will be hindered if not fail.

The skill with which all these items in any activity are aligned and gotten into action is called MANAGEMENT.

Group members only become upset when one or more of these points are not aligned to the rest and at least some group agreement.

Groups appear slow, inefficient, unhappy, inactive or quarrelsome only when these items are not aligned, made known and coordinated.

Any activity can be improved by debugging or aligning this scale in relation to the group activity.

As out-reality breeds out-comm and out-affinity, it follows that unreal items on the scale (not aligned) produce ARC breaks, upsets and disaffection.

It then follows that when these scale items are well aligned with each other and the group there will be high reality, high communication and high affinity in the group.

Group mores aligned so and followed by the group gives one an ethical group and also establishes what will then be considered as overts and withholds in the group by group members.

This scale and its parts and ability to line them up are one of the most valuable tools of organization.

When orders are not complied with and projects do not come off, one should DETECT, ISOLATE and REPORT and handle or see that it is handled, any of the scale items found random or counter.

If any item below POLICY is in trouble — not moving — one can move upwards correcting these points, but certainly concentrating on a discovery of illegal or counter-policy. Rarely it occurs some old but legal policy needs to be adjusted. Far more commonly policy is being set by someone, verbally or in despatches, or hidden, that is bugging any item or items below the level of policy.

So the rule is that when things get messed up, jammed up, slowed or inactive or downright destructive (including a product as an overt act) one sniffs about for random or counter-policy illegally being set in one's own area or "out there."

Thus in the face of any outness one DETECTS — ISOLATES — REPORTS and handles or gets handled the out-policy.

The *detection* is easy. Things aren't moving or going right.

The isolation is of course a WHAT POLICY that must be found and WHO set it.

Reporting it would mean to HCO.

Handling it is also very easy and would be done in Qual.

This admin tech gives us our first 3rd dynamic de-aberrater that works easily and fast.

Why?

Well, look at the Admin Scale. *Policy* is just below *purpose*.

Purpose is senior to policy.

The person who is setting random or counter illegal policy is off group purpose. He is other-purposed to greater or lesser degree.

From 1960 to 1962 I developed a vast lot of technology about goals and purposes. If we define a goal as a whole track long long-term matter and a purpose as the lesser goal applying to specific activities or subjects we see clearly that if we clean up a person's purposes relating to the various activities in which he is involved and on the eight dynamics we will handle the obsession to set random or counter-policies!

So it is an auditing job and the tech for it is extensive. (The African ACC was devoted to this subject. Lots of data exists on it.)

It happens however that around 20 percent (probably more) of any group's members are actively if covertly antigroup and must be handled at a less profound level under "personal aberration" in the Org Misunderstoods policy letter before you can begin to touch purpose.

Thus any group member, since this tech remedy helps them all, would be handled with:

1. General case de-aberration (called L10s on Flag),

2. Purpose handling for posts,

3. Org bd, hatting and training.

Those setting random or counter-purpose later detected would get further no. 2 and no. 3.

As the universe is full of beings and one lives with them whether he likes it or not, it would be to anyone's interest to be able to have functioning groups.

The only way a group jams up and (a) becomes difficult to live in and (b) impossible to fully separate from is by random and counter-purposes.

If one thinks he can go off and be alone anywhere in this universe he is dreaming.

The first impulse of a hostile being is "to leave" a decent group. What a weird one.

The only reason he gets in jams is his inability to tolerate or handle others.

There's no road out for such a being except through.

Thus all we can do to survive even on the first dynamic is to know how to handle and be part of the third or fourth dynamic and clean it up.

Probably the reason this universe itself is considered by some as a trap is because their Admin Scale is out regarding it.

And the only reason this universe is sometimes a trial is because no one published its Admin Scale in the first place.

All this is very fundamental first dynamic tech and third dynamic tech.

It is the first true group technology that can fully de-aberrate and smooth out and free within the group every group member and the group itself.

Thus, combined with auditing tech, for the first time we can rely wholly on technology to improve and handle group members and the group itself toward desirable and achievable accomplishment with happiness and high morale.

Like any skill or technology it has to be known and done and continued in use to be effective.

The discovery, development and practical use of this data has made me very, very cheerful and confident and is doing the same thing on the test group.

I hope it does the same for you.

L. RON HUBBARD

HUBBARD COMMUNICATIONS OFFICE
SAINT HILL MANOR, EAST GRINSTEAD, SUSSEX

HCO POLICY LETTER OF 14 DECEMBER 1970

REMIMEO

PERSONNEL SERIES 14
ORG SERIES 19

GROUP SANITY

The points of success and failure, the make and break items of an organization are:

1. HIRING
2. TRAINING
3. APPRENTICESHIPS
4. UTILIZATION
5. PRODUCTION
6. PROMOTION
7. SALES
8. DELIVERY
9. FINANCE
10. JUSTICE
11. MORALE

These eleven items MUST AGREE WITH AND BE IN LINE WITH THE ADMIN SCALE (HCO PL 6 Dec. 70, Pers Series 13, Org Series 18, THIRD DYNAMIC DE–ABERRATION).

Where these subjects are not well handled and where one or more of these are very out of line, the organization will suffer a third dynamic aberration.

This then is a SANITY SCALE for the third dynamic of a group.

The group will exhibit aberrated symptoms where one or more of these points are out.

The group will be sane to the degree that these points are in.

Internal stresses of magnitude begin to affect every member of the group in greater or lesser degree when one or more of these items are neglected or badly handled.

The society at large currently has the majority of these points out.

These elements become aberrated in the following ways:

1. HIRING

The society is running a massive can't-have on the subject of people. Automation and employment penalties demonstrate an effort to block out letting people in and giving them jobs. Confirming this is growing unemployment and fantastic sums for welfare — meaning relief. Fifty percent of America within the decade will be jobless due to the population explosion without a commensurate expansion in production. Yet production by US presidential decree is being cut back. War, birth control, are two of many methods used to reduce population. THIS THIRD DYNAMIC PSYCHOSIS IS A *REFUSAL TO* EMPLOY *PEOPLE*. EXCLUSION OF OTHERS IS THE BASIC CAUSE OF WAR AND INSANITY.

2. TRAINING

Education has fallen under the control of one-worlders, is less and less real. Data taught is being taught less well. Less data is being taught. School and college unrest reflect this. Confirmation is the deteriorated basic education found in teenagers such as writing. Older technologies are being lost in modern rewrites. THIS THIRD DYNAMIC PSYCHOSIS IS A *COVERT REFUSAL TO TRAIN*.

3. APPRENTICESHIPS

The most successful industries, activities and professions of earlier centuries were attained by training the person as an apprentice, permitting him to understudy the exact job he would hold for a long period before taking the post. Some European schools are seeking to revive this but on a general basis not as an apprentice system. A THIRD DYNAMIC PSYCHOSIS IS A *DENIAL OF* ADEQUATE *EXPERIENCE TO SUCCEED*.

4. UTILIZATION

In industries, governments and armed services as well as life itself, personnel are not utilized. A man trained for one thing is required to do something else. Or his training is not used. Or he is not used at all. A THIRD DYNAMIC PSYCHOSIS IS *FAILURE TO UTILIZE PEOPLE*.

5. PRODUCTION

Modern think is to reward downstats. A person is paid for not working. Governments who produce nothing employ the most people. Income tax and other current practices penalize production. Countries which produce little are given huge handouts. War which destroys attains the largest appropriations. A THIRD DYNAMIC PSYCHOSIS IS *TO PREVENT PRODUCTION*.

6. PROMOTION

Promotion activities are subverted to unworthy activities. True value is seldom promoted. What one is actually achieving gets small mention while other things are heavily promoted. Reality and PR are strangers. A THIRD DYNAMIC PSYCHOSIS IS *UNREAL OR NONFACTUAL PROMOTION*.

7. SALES

Sales actions are unreal or out of balance. Clumsy or nonfunctioning sales activities penalize producers and consumers. In areas of high demand, sales actions are negligible even when heavy advertising exists. This is proven by the inability to sell what is produced even in large countries so that production cutbacks are continual threats to economies and workers. A population goes half-fed in times of surplus goods. With curtailed car factories a nation drives old cars. With a cut-back construction industry people live in bad houses. Sales taxes are almost universal. A THIRD DYNAMIC PSYCHOSIS IS *THE IMPEDING OF PRODUCT DISTRIBUTION TO POTENTIAL CONSUMERS*.

8. DELIVERY

Failure to deliver what is offered is standard procedure for groups in the humanities. Commercially it is well in hand.

9. FINANCE

One's own experience in finance is adequate to demonstrate the difficulties made with money. A THIRD DYNAMIC PSYCHOSIS IS *THE PERVERSION OF FINANCE*.

10. JUSTICE

Under the name of justice, aberrated man accomplishes fantastic injustices. The upstat is hit, the downstat let go. Rumors are accepted as evidence. Police forces and power are used to ENFORCE the injustices contained in 1 to 9 above. Suppressive justice is used as an ineffectual but savage means of meeting situations actually caused by the earlier listed psychoses. When abuses on (1) to (9) make things go wrong, the social aberration then introduces suppressive injustices as an effort to cure. Revolt and war are magnified versions of injustices. Excess people — kill them off in a war. A THIRD DYNAMIC PSYCHOSIS IS *THE SUBSTITUTE OF VIOLENCE FOR REASON*.

11. MORALE

A continuous assault on public morale occurs in the press and other media. Happiness or any satisfaction with life is under continuous attack. Beliefs, idealism, purpose, dreams, are assaulted. INSANITY IS A REFUSAL TO ALLOW OTHERS TO BE, DO OR HAVE.

Any action which would lead to a higher morale has to be defended against the insane few. A THIRD DYNAMIC PSYCHOSIS IS *A DETESTATION OF HIGH MORALE*.

The COMMON DENOMINATOR of all these insanities is the desire to SUCCUMB.

Insanities have as their end product self or group destruction.

These eleven types of aberration gone mad are the main points through which any group SUCCUMBS.

THEREFORE, these eleven points kept sane guarantee a group's SURVIVAL.

EXAMPLES

Seeing all this in one example permits one to see that these third dynamic insanities combine to destroy.

A. Believing it impossible to obtain money or make it, a firm cannot hire enough people to produce. So has little to sell, which is badly promoted and is not sold so it has no money to hire people.

B. Needing people for another job the firm robs them from a plant which then collapses and fails to make money so no new people can be hired. This reduces production so people have to be dismissed as they can't be paid.

C. Persons are in the firm but are kept doing the wrong things so there is little production and no promotion or sales so there is no money to pay them so they are dismissed.

D. A new product is put in. People to make it are taken from the area already making a valuable product which then collapses that area and there is not enough money to promote and selling fails so people are dismissed.

The examples are many. They are these same eleven group insanities in play upon a group, a firm, a society.

SANITY

If this is a description of group aberration, then it gives the keys to sanity in a group.

1. HIRING

Letting people INTO the group at large is the key to every great movement and bettered culture on this planet. This was the new idea that made Buddhism the strongest civilizing influence the world has seen in terms of numbers and terrain. They did not exclude. Race, color, creed, were not made bars to membership in this great movement.

Politically the strongest country in the world was the United States, and it was weakened only by its efforts to exclude certain races or make them second-class citizens. Its greatest internal war (1861–65) was fought to settle this point and the weakness was not resolved even then.

The Catholic Church only began to fail when it began to exclude.

Thus *inclusion* is a major point in all great organizations.

The things which set a group or organization on a course of *ex*clusion are (a) the destructive impulses of about 10 or 15 percent of the society (lunacy) and (b) opposition by interests which consider themselves threatened by the group or organization's potential resulting in infiltration, (c) efforts to mimic the group's technology destructively and set up rival groups.

All these three things build up barriers that a group might thoughtlessly buy and act to remedy with no long-range plans to handle.

These stresses make a group edgy and combative. The organization then seeks to solve these three points by exclusion, whereas its growth depends wholly upon *in*clusion.

No one has ever solved these points successfully in the past because of lack of technology to solve them.

It all hinges on three points: (1) the sanity of the individual, (2) the worthwhileness of the group in terms of general area, planetary or universal survival and (3) the superiority of the group's organization tech and its use.

Just at this writing, the first point is solved conclusively in Scientology. Even hostile and destructive personalities wandering into the group can be solved and, due to the basic nature of man, made better for the benefit of themselves and others.

The worthwhileness of the organization is determined by the assistance given to general survival by the group's products and the actual factual delivery of those valid products.

The superiority of a group's admin tech and its application is at this current writing well covered in current developments.

Thus *in*clusion is almost fully attainable. The only ridges that build up are the short-term defense actions.

For instance, Scientology currently must fight back at the death camp organizations of psychiatry whose solution is a dead world, as proven by their actions in Germany before and during World War II. But we *must* keep in mind that we fully intend to reform and salvage even these opponents. We are seeking to *in*clude them in the general survival by forcing them to cease their nonsurvival practices and overcome their gruesome group past.

There are two major stages then of *in*cluding people — one is as paid organization personnel and one as unpaid personnel. BOTH are in essence being "hired." The pay differs. The wider majority receive the pay of personal peace and effectiveness and a better world.

The org which *ex*cludes its own field members will fail.

The payment to the org of money or the money payment to the staff member is an internal economy. Pay, the real pay, is a better personal survival and a world that can live.

Plans of INclusion are successful. They sometimes contain defense until we *can* include.

Even resistance to an org can be interpreted as a future inclusion by the org. Resistance or opposition is a common way point in the cycle of inclusion. In an organization where everyone wins eventually anyway the senselessness of resistance becomes apparent even to the most obtuse. Only those who oppose their own survival resist a survival producing organization.

Even in commercial companies the best organization with the best product usually finds competitors merging with it.

2. TRAINING

Basic training, hats, checksheets and packs MUST exist for every member of a group.

Criminal or antisocial conduct occurs where there is no hat.

Any type of membership or role or post in the whole organization or its field requires individual and team training. Only where you have a group member who will not or cannot bring himself to have and wear a hat will you have any trouble.

This is so true that it is the scope of Personal Enhancement.

Ask yourself "Who isn't trained on his post and hatted?" and you can answer "Who is causing the trouble?"

Basic training, slight or great, is vital for *every* member of a group, paid or unpaid.

A field auditor must have a hat. A student needs a student hat, etc., etc.

This requires training.

Training begins in childhood. Often it has to be reoriented.

Training as a group member must be done.

Training in exact technology or in the precise tech of admin is not the first stage of training. Basic training of group members, no matter how slight, must exist and be done.

Otherwise group members lack the basic points of agreement which make up the whole broad organization and its publics.

Training must be on real materials and must be rapid. The technology of how to train is expressed in speed of training.

The idea that it takes 12 years to make a mud pie maker is false. TIME in training does not determine quality of training. Amount of data learned that can be applied and skills successfully drilled determine training.

That the society currently stresses *time* is an aberrated factor.

The ability to learn and apply the data is the end product of training. Not old age.

The rate of training establishes to a marked degree the expansion factor of a group and influences the smoothness of the group during expansion.

If training is defined as making a person or team into a part of the group then processing is an influencing factor. The facilities for processing and quantity available are then a determining factor in group expansion.

3. APPRENTICESHIP

Training on post is a second stage of any training — and processing — action.

This is essentially a familiarization action.

To have a person leave a post and another take it over with no "apprenticeship" or groove-in can be quite fatal.

The deputy system is easily the best system. Every post is deputied for a greater or lesser period before the post is turned over and the appointment is made. When the deputy is totally familiar he becomes the person on the post.

Rapid expansion and economy on personnel tend to injure this step. Lack of it can be *very* destructive.

Optimally there should be one or two deputies for every key post at all times. This is a continual apprenticeship system.

Economically it has limitations. One has to weigh the *losses* in not doing it against the cost in doing it. It will be found that the losses are *far* greater than the cost, even though it increases personnel by at least a third for a given organization.

When an organization has neglected it as a system (and has turned over too many posts without deputy or apprenticeship action) its economics may decay to where it can never be done. This is almost a death rattle for an organization.

In a two-century-old highly successful industry, *only* the apprentice system was and is used (Oporto wine industry). The quality of the product is all that keeps the product going on the world market. If the quality decayed the industry would collapse. Apprenticeship as a total system maintains it.

Certainly every executive in an organization and every technical expert should have a deputy in training. Only then could quality of organization be maintained and quality of product guaranteed.

The total working organization should be on this system actually. And whenever a person is moved up off a post, the deputy taking over, a new deputy should be appointed. The last step (appointment of a new deputy) is the one that gets forgotten.

Failure to recruit new people over a period will very surely find the whole organization declining soon solely because there is no apprentice system of deputies. The organization expands, singles up the posts, promotes some unapprenticed people and begins to lose its economic advantage. Low pay ensues, people blow off and then no one can be hired. It's a silly cycle, really, as it is prevented easily enough by hiring enough soon enough when the org is still doing well.

The rule is DEPUTY EVERY POST AND NEWLY DEPUTY THEM WHEN PROMOTIONS OCCUR.

The most covert way to get around this is just to call each person's junior a deputy even though he has other duties. This makes it all look good on an org board. "Do you have each post deputied?" "Oh yes!" But the deputies are just juniors with posts of their own.

A deputy is *used* to run the same post as it is deputied for. This means a double posting pure and only.

You'd be amazed at how much production an executive post can achieve when it is also deputied and when the principal holder of the post will use the deputy and gen him in, not get him to cover an empty lower post.

4. UTILIZATION

People must be utilized.

Equipment must be utilized.

Space must be utilized.

Learning to USE is a very hard lesson for some. Untrained people, bad organization, poor machinery, inadequate space all tend to send one off utilization.

The rule is, if you've got it use it; if you can't use it get rid of it.

This most specifically applies to people. If you've got a man, use him; if you can't use him get him over to someone who can use him. If he isn't useful, process and train.

Anyone who can't figure out how to use people, equipment and spaces to obtain valuable final products is not worthy of the name of executive.

Reversely we get what an executive or foreman is — an executive or foreman is one who can obtain, train and use people, equipment and spaces to economically achieve valuable final products.

Some are very skilled in preparing people, systems, equipment, property and spaces to be used. But if these then go to someone who does not USE them you get a bad breakdown.

The welfare state and its inflation is a sad commentary on "executive ability."

An executive whose people are idle and whose materiel is decaying is a traitor to his people and the org, just that, for he will destroy them all.

UTILIZATION requires a knowledge of what the valuable final products are and how to make them.

Action which doesn't result in a final product that adds up to valuable final products is destructive, no matter how innocent it seems.

Man has a planet as a valuable final product. Improper *use* of the countries and seas, air and masses which compose it will wind up with the destruction of man, all life on it and the usefulness of the planet. So *proper* utilization of anything is a very real factor.

The nineteenth-century industrialist, like the mad kings who built great structures, used up men; they didn't properly use men.

And not using them at all, the current fad, is the most deadly of all.

UTILIZATION is a big subject. It applies to resources, capabilities and many other factors.

The question being asked in all cases is, "How can we USE this to economically obtain a valuable final product?"

Failing to answer that question gives one the "mysteries of life."

5. PRODUCTION

One may be prone to believe there is no sense in any production at all. Such a one would also be likely to say, "There is no sense at all." Or "If they keep on producing it will become impossible to destroy it all."

Production of some final valuable product is the chain of all production sequences.

Even the artist is producing a *reaction*. The reaction's service in a wider sphere to enforce it is what gives art its sense. A feeling of well-being or grandeur or light-heartedness are legitimate valuable final products, for instance.

The production areas and activities of an org that produce the valuable final products are the most important areas and activities of the org.

6. PROMOTION

The acceptance of valuable final products and of their value depends in a large degree upon (a) a real value and (b) a desire for them.

Promotion creates desire for the valuable final product.

The old saw that the man who builds a better mousetrap will have the whole world coming to his door is a total falsity.

Unless the value is made known, and the desire created, the mousetraps are going to go unsold.

Promotion is so important that it can stand alone. It can have limited success even when there is no product! But in that case it will be of short duration.

Promotion must contain reality and the final product must exist and be deliverable and delivered for promotion to be fully successful.

Public relations and advertising and all their skills cover this area of promotion.

7. SALES

It is hard to sell what isn't promoted and can't be delivered.

Economics greatly affect selling.

Anything must be sold for a price comparable to its value in the eyes of the purchaser.

COSTING is a precise art by which the total expenses of the organization administration and production must be adequately covered in the PRICING allowing for all losses and errors in delivery and adequate to produce a reserve.

PRICING (the amount being asked) cannot be done without some idea of the total cost of the final valuable product.

The sale price of one final valuable product may have to cover the cost of producing other products which are delivered without price.

PRICING however does not necessarily limit itself to only covering immediate cost of a product. A painting with a dollar's worth of paint and canvas may have a price of half a million dollars.

Also a painting used in promotion may cost two hundred dollars and be displayed at no cost at all to the beholder.

These relative factors also include the SKILL of the salesman himself and there is much technology involved in the act of selling something to someone and the world abounds in books on the subject.

Therefore sales (once promotion is done) are bound up really in COSTING, PRICING AND SELLING.

The value in the eye of the purchaser is monitored by the desire created in him for it. If this is also a real value and if delivery can occur then SELLING is made very easy — but it is still a skilled action.

The production of a valuable final product is often totally determined by whether or not it can be sold. And if it can be sold at a price greater than the cost of delivering it.

That it *gets* sold depends on the salesman.

The skill of the salesman is devoted to enhancing the desire and value in the eyes of the buyer and obtaining adequate payment.

8. DELIVERY

The subject and action of DELIVERY is the most susceptible to breakdown in any organization. Any flaw on the sequence of actions resulting in a valuable final product may deteriorate it or bar off final delivery.

There are many preparatory or hidden-from-public-view steps on a production line. When any of these break down, delivery is imperiled.

Given the raw materials and wherewithal to make some valuable final product, the valuable final product should occur.

WHEN A VALUABLE FINAL PRODUCT DOES NOT GET PRODUCED AND CANNOT BE DELIVERED, REPAIR THE EARLIER STEPS OF ITS PRODUCTION.

Example: An auditing result is not delivered. Don't just repair the pc. Repair training of auditors and C/Ses. Repair the assembly line *before* the valuable final product. The subproducts are less visible. Yet they add up to the valuable final product.

THE LAW OF THE IRREDUCIBLE MINIMUM occurs in all delivery problems. Someone is trying to produce only the visible end product of a post or production line and neglects the earlier contributory actions and products as these are not plainly visible.

When an organization or its posts operate only on an irreducible minimum, production goes bad and DELIVERY crashes.

Take a cook who has his post at an irreducible minimum. Food is appearing on the table. If he reduced just one bit more the food would no longer be edible at all. He neglects purchasing, menus and preparation. That these occur is invisible to the diners. That food appears on the table is visible to the diners. If the cook operates at any less level than he is, no edible food would be visible — hence, irreducible minimum. The food served will be bad. But it will be visible. Invisible-to-the-diners actions aren't being done.

To improve the food, get the less visible actions *done*. Get the sequence of actions all done. The result will be improved food.

Take training. The final valuable product is a trained auditor. The Course Supervisor who runs his post on an irreducible minimum is simply there, appearing to supervise.

His final product may be horribly unskilled. The teaching may take "forever."

To improve this one goes earlier on the assembly line — materials, packs, tapes, student tech services, recorder repair, scheduling — dozens of actions including getting the Course Supervisor trained.

The visibility is still a Course Supervisor and students being taught. But with the *whole* earlier line in, the final valuable product is excellent!

A being hopes lazily for instantaneous production. It doesn't happen this way in the MEST universe. Things are produced in a sequence of subproducts which result in a final valuable product. Hope all you want to. When you omit the subproducts you get no valuable final product.

When the people in an organization do not know the valuable final products of the org and when a person on a post does not know the final products of his post, a condition arises where no org DELIVERY will occur, or if it does occur it will be poor or costly. It is vital that a person knows what his post final products are and what his unit, section, department and division subproducts are and how his own and each of these contribute to the valuable final products of the organization for actual delivery to occur.

Delivering other than valuable final products or useless final products or final products that need constant correction also adds up to nondelivery.

A whole civilization can break down around the point of DELIVERY. So can an organization.

Since money can be looked upon as too valuable a final product it can actually prevent DELIVERY.

Failure to deliver is the one point beings do not forgive. The whole cycle hangs upon DELIVERY.

DELIVER WHAT IS PROMISED when it is expected, in sufficient volume and adequate quality is the first maxim even of a group in politics or the humanities.

9. FINANCE

Finance too often disregards the other factors in this scale or the other factors in this scale too often disregard finance for organizations to long remain viable.

Financing must be in agreement with all the other factors of this scale and all the other factors must be in agreement with finance for viability to occur.

Because money is interchangeable for commodities then people can confuse it with too many things.

If you regard money like so many beans, as a commodity in itself, you open the door to understanding it.

Money is so many beans in to get so many beans out.

When you can master this you can handle FINANCE.

The FINANCE persons of an org, a civilization, a planet should put so many beans in and expect more beans out than they put in. This is quite correct as a viewpoint for finance.

The difference of beans in and beans out for a planet is made up by adding beans enough to those already in existence to cover new commodity.

When finance people fail to do this beans cease to be in pace with production and inflation and deflation occur.

In an org or any of its parts, industriousness of the staff makes the difference between the beans in and beans out.

An org has to have income greater than outgo. That is the first rule of finance. Violating it brings bankruptcy.

Now if the FINANCE people of an org apply the same rule remorselessly to all *its* transactions (financial planning) with each person and part of an org, finance becomes real and manageable.

So many beans in to support the first division means so many beans out of the org back to finance because of the cooperative work of the first division.

A hectic effort to work only with production products will wind finance up in a knot.

One has to estimate (cost) the contribution of each part of an org to the valuable final product to know what to allow what part of an org.

Finance has to have a full reality on the valuable final products and the subproducts and post products of the whole org to intelligently allocate funds.

This person, that division, each contributes some part of the action that results in the money received for the valuable final products.

So finance can extend so much money for each and expect that and an additional amount back.

If this occurs, so will expansion.

Finance comes unstuck when it fails to "cost" an organization and fails to support valuable final product production.

Finance must not only practice "income greater than outgo" for the org, it must practice it for each part of the org as well.

Then solvency becomes real.

The greatest aberration of finance is that it seeks to *save* things into solvency. The real losses in an org are the sums never made. These are the most important losses for finance to concentrate upon.

An org that makes 500 pounds a week that should make 5,000 pounds a week in potential is losing the finance people 4,500 pounds a week!

Finance can force production along certain lines by putting in funds and getting more back.

Finance becomes too easily the management of an org but it only does that when it ceases to deal in its own commodity — money.

An org which has executives unfamiliar with finance will fall at once into the control of the finance people in the org. And these finance people, if they don't really know money, will fall at once under the control of outside finance people.

One has to know finance in any organization anywhere, even in a socialism. Sooner or later the books get balanced in any society.

10. JUSTICE

Without justice there can be no real organization.

Even a government owes its people an operating climate in which human transactions and business can occur.

Where insane and criminal individuals operate unchecked in the community, justice is uncertain and harsh.

The society in which the insane rise to positions of power becomes a nightmare.

Justice is a difficult subject. Man handles it badly.

Justice cannot occur until insanity can be detected and cured.

The whole task of justice is to defend the honest man. Therefore the target of justice is the establishment of a sane society.

The inability to detect or cure the insane destroys civilizations.

Justice is an effort to bring equity and peace. When one cannot detect and cure insanity then sooner or later justice actions will become unjust and be used by the insane.

To us, justice is the action necessary to restrain the insane until they are cured. After that it would be only an action of seeing fair play is done.

11. MORALE

When all factors balance up in an org and give the group a common direction and mutual viability, morale can be expected to be good.

When the Admin Scale and the ten elements described are out of balance (without proper importance given to each) and when one or many of these (Admin Scale and the elements herein described) are not in agreement one with another, then morale will be poor.

Morale is not made of comfort and sloth. It is made of common purpose and obstacles overcome by the group.

When the Admin Scale and these elements are not held together by similar aims, then morale has to be held up artificially.

The most ghastly morale I have ever seen was amongst "the idle rich."

And the highest morale I've ever seen was amongst a furiously dedicated common-purposed group working under fantastic stresses with very little against almost hopeless odds.

I used to observe that morale in a combat unit would never materialize before they had been through hell together.

All drama aside, morale is made up of high purpose and mutual confidence. This comes from the Admin Scale items and these elements of organization being well aligned, one with the next, and honest sane endeavor to achieve a final goal for all.

ENVIRONMENTAL CONTROL

The differences between a competent person and an incompetent person are demonstrated in his environment (surroundings).

A person is either the effect of his environment or is able to have an effect upon his environment.

The nineteenth-century psychologist preached that man had to "adjust to his environment." This false datum helped begin a racial degeneration.

The truth is that man is as successful as he adjusts the environment to him.

Being competent means the ability to control and operate the things in the environment and the environment itself.

When you see things broken down around the mechanic who is responsible for them, he is plainly exhibiting his incompetence — which means his inability to control those things in his environment and adjust the environment for which he is responsible — motors.

When you see the mate's boats broken up, you know he does not have control of his environment.

Know-how, attention and the desire to be effective are all part of the ability to control the environment.

One's "standards" (the degree of rightness one is trying to establish and maintain) are directly related to one's desire to have a controlled environment.

The attainment of one's *standards* is not done by criticism (a human system). It is done by exerting control of one's environment and moving things effectively toward a more ideal scene.

Control of the environment begins with oneself — a good case state, a body that one keeps clean and functioning. This extends to one's own gear, his clothing, tools, equipment. It extends further to the things one is responsible for in the environment. Then it extends out into the whole environment, the people and the MEST.

One can get pretty dirty fixing things up. That's okay. But can one then also clean oneself up?

The ability to confront MEST is a high ability. After that comes the ability to handle and control it.

The ability to confront people is also a high ability. After that comes the ability to get along with them and to handle and control them.

There is the supreme test of a thetan — the ability to make things go right.

The reverse of this is the effort to make things go wrong.

Incompetence — lack of know-how, inability to control — makes things go wrong.

Given some know-how or picking it up by observation, sane people make things go right.

The insane remain ignorant intentionally or acquire know-how and make things go wrong.

Insane acts are *not* unintentional or done out of ignorance. They are intentional, they are not "unknowing dramatizations." So around insane people things go wrong.

One cannot tell the difference really between the sane and insane by behavior. One can tell the difference only by the product. The product of the sane is survival. The product of the insane is an overt act. As this is often masked by clever explanations, it is not given the attention it deserves. The pretended good product of the insane turns out to be an overt act.

A large percentage of this planet's population (undetermined at this time for the "general public" but in excess of 20 percent) are insane. Their behavior looks passable. But their product is an overt act. The popularity of war confirms this. The products of existing governments are mainly destructive. The final product of the human race will be a destroyed planet (a contaminated air cover rendering the planet unable to sustain life, whether by radiation or fumes).

Thus, due to the inability to detect and handle the insane, the sane majority suffers.

The hidden actions of the insane can destroy faster than an environment can be created UNLESS one has the know-how of the mind and life and the tech of admin and the ability and know-how to handle MEST.

An area or activity hit by an influx of new recruits or new customers tends to unsettle. Its MEST gets abuse, things go out of control.

Gradually, working to put in order, the standards are again being attained. The minority insane get handled, the know-how of groups and orgs becomes more generally known, the tech of MEST gets used again.

As an organization expands it goes through cycles of lowered condition and raised condition. This is normal enough since by taking on more and more area one is letting in more and more insane even though they are in a small proportion to the sane.

NAVIGATE
FIRST PAGE
SEARCH

AGAIN
EXIT
CONTENTS
ORG BOARDS
INDEX

Order is reestablished and survival trends resumed to the degree that the sane begin to reach out and handle things around them and as the insane are made sane.

Thus one gets downtrends and uptrends. As soon as a group begins to feel cocky, it takes on more area. This includes more unhandled people, admin and MEST and a downtrend begins. Then the sane begin to handle and the insane begin to be sane and the uptrend starts.

This is probably even the basis of national economic booms and depressions.

This is only bad to the degree that the insane are put in charge. As soon as this happens the downtrend becomes permanent and cultural decay sets in.

A group expanding rapidly into a decadent culture is of course itself subjected to the uptrend–downtrend cycles and has to take very special measures to counteract the consequences of expansion in order to maintain any rate of growth.

The individual member of a group can measure his own progress by increased ability to handle himself, his post and environment and the degree of improvement of the group itself because of his own work within it.

A group that is messing up its gear and environment worse than it did a while ago and is not improving it of course has to be reorganized before it perishes.

No group can sit back and expect its high brass to be the only ones to carry the load. The group is composed of individual group members, not of high brass.

The survival of a group depends upon the ability of its individual members to control their environment and to insist that the other group members also control theirs.

This is the stuff of which survival is made.

A sane group, knowing and using their technologies of handling men and MEST, cannot help but control their environment.

But this depends upon the individual group member being sane, able to control his MEST and those around him and using the tech of life, the tech of admin, the tech of specific types of activity.

Such a group inevitably inherits the culture and its guidance.

REMIMEO

PERSONNEL SERIES 17
ORG SERIES 21

DUPLICATING FUNCTIONS

All you have to do to run out of personnel, finance and get no production is to duplicate the same functions that give the same product in an org.

Take three orgs side by side under the same management. Only if each division of each org had entirely different products would this be possible.

Now let's do it wrong. Each of these three orgs has an HCO and full personnel duties. Each separately promotes. Each has its own finance office, each has its production div producing the same products. Each has its own correction div — the place in general would be very overmanned, yet each div would be undermanned for its full functions. The product would be terrible if it existed at all. Morale would be ghastly, interorg collisions continual.

The right way would be to work out the different products and then assign them to one or another of these orgs. One org would have to be the source org that produced the other two. One org would have all the finance with liaison only in the other two orgs. One org would have to hire, hat and train with only liaison in the other two. The orgs would have org boards which *had* the function but under it would be the note "Liaison with _____," source org.

In the impatience and emotion of organizing one org tends to individuate and establish a duplicate function because "it can't get service." This begins the catastrophe. Now they'll all begin to go broke while having men bulging out of the windows.

In looking over potential insolvency, look over duplicate functions.

HCO POLICY LETTER OF 25 JANUARY 1971

REMIMEO

ORG SERIES 22

SQUIRREL ADMIN

When a squirrel is given a circular wheel he will run in it 'round and 'round and 'round. He gets nowhere.

When persons in an organization do not know organizing or their org board or hats, they go 'round and 'round and 'round and get nowhere.

There is no valuable production. There is no money.

When you have an organization that has no valuable production you know that the people there go 'round and 'round and 'round and get nowhere.

They are squirrel administrators.

STANDARD ADMIN

There are right ways to handle a group. This is the single fact which most often escapes people attempting to handle groups.

Also, for every correct solution there can be an infinity of wrong solutions.

The right way is a narrow trail but strong. The wrong ways are broad but all lead into a bog.

You could "fix" a radio by hitting it with a sledgehammer, putting a hand grenade in it or throwing it out of a 155th-story window. The number of wrong ways you could "fix" it would be infinite.

Or you could find out what was wrong with it and replace the part or properly correct it.

The difference between the wrong way and the right way is that the radio, wrongly "solved," doesn't work. The radio correctly solved works.

So the test of the wrong way or the right way is whether or not the radio then worked.

This is the basic test of *all* administrative solutions. DID THEY WORK?

When experienced persons, working from basic theory, have evolved a technique for handling a situation which routinely now handles that situation, we have now a STANDARD ADMINISTRATIVE ACTION.

When that situation appears, we apply *that* solution and the matter gets handled.

The test is, did the solution work?

Solutions that work and are therefore routinely used to handle the situation to which they apply are then called STANDARD ADMIN.

A multitude of these correct solutions are used in STANDARD ORGANIZING. The org board, the hats, comm lines, comm centers, comm baskets, despatch forms, routing forms, inspection actions, promotion actions, central filing, customer or visitor handling, selling, collecting income, paying bills, inventorying, doing finance reports, handling raw materials, training persons to handle and properly change materials, correcting or improving staff competence, correcting organizational form, inspecting, reviewing and handling failed products, handling contacting and converting the publics, establishing and using field distributors and salesmen, providing public services, maintaining contact with the original and basic technology, handling rivals and opposition, and running the organization in general *all* have standard actions.

Now, glancing over the above rough list, you see we have hit the high spots of a 21-department, 7-division org bd.

Each *is* a standard solution to continuing and recurring problems.

Each contains numerous standard solutions to the recurring problems associated with them.

Underneath all this is basic theory and around it is survival and potential success.

USE OF STANDARD ACTIONS

The difference between a successfully viable organization with cheerful and cared for staff and a limping scene is standard and squirrel administration.

If standard admin is successful then why is it sometimes not used?

First the data has to exist, be available and known.

Next the data has to be used.

At first glance this may seem so clear-cut that it cannot go wrong. But one must look a bit further.

One is dealing with a variable called man. One is working in a world full of noise and conflict.

Certain personalities do not want the group or the organization to succeed (see HCOB 28 Nov. 70, C/S Series 22, PSYCHOSIS). This problem has been so great amongst men that every historical culture — each one an organization — has died. About 10 to 20 percent of mankind, at a broad guess, fit into this category.

In this universe it is easier to destroy than to construct. Yet the survival of life forms depends on construction.

To overcome this, man has developed technology and the cooperative effort known as organization.

The forces of the physical universe can be channeled and used only with technology.

The forces inherent in life forms can succeed only when channeled and aligned with one another.

Therefore to succeed a group must have the technology it uses available and known to it. And then use it.

From this, one obtains the agreement and alignment necessary to generate the group action and production which brings about success.

NONCONFRONT

When a group member has the data, the bar to his using it would be his own disagreement with the group succeeding or, more frequently, his inability to confront things.

EXAMPLE: Two group members are quarreling. A third group member seeks to handle it. Even though he knows the technique (third party law), his own inability to confront people makes him fail to use the correct solution and he backs off.

In backing off he thinks of some nonconfront, nonstandard "solution" such as firing them.

He has become a squirrel administrator.

EXAMPLE: The plant machinery is in bad shape. It is deteriorating to such an extent that it soon will cease to run. The mechanics plead for money to repair. The plant manager unfortunately cannot confront machinery—he not only "doesn't know about it" but it frightens him. He does not financially plan its full repair on a gradient back to an ideal scene. He simply dreams up the vague hope a new type will be invented. He does nothing. The machinery now costs more to run than it produces. The plant fails. The plant manager was a squirrel administrator.

So we have various causes of failure:

1. A secret desire to destroy,
2. The nonexistence of technology,
3. Nonavailability of the technology,
4. Ignorance of the technology even when available,
5. Failure to apply the technology even when available and known because the being cannot or does not confront the people or the portions of the physical universe concerned.

The existence of any of these things brings a group toward squirrel administration.

Natural cataclysms or political or social catastrophes or upheavals are the other two points which can bring about a failure, but even these can be planned for and to some degree handled. The future possibility of these must also be confronted in order to be circumvented.

EXIT
CONTENTS
ORG BOARDS
INDEX

Any successful organization will be fought by the society's fancied rulers or enemies. This is something which should be taken in stride. The ability to confront these discloses that standard administrative actions exist for these two.

DRILLS

Thus an administrator or staff member, even when the group's tech is available and known, must be able to confront and handle the confusions which can occur and which invite a turn-away and a squirrel solution.

Even this situation of the inabilities to confront and handle can be solved by third dynamic (group) drills and drills on the sixth dynamic (physical universe).

The drills would be practices in achieving general awareness and confronting and handling the noise and confusions which make one oblivious of or which drive one off and away from taking standard actions.

COMPETENCE

Competence is increased in the individual and the group by successes.

Successes come from anticipating the situation and handling it.

Standard admin is the key to competence and successes in an organization.

ORG SERIES 23

LINES AND TERMINALS

There is a scale concerning lines and terminals.

ASSOCIATED TERMINALS
Handling flows and correctly changing particles.

GROUPED TERMINALS

LINES

PARTICLES

SIGNIFICANCES

FALSE TERMINALS

MISDIRECTED LINES

WRONG PARTICLES

FALSE SIGNIFICANCES (RUMORS)

MYSTERIOUS TERMINALS

CHAOTIC LINES

MENACING PARTICLES

DANGEROUS IMPRESSIONS

NONEXISTENT TERMINALS

NONEXISTENT LINES

NONEXISTENT PARTICLES

UNCONSCIOUS IMPULSES

THE CHAOS OF UNHAPPY NOTHINGNESS

Any organization and any individual staff member thereof is somewhere on this scale.

The trick of the scale is the awareness factor. At a position on the scale, the being or org is NOT AWARE of the scale levels above him.

Thus an organization *at* "Mysterious Terminals" is unaware of "False Significances" or anything else above "Mysterious Terminals." Thus an org or individual at "Mysterious Terminals" is unaware of any falsity or any oddity in significances or ideas.

Any level is the effect of any level ABOVE IT.

Any level is slightly at cause over any level below it.

Thus a well-organized group is not at effect and can make an effect upon any group below it in awareness on the scale.

CAUSES

There are several causes for lower positions on the scale.

The first cause is degree of *personal aberration* where a personnel is willfully throwing the terminals, lines, particles and significances into disarray. Show me how he regards terminals, handles particles or routes and I will know how sane or crazy he is. The significances given to terminals, handling particles and lines is a direct index of sanity.

The second cause is *unawareness*. Drills on lines and terminals were once thought to *improve* awareness. This is no longer held to be true. Drills have to be done to BRING ABOUT awareness. People are not naturally aware of other people, lines, various particles or ideas. Due to a century of psychological instruction from childhood that they are animals and after thousands of years of the "upper classes" regarding them as such, people tend to favor a dangerously low or nonexistent awareness. A sort of jurisprudence has been in effect that it is safer to be unaware as then one is "not guilty." A humanoid who has just run over a child has a first response of "I didn't see him." This is highly nonsurvival. If one never notices safes about to fall on him he is soon dead. And painfully so. Unawareness is a sort of blindness where the person looks like he is looking but sees nothing. Degrees of this exist. One can make a terrible lot of errors with this. Mr. A appears to the observer to be noticing, smelling things and hearing whereas he *registers* no sights, has a blind nose and tunes out all sound. "Did you read it?" "Yes." "What did it say?" And you hear a lot of things then that weren't on the paper. There are even degrees of registry. A person appears to see and yet doesn't. A person appears to see and on being asked will say what he saw but can be unaware of seeing, registering or saying he saw! This drives teachers quite mad. One has the glib student who can parrot but cannot apply. This is a surface registry without awareness. Thus drills such as the Admin Training Drills or dummy runs on lines are needed to bring about awareness. A few very sane fortunate fellows can see, register, understand and handle correctly without any drills at all. Others need drills to bring about awareness below a superficial response. To unaware people, terminals, lines, particles and significances just don't exist.

The third general category is *delusion*. One sees A and believes it to be G. This is a lower band of self-protection. Some workers (an awful lot of them) will only take jobs which are mechanical "so they can daydream." Their concept of a terminal is an altered terminal. A line goes somewhere else. A particle is something else. And an idea is really another idea. Such people are incapable of duplication. Say "I see the cat," they hear "Cars are dangerous." They aren't really crazy. They just register alterations of what they perceive.

The person who can attain the state of awareness of terminals as they are, lines as they should be, particles as they exist and significances that are the intended significances are very valuable people. An ideal group can be made up of such people.

CONSTRUCTIVE ACTIONS

An organization consists of terminals, lines, particles and significances.

An AGREEMENT factor has to be established and the group has to be aware of it and use it.

This agreement factor would consist of:

1. Purposes of the group,
2. A list of the hats including a short statement of the purpose and function of each post,
3. A full list of the particles handled by the group and the changes expected at each point of flow,
4. The flow lines of the particles being handled and changed,
5. The significances (technologies) of the group to form, flow and change particles.

If an org officer does not compile these five things and make them fully known and agreed to by all in the group, no organization will form or work.

Thus the PLAN of the group has to be laid out and drilled and known or no organization will form.

One will just have a group of individuals colliding with each other with no production.

The greatest source of confusion in a group are intermediate seniors who knock hats off faster than they can be gotten on and lines out before they can flow, all simply out of ignorance of the general plan of the organization.

Those who cannot perceive one or more of the above five points or bodies of data have to be drilled into awareness of them and dummy run.

Those who are quite crazy will frantically fight the hatting, stringing of lines and changing of particles and will inject mad significances into it all.

So the answer to how to make a group into an organization is to handle the insane one, prepare the five layouts named above, drill and dummy run *everyone* in the group on its *entire* pattern and expertly hat the specialist actions required at each point of change.

Then one has an organization that can produce and be viable.

ORG SERIES 23-1

DRILLS

(Originally written by LRH for the *Apollo* OODs on 26 Feb. 71. Issued as an HCO PL on 3 Nov. 80.)

Refs:

HCO PL	25 Jan. 71	Org Series 22 SQUIRREL ADMIN
HCO PL	16 Feb. 71	Org Series 23 LINES AND TERMINALS

Drills have several purposes. To groove in a team action is a principal one. To test a system fully. To groove in lines.

Whenever postings are changed, the new post holders have to be grooved in on their posts (hatted and on-post trained) and then the team itself must be drilled.

The two steps are always needed.

This applies to org lines as well. Dummy runs and dummy bullbait runs serve as the drill.

PROD–ORG HATS
TECH HATS
QUAL HATS

ORG SERIES 24

LINE DESIGN
HGC LINES, AN EXAMPLE

The present lines for the HGC in any org are the subject of HCOB 5 Mar. 71, Auditor Admin Series 10, C/S Series 25, THE FANTASTIC NEW HGC LINE, which is to be considered part of this policy letter.

This modifies early Tech org boards to some extent.

The old line in '65 policy did not include a Case Supervisor as such and shunted failed pcs to Qual Review.

Today Tech does its own pc repairs and Qual concentrates on cramming HGC auditors as well as students. Qual can also cram the Tech C/S.

It is completely amazing that a statistic ceiling on well done auditing hours delivered could not have exceeded 250–300 well done hours a week no matter how many auditors were hired or posted. The post of the C/S overloaded and the D of P post could not function well without overload.

The new line is capable of a statistic ceiling of 600 to 800 well done hours a week. After that a new second HGC is manned fully and given new space.

The importance of a properly formed line, traveling in correct sequence is then driven home.

An improper line will reduce the statistic ceiling by ½ to ⅓ of what can be achieved by the same number of people.

The overload of seniors usually occurs because of improperly set up lines.

Lines are invisible to most people and they are unable to conceive of them until given full drills.

Unless this new C/S line is used you will not be able to average more than 250 well done hours a week no matter how many auditors you put in the HGC. The auditors will be idle, confused and causing upsets.

If an org cannot get more than 250 well done hours a week, it will find that it cannot really make money from processing.

Thus the new line will give volume, quality and viability in processing pcs.

Advantages of the line are that one HSST can handle up to 30 auditors. The earlier ceiling was 8 or 10 auditors.

With higher volume, backlogs vanish rapidly.

The admin personnel in the line can be afforded.

Line design, then, is a strong and unsuspected cause of low statistic ceilings.

Product and org officers must be intimately familiar with this HGC line. And they must be aware of the fact that faulty line design can cripple an org's income and overload its posts and excellent line design can double the stat ceiling in any department while lightening the load.

HCO POLICY LETTER OF 16 MARCH 1971
ISSUE III

REMIMEO

PERSONNEL SERIES 19
ORG SERIES 25

LINES AND HATS

It will be found that in organization there are *MANY* major factors involved.

The following three, however, give the most problems:

1. Personnel

2. Hats

3. Lines

Technology is a subdivision of both personnel (who may have to be specially trained before they can be considered personnel) and hats (which are mainly admin technology and line functions).

To solve any problem, one has to recognize what the problem is. One cannot solve problem A by trying to solve problem B or C. Example: Problem: broken-down car. You cannot fix the car by repairing the kitchen lino. Example: You cannot floor the kitchen by fixing the car.

All this may seem obvious when obliviously stated. But there is a more subtle version. ANY PROBLEM THAT DOES NOT SOLVE IS NOT THE PROBLEM. There must be some other problem.

Locating and isolating situations (problems) in an organization is the technique of the Data Series. That technology will find for one the problem that should be solved.

As there are three major organizational factors these then also form the core of all organizational situations (or problems, same thing).

Each one of these is its own zone — personnel, hats, lines.

Each one has its own problems. There are situations in personnel. There are situations in hats. There are situations in lines.

They *are* related. They are not identical.

You will find you cannot wholly solve a problem in lines by solving personnel. You cannot wholly solve a problem in hats by solving lines. You cannot wholly solve a problem in personnel by solving the other two.

Example: Production hours are down. Fifteen new personnel are added to the area. Production stays down. It was a problem in lines.

Example: Confusion reigns in the pipe shop. The lines are carefully straightened out. Confusion still reigns. It was a problem in hats.

Example: Broken products are wrecking org repute. Hats are carefully put on. Products continue to be broken. It was a problem in personnel.

Example: The org stays small. Executives work harder. The org stays small. It was a series of problems in personnel, hats *and* lines, none addressed at all.

You will see symptoms of all this in various guises. The test of whether or not the right problem was found is whether or not production increased in volume, quality and viability.

In actual practice one works on all three of these factors constantly — personnel, hats and lines — when one is organizing.

You will find with some astonishment that failure to have or know or wear or do a *hat* is the commonest reason why *lines* do not go in. That personnel is hard to procure and train because hats and lines are being knocked out. That hats can't be worn because lines or personnel are out.

Situations get worsened by solving the wrong problem instead of the real problem. In the Data Series this is called finding the right *Why*.

Organizational problems center around these three things in the broadest general sense. More than one can be present in any situation.

Production problems are concerned with the particles which flow on the lines, changed by the hatted personnel, with consumption and general viability. So to make a full flow from organization through to distribution, one would add raw materials, changed state of materials and their consumption. Organization is not an end-all. To have value it must result in production.

But when personnel, hats and lines are not solved, production is very difficult. Therefore to get production one must have an organization to back it up. And personnel, hats and lines must exist and be functional. If these exist, the rest of the factors of establishment can be brought into being.

It goes without saying that organization involves other problems like space, materiel, finance, etc. These and many more also enter into "Whys" of no production. But dominating others are problems in personnel, hats and lines. Others tend to solve if these are handled and organized.

HCO POLICY LETTER OF 25 MARCH 1971

REMIMEO

ORG SERIES 26

VALUABLE FINAL PRODUCTS

By definition, a valuable final product is something that can be exchanged with other activities in return for support. The support usually adds up to food, clothing, shelter, money, tolerance and cooperation (goodwill).

On an individual basis this is easy to grasp. The individual produces a product or products which, flowed into the dept, div, org, company, community, state, nation or planet, then returns to him his pay and goodwill or at least sufficient goodwill to prevent his abandonment or destruction.

Long-range survival of the individual is attained in this fashion.

A valuable final product (VFP) is valuable because it is potentially or factually exchangeable.

The key word in this sense is EXCHANGEABLE. And exchangeability means outside, with something outside the person or activity.

A valuable final product could as easily be named a VALUABLE EXCHANGEABLE PRODUCT.

Sanity and insanity are matters of *motive,* not rationality or competence. The sane are constructive, the insane are destructive.

Thus insanity on the part of the potential receiver of a VFP can prevent an exchange of a final product the receiver should be able to use and for which he should be willing to give active support and goodwill to the producer. Example: Man starving; you try to sell him good food at reasonable price for which he has money to pay. He tries to shoot you and destroy the food. This is insanity since he is trying to destroy the product he needs and can afford.

Crime is the action of the insane or the action of attempting seizure of product without support. Example: Robbers who do not support a community seek to rob from it supporting funds.

Fraud is the attempt to obtain support without furnishing a product.

Sanity and honesty then consist of producing a valuable final product for which one is then recompensed by support and goodwill, or in reverse flow, supporting and giving goodwill to the producer of the product.

Ethical basics, morale, social subjects, law, all are based on this principle of the valuable final product. Previously it has been "instinctive" or "common sense." It has not before been stated.

Civilizations which facilitate production and interchange and inhibit crime and fraud are then successful. Those that do not, perish.

Persons who wish to destroy civilizations promote departures from these basic rules of the game. Methods of corrupting fair interchange are numerous.

The FACTORS are the first appearance of these principles.

The theory of the valuable final product is an extension of the FACTORS.

Parts of organizations or organizations, towns, states and countries all follow the principles which apply to the individual.

The survival or value of any section, department, division or org is whether or not it follows these principles of interchange.

The survival or value of any town, state or country follows these principles of interchange.

You can predict the survival of any activity by confirming its interchange regularities or can predict its downfall by irregularities in this interchange.

Therefore it is vital that a person or a section, department, division or part of an org or an org figure out exactly what it is interchanging. It is producing something that is valuable to the activity or activities with which it is in communication and for that it is obtaining support.

If it is actually producing valuable final products then it is entitled to support.

If on the other hand it is only organizing or hoping or PRing and is not producing an interchangeable commodity or commodities in VOLUME or QUALITY for which support can be elicited and even demanded, it will not be VIABLE.

It doesn't matter how many orders are issued or how well org boards are drawn or beautiful the plans to produce are made. The hard fact of production remains the dominant fact.

How well organized things are *increases* production volume and *improves* quality and thus can bring about viability.

But it is the valuable final product there and being interchanged that determines basic survival.

Lack of viability can always be traced to the volume and quality of an actual valuable final product.

Hope of a product has a short-term value that permits an activity to be built. But when the hope does not materialize, then any hoped-for viability also collapses.

One then must organize *back* from the actually produced product.

For instance, a technical subject is capable of producing an exact result.

IF persons are trained to actually produce the result AND THE RESULT IS PRODUCED then one can exchange the technicians with the community for support.

If the result is produced (by training the technicians well) then the result can be interchanged with an individual for support and goodwill.

Where any of these factors suffer in volume or quality then an interchange is difficult and viability becomes uncertain.

As individuals, communities and states are not necessarily sane, upsets can occur in the interchange even when production is occurring.

Therefore the producer has a stake in maintaining the sanity of the scene in which he is operating, and one of his valuable final products is a scene in which production and interchange can occur.

The basics of valuable final products are true for any industrial or political or economic system.

Many systems attempt to avoid these basics and the end result would be disaster.

The individual, section, department, division, org or country that is not producing something valuable enough to interchange will not be supported for long. It is as simple as that.

ORG SERIES 27

HCO ESTABLISHMENT FUNCTIONS

HCO means HUBBARD COMMUNICATIONS OFFICE.

The elementary and very simple actions of HCO are contained in this:

It is really hCo.

C = Communications.

To have Communications you have to have TERMINALS.

Flows can ONLY occur when terminals are rock steady and STABLE. There can be NO flows and NO power without steady terminals. Hence, comm cannot occur without stable terminals.

The ORG BOARD is the pattern of the terminals and their flows. So you have to have an org bd. And the org bd must in truth be a representation of what is in the org.

The org bd shows where what terminals are located in the org so flows can occur.

HCO has recruitment which means it gets people from OUTSIDE the org to be placed as terminals in the org = posts.

HCO has the posting of the org bd and designating the spaces in the org so that flows can occur.

Hatting is a prime function of HCO because otherwise the terminals won't know what they are supposed to be doing or what flows they handle or how.

HCO has INSPECTION to see that the flows are going right and that terminals are functioning.

Ethics exists to handle gross outnesses in flows.

Then routing can occur.

Then production can occur.

In essence that is ALL there is to an HCO.

If it realizes its key is C for Communications and that comm requires terminals and an org bd so that flows can occur then HCO will function.

This action of putting in terminals is called ESTABLISHING.

Thus HCO is the establishing division.

DIS–ESTABLISHING

If HCO does not know this and if it makes numerous errors or alters importances away from this, it DIS–ESTABLISHES the org.

DIS = Take apart.

ESTABLISH = Put there.

DISESTABLISH = Take apart what is put there.

Thus dis-establish means to take out terminals and tear things up.

In using the org itself as a source of personnel, then an "HCO" tears things up far faster than it puts things there.

HAS

The HCO Area Secretary, HAS, has the function of ESTABLISHING THE ORG.

That means to find, hat, train, apprentice persons from OUTSIDE the org, to locate them in the org and on the org bd and then route the raw materials (public people in this case) along the line for production, which means changing particles into a final product.

If HCO *establishes* the org then all will be well.

If it fails to recruit or hat or org bd or route or distribute comm or police the lines, the org will stagger or fail.

The HAS is responsible for seeing that HCO establishes the org.

An HAS who is doing anything else is DIS–ESTABLISHING.

HCO EXTERNAL

HCO has the incoming and outgoing flow lines as well.

This gives it Address. This means the *location* of the terminals OUTSIDE the org that the org contacts.

This in itself is an org bd.

The HAS must insist that the outside terminals are also established.

This gives an international network of flows amongst terminals.

WHAT is produced and WHAT flows on the lines is the business of other terminals outside HCO unless these threaten the functions of HCO.

Now if you think there is anything more to it than this, work and work and work to do it in clay, clean up the misunderstood words and become thus able to envision and handle it.

Many policies exist about HCO. There is a lot of admin tech connected with an HCO but ALL OF IT is entirely and completely concerned with *how* to establish an HCO and an org.

This PL should be known, known, known and any further confusion would be plainly the result of personal aberration such as an inability to conceive of a terminal or a space or a thirst for confusion only found in very batty places.

The functions of an HCO and the duties of an HAS are so elementary and so plain that they cannot be misunderstood even by experts.

HCO establishes the org.

That is the basic thing to know.

The techniques of how it is done are well recorded and broadly issued.

HCO does NOT disestablish the org.

HCO does NOT leave an org un-established.

HCO ESTABLISHES THE ORG.

HCO POLICY LETTER OF 8 MARCH 1971R
ISSUE II
REVISED 22 APRIL 1982

REMIMEO

ORG SERIES 27-1

ORG OFFICER

(Originally written by LRH for the *Apollo* OODs
of 8 Mar. 71. Issued as an HCO PL on 27 Sept. 80.)

Org officers think they approach HASes to organize. They don't.

HCO has not formed because org officers keep making demands on it instead of doing their job. The organization it takes to get out a specific product is instant stuff. HCO is a long-term build of the establishment. Entering instant organization into HCO of course defeats its purposes and prevents it from the long-haul actions necessary to form a whole org.

If an org officer considered himself the product officer's expeditor he would begin to get the idea.

We have a product officer–org officer mission going in to expedite FEBCs. The product officer will get the product — a competent graduated FEBC on an airplane going home — being made and fired. The org officer will push the materiel and lines into shape to back up the product officer. Now, what's *that* have to do with HCO? Nothing.

The org officer makes sure there *is* a pack or tape or recorder or gets them (not by despatch) and the product officer checks out, verifies, grooms, solves FEBC problems, pushes cases.

The Course Super goes on supervising, Course Admin goes on admining. What they're doing right with the student gets pushed and done more of. And what organization there is gets more of from the org officer.

For instance, here is a CO-type prod officer action that was done.

SITUATION: Course numbers building up. You see this in orgs.

HANDLING: Put on a prod–org mission to get numbers completed and fired.

The CO found three who could be made ready to fire at first glance and gave the order GO-GO-GO, to Action.

The cope was fire three, NOW. The medium range was get a mission on it.

That is uptight production.

A prod–org team works in *hours* and *days*. Save an hour, save a day. Do it in hours, do it in days.

By doing it they learn line and materiel outnesses and their reform CSWs of lines and actions are written up when they're completed and that's their first contact with the HAS and HCO.

Now with these reforms the general org action will be easier and faster and a product backlog peak won't occur so fast again.

A prod–org team that writes despatches and harasses HCO just doesn't know THAT THE PROD–ORG SYSTEM IS TO HANDLE BACKLOGS AND OMISSIONS IN PRODUCTS. *Having handled* they can advise or order or get approval for line changes and new recruitment, etc. These, the HAS can get in for the long haul.

Prod–orgs WORK, they don't just order.

ORG SERIES 28

WHY HATTING?

A few days ago when I found that musical chairs and flubbed hatting had unstabilized some areas, I wondered whether or not this might stem from some social aberration that was very general in the societies in which we are working.

And it seems to have been the case. I worked on it a bit and found this:

LAW: THE POWER OF A THETAN STEMS FROM HIS ABILITY TO HOLD A POSITION IN SPACE.

This is quite true. In *Scientology 8-80* the base of the motor is discussed. It holds two terminals in fixed positions. Because they are so fixed, power can be generated.

If a thetan can hold a position or location in space he can generate POWER.

If he cannot, he cannot generate power and will be weak.

We have known this for nineteen years. It applies here.

Observation: MODERN SOCIETY TENDS TO CONFUSE AND UNSTABILIZE PERSONS WITH ITS HECTIC PACE.

Observation: BEINGS WHO ARE AFRAID OF STRONG PEOPLE TRY TO WEAKEN THEM.

Observation: PERSONS WHO ARE PUSHED AROUND FEEL THEY CANNOT HOLD A POSITION IN SPACE.

Observation: PEOPLE HATE TO LOSE THEIR POSTS AND JOBS. THEY FIND IT DEGRADING.

In processing, picking up this chain of lost positions achieves very good gains and rehabilitates a person's ability to hold a job.

LAW: BY GIVING A PERSON A POST OR POSITION, HE IS SOMEWHAT STRENGTHENED AND MADE MORE CONFIDENT IN LIFE.

LAW: BY LETTING A PERSON RETAIN HIS POST, HE IS MADE MORE SECURE.

LAW: BY HATTING A PERSON, HE IS GREATLY STRENGTHENED AS HE IS HELPED TO HOLD HIS POST.

A basically insecure person who feels he is unable to hold his position in space is sufficiently strengthened by hatting to feel secure enough to do his job.

LAW: HAVING A HAT, BEING HATTED AND DEMONSTRATING COMPETENCE MAKES A PERSON FEEL CAPABLE OF HOLDING HIS POSITION IN SPACE AND HE BECOMES MORE STABLE, CONFIDENT IN LIFE AND MORE POWERFUL.

LAW: UNHATTED PERSONS ON A POST CAN BECOME CRIMINAL ON THE POST BECAUSE THEY FEEL INSECURE AND BECOME WEAK.

When a person is secretly afraid of others, he instinctively will not hat them or hats them wrongly and tends to transfer or move them about.

When a person is insecurely posted and insufficiently hatted, he can try to weaken others by trying to prevent their hatting and trying to get them transferred or even dismissed.

This is apparently the social aberration at work.

The answer to a sane org and a sane society is not welfare and removal. It is:

Recruit them,

Train them,

Hat them,

Apprentice them,

Give them a post.

This is so strong in truth it would de-aberrate the bulk of the crime out of a society.

And it sure will put an org in POWER.

INFINITE EXPANSION

There is no reason whatever to ever contract or reduce the size of an org except covert destruction.

In theory there is no limit to the size of an org.

The 1967 org board is capable of expanding to 200,000 staff members!

For our purposes, there is no real limit to expansion.

So long as property purchase does not commit future income dangerously and so long as HASes keep the admin staff in a ratio of two to one technical staff, there is no limit to expansion.

So long as cash-bills is kept more cash than bills there is no limit to expansion.

So long as the staff produces what their posts call for there is no limit to expansion.

So long as you DELIVER in quality what you SELL there is no limit to expansion.

So long as you keep standard on admin and keep standard on tech, there is no limit to expansion.

So don't get frightened, don't fire people, don't cut back. Understand the above and the *whole* of this policy letter. And there is no limit to expansion.

So EXPAND.

ORG SERIES 29-1

ORGANIZATION AND SURVIVAL

(Originally written by LRH for the *Apollo* OODs
of 10 Nov. 71. Issued as an HCO PL on 11 Sept. 80.)

Well-organized activities survive. The survival of individuals in those organizations depends on the highly organized condition of the activity.

A small group, extremely well organized, has excellent chances of survival.

Even a large group, badly organized, hasn't a prayer.

The essence of organization is org boarding, posting with reality and, in keeping with the duties being performed, training and hatting.

To this has to be added the actual performance of the duties so that the activity is productive.

The outward signs of a badly organized group are slovenliness and fumbles.

Another ingredient that goes hand in hand with organization and survival is toughness. The ability to stand up to and confront and handle whatever comes the way of the organization depends utterly on the ability of the individuals of the organization to stand up to, confront and handle what comes the individual's way. The composite whole of this ability makes a tough organization.

An individual who is not properly posted, isn't performing the duties of the post, is not trained or hatted is soft. He has no position to hold, therefore he goes down at the first fan of a feather.

Confidence in one's teammates is another factor in organization survival. Confidence in one's self is something that has to be earned. It is respect. This is a compound of demonstrated competence, being on post and being dependable.

After an individual has failed, confidence in him on the part of his teammates sinks. He has lost face and is not respected. This, then, shows itself up in numerous ways. It is up to that individual to earn back confidence so that his teammates will again trust him. The way to do this is to get properly org boarded, trained, hatted and to confront and handle, with competence, whatever that post is supposed to control.

INDEX

The ultimate in no confidence by a group in a team member is no post at all. Reports from those who have no post or from those who are between posts stress the horrors of having no post.

Our survival depends fully on becoming entirely and completely organized. This will happen to the degree that every separate unit, department and division in an org is properly org boarded, properly performing the duties of the post, is trained and fully hatted.

ESTABLISHMENT OFFICER SERIES 22

ESTO FAILURES

For several months I have been studying the Esto system in operation and have finally isolated the exact points of any failures so they can be turned to successes.

PUTTING IN THE SYSTEM

An Esto returning to an org can crash it.

The exact reasons for this are:

A. The execs who heretofore did organizational work say, "Ah, here's the Esto system at last," and promptly drop their organizational and personnel actions.

Yet here is this lone E Esto, no divisional Estos, no one trained to support him.

The right answer is when an E Esto goes into an org where there are no Estos or only a TEO or QEO, he must gather up the execs and tell them it will take him weeks to recruit and train Estos and that THEY MUST CONTINUE ANY ORGANIZATIONAL ACTIONS THEY ARE DOING and that the HAS IS STILL ESTABLISHING THE ORG.

Otherwise they let go their lines.

B. The new E Esto takes key production personnel from the divisions to be Estos and they crash.

The answer to this is to RECRUIT the new Estos.

This is easier than it looks if you recruit idle area *auditors* to be Estos.

If you do this, remember that they went idle as auditors because they had out-ethics, were PTS, had misunderstoods and out-TR 0. To get them you do a 3 May 72 (ETHICS AND EXECUTIVES) PL, a 5 Apr. 72 (PTS TYPE A HANDLING) PL, Method 4 on their courses and make them do *real* TRs, especially zero. And they'll be ready.

You get a list of area auditors and contact them and do the above on them and you'll have Estos who are half-trained already.

Failing this or in addition to it just plain recruit.

C. The first post a new E Esto should take is Dept 1.

He does NOT "hat the HAS" or "just do programs." He rolls up his sleeves and WORKS as director of Dept 1.

He recruits, he posts up Dept 1. He hats the hell out of Dept 1.

He makes a Department 1 that really, really flows in personnel, puts up org boards and hats.

WHEN he has a Department 1 FUNCTIONING he can begin to recruit Estos as well as other org staff.

If he can't get a Dept 1 whizzing he has no business being an Esto, does he?

He does NOT put in Dept 2 or act as Dept 3. He makes the HAS handle these.

With a *strong working* Dept 1, an Esto system can then go in.

D. Musical chairs is the commonest reason any org collapses.

A "new broom sweeps clean" complex will wreck any org.

An E Esto on arrival, taking over Dept 1, FREEZES ALL PERSONNEL TRANSFERS. He does not permit even one transfer.

The only exception would be where a musical chair insanity has just occurred. If this was followed by a stat crash then one REVERTS THE ORG TO THE UPSTAT PERIOD and *then* FREEZES PERSONNEL TRANSFERS.

But before one reverts one must evaluate the earlier period by stats to be sure it WAS the upstat period.

By freezing personnel one protects what he is building.

Almost all musical chairing is the work of a suppressive except when it is the work of an idiot.

E. Anyone trying to hold Dept 1 in a personnel starved org is holding a hot seat as any HAS or Personnel Director can tell you.

Body traffic to this dept in any medium-sized org defies belief.

It looks like Grand Central Station at the rush hour.

"I have to have _____," "Where is my Course Super _____?" etc., etc., etc., is the constant chant.

You can spend the whole day interviewing staff execs and get nothing done.

There is a right way to do all these things and a billion wrong ways.

Obviously the answer to all their problems is to get and train new people. Yet how can one in all the commotion.

Ninety percent of these requests are from people who are not hatting and using the people they already have.

The right way is on any new personnel demanded one gets Dept 3 to do an Inspection and Report Form for people in the area of the exec doing the demanding. You will find very often unhatted, untrained and wasted personnel and many outnesses.

You hold the line on personnel by saying: "Handle these unutilized or half-working staff or these outnesses. You are here on my procurement board as entitled to the (give priority, 3rd, 8th) person we hire or recruit."

And get industrious in recruiting, using all standard actions, for that is the only way things can be solved.

Most orgs would run better on less people because the personnel are not hatted or trained. One org, two years before this writing, made *four* times as much money on *half* the personnel it now has.

Unhatted, the staff is slow and uncertain. Unproducing, the div heads demand little.

But they sure can scream for more personnel!

No org ever believes it is overmanned.

F. Some divisions (like the usual Treasury or Dissem) can be undermanned. Key income posts most often are empty.

When one mans up an org one sets priorities of who gets personnel.

This is done by PRODUCTION paralleling. One mans up against production.

New people come in through Div 6. They are signed up by Div 2. Delivery is done by Div 4. Money is collected by Div 3. That gives you a sequence of manning up.

You man income and delivery posts with new hirings.

The E Esto is trying to get in a Dept 1 so of course he gives this a priority as well.

Until the income is really rolling in and the delivery rolling out, one does very little about other areas.

Having gained VOLUME, one now begins to man up for quality. This means a Cramming and a W/C Section in Qual. It means more HCO.

One now hits for future quantity by getting auditors in training, more upper execs in training.

When the org is so built and running and viable it is time the whole Esto system got manned up.

G. Every 5th person hired on an average should be put in Dept 1 as a *Dept 1* extra personnel who does Dept 1 duties and trains part time as an Esto.

This gives the E Esto additional personnel in Dept 1.

It also begins an Esto right.

His most essential duties as an Esto *are* Dept 1 type duties.

You eventually have a bulging Dept 1. You have a basic Dept 1 that functions well and will continue so. You have the Esto trainees who are working in Dept 1 as Dept 1 personnel. And you have of course some new people who are HCO Expeditors until they get in enough basics for real regular posting.

This makes a fat Dept 1 and proves one can Esto!

SUCCESS

If an E Esto introduces the Esto system exactly as above and in no other way, he will be a success.

Like an auditor varying processes or altering HCOBs, a new E Esto who varies the above will bring about disaster.

Where E Estos have gone into orgs other ways or where the system has been varied, stats have crashed.

By going in this way, as above, it can be a wild success.

How fast can you put in an Esto system? It takes months of hard work. It depends really on how good the E Esto is at recruiting, org boarding and hatting.

If he's good at these things the time does not stretch out to forever.

For comparison, it took half a year each to build DC, Johannesburg and SH to their highest peaks. They were all built from a Dept 1 viewpoint of recruiting, org boarding and hatting hard enough to get production.

So this is the oldest pattern we have — Dept 1 evolves the org.

When the org gets too big Dept 1 loses touch. You extend it into each div and you have the Esto system. And you have Estos.

HCO POLICY LETTER OF 23 JULY 1972RB
REVISED 11 JANUARY 1991

REMIMEO

EXECUTIVE SERIES 15
PERSONNEL SERIES 26
ORG SERIES 31
ESTABLISHMENT OFFICER SERIES 23

THE VITAL NECESSITY OF HATTING

On a graph analysis of past stats, my campaign on hatting where a hat was a checksheet and pack apparently introduced a steady rise of the International Gross Income.

Studying this further I discovered a new basic, simple fact:

HATTING = CONTROL

A person who is hatted can control his post.

If he can control his post he can hold his position in space — in short, his location. And this is power.

When a person is uncertain, he cannot control his post, he cannot control his position. He feels weak. He goes slow.

If he can control his post and its actions he feels confident. He can work effectively and rapidly.

The key is CONTROL.

Control is the ability to START, CHANGE and STOP.

When he is hatted he knows the tech of HANDLING things. Thus he can control them. He is at CAUSE over his area.

If you have an org composed only of weak wobbly posts, they tend to collapse in on each other. There is no POWER.

The org then cannot be CAUSE over its environment because it is composed of parts which are not cause. The whole is only the sum of its parts.

If all the parts are each one at cause, then the whole will be at CAUSE over its environment.

Only an org at CAUSE can reach and CONTROL.

Thus a fully hatted org can be at cause over its environment, can reach and control its fates and fortunes.

THUS THE PRIMARY TARGETS OF AN ESTO ARE:

A. ESTABLISHED ORG FORM and

B. FULLY HATTED PERSONNEL.

BASIC SEQUENCE OF HATTING

1. Recruited or hired. Signs contract.
2. Instant-hatted for the job assigned as an HCO Expeditor.
3. Staff Status 0.
4. Basic Study Manual (if the staff member has not previously done the Student Hat or Primary Rundown).
5. Staff Status I.
6. Staff Status II.
7. Posting as other than an HCO Expeditor.
8. Full hatting with a checksheet and pack fully done with M6, M7, M9, M3 and M4 Word Clearing.
9. Eligibility for study and auditing (OR for staff service or study).
10. Must have a stat and demonstrated he has produced on post.
11. Purification Rundown.
12. Objective Processes: CCHs, 8-C, SCS, Havingness, etc.
13. Scientology Drug Rundown (if required).
14. Method One Word Clearing, Student Hat.
15. Administrative or tech training (OEC or auditing).

Flag Orders in the Sea Org may change this lineup slightly but it is basically the same.

No one should have any other training, much less full-time training, before step 12 in the above.

After a staff member has completed Staff Status 0 he may receive PTS handlings and study the PTS checksheet and may have emergency assists. He may also be audited by students and TTC if he has rising stats.

There are time limits placed on how long it takes to do SS I and SS II. A person who can't make it is routed to Qual where he is offloaded with advice on how to get more employable. (In the SO it is Fitness Board.)

TIME–TESTED

The above is the route that has been tested by time and found good.

Other approaches have NOT worked.

Granting full-time training at once is folly. The person may get trained but he'll never be a staff member. This is the biggest failure with auditors — they don't know the org. Admin training with no org experience to relate it to is a waste of time.

This was how we built every great org. And when it dropped out the org became far less powerful.

Old-timers talk of these great orgs in their great days. And they will tell you all about the org boarding and hatting that went on. How the Hatting Officer in HCO and the Staff Training Officer in Qual worked as a team. And how fast the lines flew.

The above steps have stood the test of time and are proven by stats.

RECRUITING AND HIRING

You *never* recruit with a promise of free courses or free auditing. Not even HASes or HQSes. You recruit or hire somebody to be part of the team.

OPEN GATE

If *any* opinion or selection is permitted as to who is going to be let on staff, *all* recruitment and hiring will fail.

By actual stats when you let *anyone* say, "No! Not him! Not her!" the gate shuts, the flow stops. And you've had it.

Requirements and eligibility *fail*. The proof is that when they have existed in orgs, the org wound up with only PTSes and no-case-gains!

The right answer is FAST FLOW hiring. Then you have so many that those who can't make it drift low on the org board or off. You aren't trying to hold posts with unqualified people "who can't be spared."

In a short-staffed org "looking only for the best people" the guy nobody will have gets put in an empty "unimportant" department. He's now a Director!

It only happened because you didn't have dozens.

The answer is NOT lock the gate or have requirements. The answer is HAT.

An org that isn't hatted goes weak and criminal.

Don't be selective in hiring or recruiting. Open the gates and *HAT!*

Follow the steps given above and you have it.

Don't spend coins like training or auditing (or travel) on people until they have proven their worth. No bonuses or high pay for anyone until they have reached and attained step 10 (a good stat). The cost of such fast flow hiring is not then a big factor.

The only trouble I ever had with this was getting div heads to UTILIZE their staff. A FIRST JOB FOR AN EXECUTIVE IS TO GET THINGS FOR HIS PEOPLE TO DO. AND KEEP THEM BUSY AT PRODUCTIVE THINGS.

So I used to have to go through the org that did FAST FLOW HIRING regularly and get people to use their new people. And to move off those who could not work.

This was ALL the trouble I had with the system.

And until I enforced FAST FLOW HIRING there was always some effort by someone to close the gate.

ALL the great executives in Scientology came up in such orgs.

With a *flow* of people the best move on up. The worst, if any, drop off.

Only orgs with restricted hiring or recruiting give trouble.

IN A FAST FLOW HIRING ORG THE HAS AND ESTOs *MUST* BE ON THE BALL. THE BREAKDOWN OCCURS WHEN THEY DO NOT *HAT* AND KEEP ON TOP OF THE PERSONNEL SCENE.

Fast flow hiring only breaks down and gets protested where HCO and Estos are not doing a top job. They have to really *handle* the personnel, post them, hat them, keep the form of the org.

A fully formed org in a heavily populated location would need hundreds of staff. It would make hundreds of thousands.

But only if it is fast flow hiring, hatting, holding the form of the org, and only then could it produce.

ESTABLISHING
HOLDING THE FORM OF THE ORG

If a person who could not play a piano sat down at a piano and hit random keys, he would not get any harmony. He would get noise.

If the head of a division gave orders to his staff without any regard to their assigned posts or duties, the result would be confusion and noise.

That's why we say a division head "doesn't know how to play the piano" when he knows so little about org form that he continually violates it by giving his various staff members duties that do not match their hats or posts.

But even if one could play the piano, one would have to have a piano to play.

SPECIALISTS

Each org staff member is a specialist in one or more similar functions. These are his specialties.

If he is fully trained to do these he is said to be HATTED.

The combined specialties properly placed and being done add up to the full production of an org.

The org form is then the lines and actions and spaces and flows worked out and controlled by specialists in each individual function.

These specialists are grouped in departments which have certain actions in common.

The departments having similar functions are grouped into divisions.

The divisions combine into the whole org form.

It is *far* less complex than it looks. It would be very complicated and confusing if there weren't divisions and departments and specialized actions. Without these you would get noise and very limited production and income, and at great strain.

Take a theater as an example. There are people who advertise it; these are the public relations people; they are hatted to get publicity and make people want to come to the play; call them the PR Division. There are the producers and directors; they are hatted to present a performance and make it occur; call them the Production Division. There are the actors and musicians; call them the Artists Division. There are the property men; they are hatted to get costumes and items needed; call them the Property Division. There are the stagehands and electricians and curtain and set men; call them the Stage Division. There are the ticket sellers and money handlers and payroll and bills payers; they are hatted on money and selling; call them the Finance Division. There are the people who clean the theater and show people to seats and handle the crowds; call them the House Division. And there are the managers and playwrights and score writers and angels (financiers); call them loosely the Executive Division.

Now as long as they know their org board, have their flows plotted out, are hatted for their jobs and do a good job, even a half-good play can be viable.

But throw away the org board, skip the flows, don't hat them and even a brilliant script and marvelous music will play to an empty house and go broke.

Why? Because an org form is not held. Possibly an untrained unhatted producer will try to make the stagehands sell tickets, the actors write the music, the financiers show people to their seats. If he didn't know who the people were or what their hats were he might do just that.

And there would be noise and confusion even where there was no protest. People would get in one another's road. And the general presentation would look so ragged to the public they'd stay away in droves.

ESTO ACTION

Now what would an Esto (or an Executive Director) have to do with, let us say, an amateur, dilettante theatrical company that was about to bog.

Probably half the people had quit already. And even if there were people in the company they would probably need more.

The very first action would be to Esto Series 16 the top men to make money quick.

The first organizing action would be to kick open the hiring door. This would begin with getting out hiring PR and putting someone there to sign people up who came to be hired (not to test and audition and look at references, but just to sign people up).

The next action would be to do a flow plan of public bodies and money. So one sees where the org form reaches. Then a schedule.

Next action would be to do an org board. Not a 3-week job. (It takes me a couple hours to sketch one with a sign pen for posting.) AND GET IT POSTED.

One then takes the *head* of each of these divisions and *hats* him on what his division is supposed to do and tell him to *do* it. NOW.

You make and post the flow plan, org bd and terminal locations plan where the whole company can see them.

Chinese drill on a flow plan to show them what they're doing and what has to be done.

Chinese drill on the org board including introducing each person named on it and getting it drilled, what he does and who he is.

You Chinese drill the terminal locations where each of these persons (and functions) is to be found.

You get agreement on schedules.

You now have a group that knows who specializes in what and what's expected of each.

You get the head of the whole company to work with and hat the heads of his divisions.

Now you get the heads of divisions to hat their own staffs while you help.

And you get them busy.

You then put the polishing touches on your own Dept 1 (personnel PR, personnel hiring, personnel placement, org bds, hat compilations, hat library and hatting, hatting, hatting).

And by hatting and insisting on each doing his specialized job and getting seniors to HOLD THE FORM OF THE ORG by ordering the right orders to the right specialists and targeting their production and MAGIC! This amateur theatrical company gets solvent and good enough to wind up on Broadway. It's gone professional!

You say, yes, but what about artistic quality? What about the tech of writing music and acting . . .

Hey, you overlooked the first action. You kicked the door open on hiring and you hatted and trained. And you let go those who couldn't get a stat.

Eventually you would meet human reaction and emotion and would put in a full HCO and a full Qual particularly Cramming. But you'd still do that just to be sure it kept going.

Yessir, it can't help but become a professional group IF you, the Esto, established and made them HOLD THE FORM OF THE ORG and produce while they did it.

An Executive Director can do all this and produce too. The great ones do things like this. But here it is in full view.

A Scientology org goes together just like that. Which could be why, when we want to get something started, we say:

"Get the show on the road!"

But there is no show until it is established and the FORM OF THE ORG is held.

You are luckier than the amateur theatrical company's Esto. You have policy for every post and a book of it for every division and all the tech besides.

So there is no valid reason under the sun you cannot establish and then hold the form of the org.

ORG SERIES 33

PRODUCTION BUGS

An analysis of failures to produce in several fields showed this fault:

EXPERIMENTING ON A
STANDARD PRODUCTION LINE.

Example: A cook can cook 30 dishes of various types successfully. Instead of retaining these as they are and seeking on the side to create or find new dishes, the cook experiments with and changes her 30 standard dishes. The result is failed production.

Example: A musical group has 15 finished pieces of repertoire. Instead of developing totally new pieces, they rewrite their existing repertoire. The result is a failure to do good shows.

Example: An org is doing well with a standard CF letter writing campaign. This personnel is pulled off onto phones only as an experiment. The org stats crash. The correct action would be a pilot phone program using new personnel and leaving the standard actions in.

In all cases the right thing to do is maintain without variation the standard production line and if experimenting or change is to be done: pilot it on the side with people or actions that do NOT impede standard production.

There is always a better model in the research lab than there is on the production line. The only bug occurs when the incomplete and unknown model is shoved over *as* the standard production.

If on test and experience a new action, properly piloted, is better, then and only then is it *added* to the standard line.

ORG SERIES 34

WORKING INSTALLATIONS

Never unmock (take down or destroy) working installations.

A working installation is something that is operational.

The most flagrant violation of this is tearing up Div A to create Div B.

Division A is working. Somebody orders Division B to be strengthened.

A stupid or suppressive personnel person will tear up Div A to get personnel for Div B.

The correct action is to find extra or new people for the new action.

MUSICAL CHAIRS (transfers of persons around an org) is THE SINGLE MOST DESTRUCTIVE ACTION TO AN ORG'S STATS.

A failure to recruit and train new people leads one toward the destruction of working installations.

Whenever a new unit has to be made up, the failure to recruit and train shows up vividly. Essential people are ripped off their posts to form the new unit and the destruction of working installations by this action shows up at once in production stats.

It takes a great deal of work to find, hat and post people and get them experienced enough to produce. It takes a lot of work to make a working installation. But in one swoop some irresponsible personnel transfer can destroy it.

In mechanical matters the same thing applies. It takes a lot of work to make something operational. If for a while it is not used, a mechanic may rob its parts to set up something else instead of getting new parts for the something else. Then when the working installation is needed, it doesn't function and a great deal of trouble and expense is put in setting it up again. The trouble and expense is far more costly than getting the parts elsewhere.

NEVER UNMOCK A WORKING INSTALLATION.

It will be far more costly than going to a lot of trouble and expense to get the people or parts elsewhere.

THE STAT PUSH

WHAT exactly is a stat push?

The danger in talking about this subject at all is that someone can do an immediate make-wrong by saying, "This means don't try to raise any stats."

So to understand this subject at all, one must have a pretty clear idea of exactly what is meant by "Don't push stats."

First of all one has to know precisely that STATISTICS ARE AN INDICATOR, THEY ARE NOT AN OBJECT.

WHEN YOU PUSH THE INDICATOR YOU DO NOT OBTAIN THE OBJECT IT REPRESENTS.

PRODUCTION IS COMPLETED CYCLES OF ACTION, NOT JUST NUMBERS.

The figure "1" in "1 apple" is not the apple.

Therefore pure, raw, naked stat pushing is an outpoint called "wrong target."

Pushing a stat without doing anything to bring about the stat is therefore an aberration.

Demanding a stat without doing anything to see that it occurs or putting anything there to make it or correcting anything that is preventing it is an aberration built out of either psychosis or ignorance of what should really be done.

It is quite true that stats must be kept up. But unless they are kept up by putting something there or correcting something that is there and getting all the cycles of actions done by all those who should do them, the stats will DECREASE and eventually vanish.

An order, a telex, a yell to the effect "GET THE STATS UP" is so much wasted time.

Further, such an order or telex or yell in any form has a very deteriorating effect. Individuals or staffs look at it in a properly weird light. They are there, they are doing what they can, they have problems and tangles and barriers. And telling them to "Get the stats up" causes various reactions, none of them very good. Essentially, it gives

them neither help nor direction and even subtly informs them that the person ordering either does not know or does not care what is going on and is not about to help. The eventual reaction can become an ignoring of that command channel.

There are some specialized actions in stat pushing. Chief amongst them is the "GI push."

The usual indicator of this is a neglect or abandonment of staff or caring about staff. One sees no real effective attention on recruitment, training, apprenticing, hatting, future execs. And when one sees this it usually follows that there is a "GI push" going on somewhere in the executive strata. Why this indicator? Well, you see, it only takes a small handful of people to get in GI, and where executive attention is fixated on a "GI push," the various production staff, HCO and the rest of the org aren't "necessary." You find this with EDs who reg instead of getting Registrars and putting an org there, with EDs who go for credit unions and odd financial deals. And you will also find they have the biggest number and amount of refunds and the biggest backlogs AND a shrinking and unhappy org. Unfortunately, they soon also get a crashing GI, for none of the support actions are being done across the divisions.

The reason "GI pushing" happens so often is the structure of the society itself. The only real crime for which one can be punished by the governments of today is lack of money. In other crimes if one has the huge sums necessary to hire lawyers, one can often get off. But the crime of having no money is the only crime one cannot get out of. There are even laws which cause the arrest on the street of persons who do not have so much money in their pockets or wallets: it is called "vagrancy." So with the whole aberrated society on a big "GI push," with Wall Street measuring values only in how much something costs, with wages and prices soaring, at this writing, to total social disaster, it is no wonder that shortsighted and untrained or even aberrated executives get into a "GI push."

The answer to not having money is, of course, to make more money. And there is nothing whatever wrong with that. BUT that is *not* done with a "GI push." It is done with putting a whole org there, every part of it functioning and delivering, with all the bugs out of its lines, *and* making a lot, lot, lot more money. Fifty trained staff producing everything an org is supposed to produce will make far more money than five guys concentrating on GI only and letting the rest of the org go to blazes. The GI made by the fifty will go on increasing. The GI made by the five (and not backed up by the rest of the org) will decrease week by week and then crash.

Let us take some examples of "stat pushing":

The room is cold and the staff is wearing overcoats and using blankets. Mr. Stat Pusher walks over to the thermometer on the wall and sees that it reads very low. So he yells at the thermometer, "Get the stat up!" Nothing happens of course, it still says 15 degrees, so he yells at the staff, "Get that stat up!" Now, in this instance, having a stat pusher around, the org has no Treasury Div and so there was nobody to pay the bills and the fuel company has refused to deliver further fuel. The janitor is missing because there is no HCO to hire one or keep one on post so there's no one to light the furnace even if it had fuel. And due to an unhatted Financial Planning Committee, that also doesn't meet or exist, no new boiler was ordered when the old one blew up last year. The stat pusher seems incapable of observing these facts, and is too unskilled

to bring them to rights. So he continues to yell "Get the stat up" and the staff wears more and more coats and blankets until at last it is just a quiet scene of solid ice.

If the letters out stat is down, this is a bad INDICATOR. It is vital that one keeps stats and observes when one goes down. It is extremely hard to manage on one's post or in an org unless one has a stat. But, in going down, WHAT is being indicated? A lack of letters out. So what does one do? Does he yell "Get the letters stat up"? Or does he look into this? If he looked into it, he could find the real Why, handle it and the letters stat would go up. He might find that the Letter Reges were all sacked so as to increase the unit pay one week and that he has somehow gotten a nut onto a personnel or finance post (whose R/Ses make even his head jerk back and forth). He might find that the typewriters had broken down. He might find that Dept 5 people were all being used by Div 5 to handle their files. At the very least he will find something aberrated or ignorant going on which has to be handled before the letters can be flooded out again. WHEN this is found and handled, THEN the letters out stat will go up.

So Mr. Stat Pusher is essentially operating on a short circuit. He cannot or will not look.

And there is another variety of stat aberration which comes about after a lot of "Get the stat up" has failed. This is Mr. Stat Ignorer.

Mr. Stat Ignorer is driving along in a car and he looks at the speedometer. It says 15 mph. He glares at the needle for a moment and then handles it. He pastes a piece of paper over it so it can't be seen. And sits back and drives contentedly. If he'd looked, he would have found he had three flat tires and an engine about to run out of oil and explode.

Then there is also Mr. Stat Faker. He knows that he will get in trouble if his STAT is down. So he simply dreams up a figure and puts it on graph paper. He is encouraged and rendered confident in this because he is sure that no senior will come around and notice the towers of unanswered letters or the huge backlogs of cramming orders or the mobbed waiting room of unhandled public or the mountain of uncorrected and unfiled address plates. He is confident because no senior has in the last year or two. And he can say "I'm an upstat" when the Ethics Officer tries to hit him for keeping the front door to the org obstructed with his motorcycle. And he is recognizable by a caved-in case, low morale and a hunted look of glee as he creeps through the org.

There is one common denominator the stat pusher, the stat ignorer and the stat faker have. And that is AN ABSENCE OF SKILLED MANAGEMENT.

We have investigatory tech. It is there for use. We have the Data Series evaluation tech. It is there for use. We have administrative tech. And it is all published and there for use. And further, when it *is* known and used, proven times without number now, production and prosperity occur AND show up as statistics which INDICATE that production and prosperity are occurring.

Yes, it is very, very true that an org or a manager or an auditor or file clerk gets in trouble if their stats are down.

Yes, it is true that stats should exist and be used.

But it is equally true that the way to get a stat is to put something there that can get something done and get the lines debugged and the scene handled.

The fate of the stat pusher, the stat ignorer and the stat faker is to look around one day and find no org.

It's a very long way between yelling or telexing or writing "Get the stat up" and handling things and getting production cycles completed so that the stat WILL go up.

The stat, properly stated and honestly kept, IS a vital indicator of the scene. If you know how to use them you can get the areas that have to be handled. And if you know your policy and tech you can find the real Whys and get real handlings and get things whizzing.

We mean to have all the stats going up because this INDICATES a bettering state of affairs for everyone.

The job of the product officer is NOT to yell "Get the stats up." The product officer is there to notice and order things like "Get those letters answered so they get answers." And the job of the org officer is to carry out the handlings the product officer finds necessary to get production rolling.

A fire-breathing product officer is worth his weight to every staff member IF he is trying to get and is getting production which results in bettered conditions, better products, better prosperity and THIS will incidentally show up in the stats.

It's a world of things that have to be done and coordinated before the stats go up.

We are in the business of people, we are in the business of a bettered world. We have to have completed cycles of action. And these are shown in stats.

We are also in a world of exchange and would be no matter what ideology we lived under. We have to "make GI" and we have to have "the stats up."

But our success is measured in terms of the ACTIONS we do, for only those show up in the indicators called statistics.

So, okay. Let's go about it the right way. And find what is holding the stats down and handle and correct those things and so, honestly and swiftly become upstat.

STAT PUSH CLARIFIED

This policy letter is revised. The second paragraph of the original said that it was dangerous to talk about the subject because somebody could do an immediate make-wrong by saying, "This means don't try to raise any stats."

Well, exactly that happened. There was a heavy campaign run into all Flag Operations Liaison Offices and to orgs designed to discredit asking for raises in stats. (The person who did it and failed to push production quotas is suspended and under Comm Ev.)

The whole point seems to have been missed. It was this: You can't ask for a NUMBER; you CAN and MUST ask for a SOMETHING.

That something is a *product*. It is a thing, a tangible item.

Right this minute, as a result of a mission, HCO PL 16 Nov. 76, Exec Series 19, Org Series 37, PRODUCTION QUOTAS, has now been provided with thoroughly researched subproducts one has to push in order to get the PRODUCTS. These are the real tangible actions you have to take to get a number of actual products. In other words, by getting many exact minor products, you then can achieve the valuable final product.

STATISTICS are those numbers which simply count the products attained or obtained.

Stat management is the only kind of management you can do on a production scene. Management by statistics was brought to a fine art in Scientology admin tech. To discredit it is, of course, to court failure.

Abusing statistical management is also something of a crime. It has been done by some managers who said "Get the stats up" without ever saying what subproducts you had to get that would then make up the product.

Stat management is a valuable tool and has gotten us over the years. To discredit it first by saying first just "Get the stats up" without saying how or what or why was one side of the pendulum. Then the pendulum swung clear to the extreme and people were being made guilty for even watching stats or demanding or working to raise them.

So let's get a little middle swing of the pendulum now.

It is perfectly all right to demand that stats rise so long as one says what subproducts and products make up those stats and gives some indication of what people should do to get the stats rising.

It is perfectly all right to do stat management.

And it is perfectly okay to come down hard on people or orgs who fail to get their stats in viable range.

So long as you give them some idea of what small products (subproducts) they have to get to make up the real products, you are NOT doing a stat push.

So long as you give people some direction and guidance, you can yell for stat increases all you want.

And you better.

MANNING UP AN ORG

THE SEQUENCE OF POSTING DEPTS AND DIVS

You need an org board first and an allocation board.

The sequence in which an org is manned up is roughly:

– Dept 1

– Dept 11

– Reg and Body Routers and Intro people in Div 6

– Dept 12 (enough auditors and C/Ses to approach 2 admin to 1 tech in org)

– Dept 6

– Dept 7

– Dept 3

– SSO and Supers in Qual to train staff

– Dept 5 for CF, Address and Letter Reges

– Dept 4 for promo

– Dept 21 (LRH Comm)

– Dept 10

– Dept 20

– FR and execs

– Full Div 6

– Full Div 1

– Full Div 4

– Full Div 2

– Full Div 5

– Full Div 7

– Full Div 3

(Note, an AO always mans up the AO Dept or Div along with the SH one in each case.)

Wrong sequence of manning is Dept 6, Dept 12, Dept 6, Dept 12, Dept 6, Dept 12, as you wind up with a stuck clinic that won't expand.

Wrong sequence will contract an org while trying to expand it, as the org will go out of balance, bad units, noisy and unproductive.

If manned in a correct sequence, its income has a chance to stay abreast of its new staff additions.

Emphasis on GI without comparable emphasis on delivery and organization can throw an org into such a spin only a genius can run it.

Manned in proper sequence, and hatted as it goes, an org almost runs itself.

Single handing from the top comes from long-standing failures to man or man in sequence, from earlier noncompliance with explicit orders or from not understanding orgs in the first place.

An unhappy org that doesn't produce has usually been manned only partially and out of sequence.

The trick is planned manning, ignoring the screams of those who know best or demand personnel; just manning by posting those who have been screamed for the loudest is a sure way to wind up with no people and total org problems instead of a total org that is prosperous and producing.

Incidentally, this is a rough approximation of the sequence of hats the ED gradually unloads as his org takes over.

PRODUCTION QUOTAS

Ref: HCO PL 8 Feb. 72 — Exec Series 7
TARGETING OF DIVISIONAL
STATISTICS AND QUOTAS

In a recent pilot, executed at my orders by the Staff Captain, it was found that:

WHERE A STAFF MEMBER DOES NOT KNOW THE SUBPRODUCTS WHICH GO TO MAKE UP A GROSS DIVISIONAL STATISTIC THE GDS WILL SUFFER AND FALL.

And it was also found:

WHERE SUBPRODUCTS ARE NOT GIVEN A QUOTA, QUOTAING A GDS FAILS.

The report on the pilot follows and is given in full as it is an excellent example of what a product officer or executive runs into and how it is solved.

"During the last two weeks, while running the FSO, I've had a lot of experience with the above subject, and thought that the data that I have on it might be useful to you.

"When first going into the org I pushed for actual products along with quotaing of the GDSes.

"This went over very well, however, the day you sent a telex *to quota the products that make up the stat,* things really started moving much better.

"Your telex really opened the door for me as to how to go about getting an org to work on products and get stats up.

"Here is the best example. The week before last on Monday or Tuesday the student points were heading for bad down stats for the week. The D of T was more or less tearing her hair out about how she could meet her quota. She and the Tech Sec were trying to figure out what had changed.

"This was right after I had read your telex referred to above, so what I did was to tell them how they had to work on the products that make up the stat.

"The next step was *to list out what the subproducts were that made up the stat.* I just made a very simple list, not necessarily a complete one, of: (1) course starts, (2) F/Ning students, (3) students that are on target, (4) students that increase their production daily. Then made sure the D of T would understand how these made up the stat.

"The next step after that was to change 1–4 above into 'number of.'

"This brought about what one could call instant sanity and exclamations of realizations of how the area could be handled.

"This was followed up by making the D of T work on each of these products. It took a lot of work and figure out how to do, as far, far from all students were F/Ning, etc. It took actions like finding every bogged student and debugging him on a flat-out basis.

"The end result was that the stat did not crash, but went up some, and this week went up even more.

"Other actions were required in the area, such as the Qual Sec and Chief Off sorting out the TRs Course, the D of T doing TRs, and more, but it worked for sure.

"After this, we made this the pattern for the dept heads to follow: i.e., work on the products and subproducts that make up the stat, list them out, quota them, make the quotas, make your GDS quotas.

"It has also been put in on Dept 18 lines, so that Tours and external Reges are no longer pushed on GI and bodies only. There is a pilot project with Flag Service Consultant WUS since a few days which puts in a whole subproduct system and quotaing and reporting on it, which was very well received.

"However, what I also wanted to tell you, is that *this does not go in automatically,* we're still catching bugs on it.

"These are the bugs that have been run across:

"1. Dir Reg had a bunch of subproducts and products beautifully quotaed, but when asked what his quotas were for 'closes' and 'completed Reg cycles,' he dropped his jaw as he had not thought about that.

"He immediately quotaed these and production increased right away.

"2. The Dir Procurement (Dissem Sec HFA) had not set any quotas for CF/Address as she stated that 'that area would not be possible to quota.' Her MU was that she thought she had to quota every single area of Addresso, rather than the part they were working on at the moment. She had a major win on this.

"She also kept her quotas in her head as she 'hated to have papers lying around.' She since has them all in a book and is very happy.

"3. The Dist Sec could not think of the subproducts that would produce NNCF.

"4. The Dir Income was working on subproducts in such a way that they did not add up to his GDS, or rather, that they did not result in his GDS quota being met, and tried to justify this.

"Several others required close personal contacts to list out what the products would be that made up their stat.

"MUs are still coming up, but it sure works! It's brilliant, Sir.

"My picture of an org that operated on this basis with every staff member should be incredible.

"Now, I have looked at the trouble an executive would run into implementing the order to quota products that make up stats, and I can see lots, unless you know exactly how to do it.

"This is what I see on it:

"You would have to keep the GDS quota there and in mind constantly, as if you don't, things can slack off too easily.

"You would have to bring the terminals concerned to an understanding of the cycle of working on products that make up the stat.

"You would have to get a list of what the products and subproducts are, without making it miles long.

"You would have to make sure that the list is complete, per policy and actually makes up the stat.

"You would then have to make sure that the list is quotaed.

"You would then have to make sure that the quotas are met, and you would have to watch out for anyone using it wrongly so the GDS quota is not met.

"On most of these you would have to make sure that there are proper 'figure out how to do's,' on how to go about getting the products.

"The above actually, now that I look at it, fits in exactly with your PLs on Name, Want and Get the Products.

"I think also what is of importance is that you really break down what it takes to get the products: i.e., if the DTS here was told to get 10 fully paids into the org, she would be 'blank,' until you broke it down into — make up the list of them, make so many contacts, get so many ETAs, etc.

"Pressure is still required to get a momentum and keep it going.

"Another example is getting out over 100,000 pieces of promo in one week. It takes incredible detailed planning that covers everything; when what has to be through I/A and on to the assembly line, what checks have to be gotten when, what has to be addressed when and franked, what all hands are needed and when, etc. I had to force through exact planning on this with targets assigned, etc., and then push like mad.

INDEX

"The use of HCO PL 8 Feb. 72, Exec Series 7, TARGETING OF DIVISIONAL STATISTICS AND QUOTAS, is also very important in all this."

Therefore these conclusions can be considered valid and vital:

EVERY GDS MUST BE BROKEN DOWN INTO SUBPRODUCTS AND THE STAFF MEMBERS MUST KNOW THEM IN ORDER TO ATTAIN A GDS.

And:

EVERY SUBPRODUCT MUST BE QUOTAED FOR A GDS QUOTA TO BE ATTAINED.

SUBPRODUCTS
HOW TO COMPILE A SUBPRODUCT LIST

If you take any VFP and trace it backwards step by step, using a BE–DO–HAVE breakdown of what it took to create it and then wrote up the list as preliminaries, you would have a subproduct list.

Let us take a cup of coffee as the VFP. The minimum subproducts list would divide into what you had to be, what you had to do and what you had to have to wind up with a cup of coffee.

Be: Somebody who wanted a cup of coffee, somebody hatted to make coffee.

Do: Boil water, add coffee, put coffee in a cup, put it someplace where it could be drunk, let it cool until it was drinkable.

Have: Money to buy the necessary, or the ability to make money so you can buy the necessaries or the skill to create the necessaries: water, a pot to boil water in, fuel to make a fire, a fire to put a pot on, time to boil the water, coffee, the skill to make a cup of coffee, a cup to pour it in when made, a place to put it or drink it.

Now when you put this into a sequence of actions you will see that it looks like a doingness list. So you would have to add the havingness list and there would be no point in it unless you brought about the beingness list.

Now, from the above you could work out the subproduct list of a cup of coffee. Now, if at some future date you found out there was something wrong with the coffee valuable final product all you would have to do is assess this list and find out how come no VFP. The subproduct omits and wrong targets would leap at you and, if handled, could result in the VFP of a cup of coffee quite promptly.

And if you yourself were not involved in making the cup of coffee you would be able to debug how come no cups of coffee.

And if other departments or people had to be convinced there was valid reason for no cup of coffee you would use the list.

So as an exercise why don't you compile the subproduct lists for a cup of coffee.

When you get into anything as vast and complex as an org you can see that subproduct lists are vital to the understanding and accomplishment of VFPs.

And you would not be asking do you have to have one staff member for making each step of making a cup of coffee.

Now, as a second exercise take a valuable final product and break it down yourself, just like we broke down the cup of coffee, and searchlights will play against the sky, bands will strike up and understanding will reign everywhere and so will VFPs.

Not getting pcs audited? Not getting students trained? Not getting mobs of people walking in the front door? Not buying new buildings? Not having a highly trained expert staff? Do some subproduct lists and assess them and you'll know all about it.

USE AS ORDERS

If a valid subproduct list is used as a basis for issuing orders to a staff member, a section, department, division or org, they will be right targeted and valuable final products result.

It will greatly increase org efficiency and show up holes.

When the orders are issued and VFPs do not appear you will know what you are getting and what you are dealing with: Noncompliance? Sabotage? Overload? No recruitment? No hatting? R/Sers? Misguided staff? or what? Well that would be up to you to investigate and you have a guide of the subproduct list and what didn't or couldn't occur and get busy and do something about it.

USE AS QUOTAS

Subproducts can be quotaed and should be but they can only be quotaed in view of what can be done with what one has.

When you quota just one subproduct in a long line-up of other unquotaed subproducts, you can get into a situation where the subproduct or the quotaed subproduct is lacking support and so won't occur. In this case you can see that the subproduct gets the support while being obtained on a cope basis.

You can't just chant a lot of figures at a staff.

It is safer to quota the doable and then gradually add quotas to new doables as your facilities and capacity expand.

You can quota an HGC on pcs gotten into session. But remember you will also have to quota Tech Services phone calls and letters.

To do quotaing you have to know how to "play the piano" and have to be totally knowledgeable of existing scenes at any given moment. It is not an ivory tower job.

You can quota 500 file folders filed but remember you had better quota, for that time only, 500 file folders if there are none.

Quotaing does result in subproducts which result in VFPs and should be done.

But it is a highly educational process. The response can be anything from "They don't make them anymore" to "The auditors have no pens" or "It's busted" but the point is whatever turns up on quotaing, you can handle it.

If you don't quota you probably won't have anything to handle and the result is a nice soft idle life of total poverty for one and all.

Subproduct lists are made for those who are not dedicated to the cult of poverty and destitution.

So quota and very soon you will find out more about playing the org piano than ever before and you may even get some VFPs too which is after all the label of the game. If you misquota too often and don't learn in the process you'll probably get a mutiny.

It's fairly certain that if you quota nothing you won't ever get a cleared area. So quota away and quota intelligently.

DEBUG USE

A major use of subproduct lists is debugging the absence of high quantity, high quality valuable final products or no product at all.

As it is VFPs which keep an org going, not promises or hope you can see that a subproduct list is vital to straighten out an area.

By assessing the subproduct lists against a direct inspection of the area to which it applies one can see the major things that are missing. It is these missing things which are preventing the attainment of the valuable final product of the area, so vital to the org's survival.

UNDERSTANDING

A subproduct list enormously assists an understanding of what an area is supposed to be doing.

It will be found that staffs in a section or department or even division don't really know what it is supposed to be doing.

By simply taking up the subproduct lists with them point by point, they will suddenly envision the VFP and see what it really is.

PRODUCTION

People can be very busy without producing anything. The busyness of people can sometimes be rather misdirected.

By having an exact list of subproducts, a staff gets a very good reality on what productive busyness is. They will coordinate their busyness and drop out nonproductive busyness and real org VFPs will begin to appear.

ORGANIZATION

As an org is compartmented, staff members in one part of an org or even in one part of a department have no view of other areas and don't know what they are supposed to be doing. A subproduct list is highly informative to them. What *is* supposed to be coming out of that other area?

Also a staff member is a part of a flow line. If he has no idea what the point earlier on the line is supposed to be doing and what the point later on the line is supposed to be doing, he sometimes can't see the value of what he is supposed to be doing and does not take adequate responsibility for it as he may not conceive how important it is to the VFP.

A case in point of this — you won't believe it — was where a Division 2 could not understand why they got no re-signs until they found out that F/Ning students were a subproduct of the Academy. When they discovered this — and that there were no F/Ning students in the Academy but an awful lot of high TA students — they couldn't do anything about their own plight. (Needless to say the fur flew at the staff meeting.) Thus, using subproduct lists, a part of an org can improve itself and its own VFP by knowing what subproduct another part is supposed to be producing.

INCOMPLETE LISTS

Where you have incomplete subproduct lists — and probably no subproduct lists are perfect — you can get a false sense of security.

An incomplete list does not operate well as a debug list. Thus subproduct lists have to be intelligently used and often recompiled. They also have to be suitable to the activity for which they are compiled.

WRONG LISTS

Where a subproduct list is wrongly worked out the staff in that area can be mistargeted and can be made very busy again with no VFP.

The test of any subproduct list is: Is it resulting in VFPs? If not, somebody has been busy making a staff busy.

The test of a correct subproduct list is does it result in good VFPs when used.

And knowing all this, you can now act and the VFPs will now magically appear.

It's all just magic after all isn't it.

HCO POLICY LETTER OF 20 JULY 1978

REMIMEO

ORG SERIES 38

HELD FROM ABOVE
DOUBLE–HATTING

There are two types of double-hatting.

One of these, we all know about and is very common and quite permissible. This is what might be called *"level"* double-hatting. In this, for example, Mimeo Files is also Mimeo Files Equipment. So long as one does not have a hat in each of separate divisions and the hat is all in one division (and in a large org all in one department) not too much strain and trouble will result.

The other type of double-hatting can be called *"vertical"* double-hatting. In this, the head of an area *also* holds an I/C hat in his own area.

We see this in "HFA" on org boards. "Held from above" is very common. A Tech Sec is also D of P.

Well, in a small org that isn't making any money and isn't delivering, this would be usual. Probably the Tech Sec would also be the only auditor.

But we are talking here about busy areas that produce where we condone too much "HFA."

Vertical double-hatting is a sure way to be under stress.

Example: The Artillery Officer, I/C of all artillery, takes on the hat of "Ammunition Inventory I/C." Well, he's so tied up in counting shells he omits to notice — as he should as Artillery Officer I/C — that they just lost their guns. Result — lost battle, court-martial. And all because he was vertical double-hatted.

When a person occupies two points of different level on a command channel he is asking for trouble. He is busy on the lower point, usually because it is a full-time doingness, and so neglects many other sectors that should be supervised from the higher point.

When I see "D of P" marked as HFA by the ED, I don't have to look at stats or future Ethics Orders for that org. I know exactly what they will be. The D of P post might be being done but the org will be in a shambles for lack of active supervision. The ED will soon be the subject of a mission.

Yes, one can do it for a week — even a month at times. BUT if one does not straighten it out he'll be on the aspirin route.

Advice to any I/C who is vertical double-hatted is:

1. Recruit
2. Train
3. Hat

the lower post quick and see that it produces.

CRAWL BACK UP THE ORG BOARD.

The post of SERVICE PRODUCT OFFICER is hereby established in the Office of the CO/ED, Dept 19, of all Class IV and Sea Org orgs. His direct senior is the CO/ED.

Until such time as a SERVICE PRODUCT OFFICER is posted the responsibilities and duties are covered by the Service/Call-in Committee as fully laid out in HCO PL 9 Aug. 79 I, CALL–IN: THE KEY TO DELIVERY AND FUTURE INCOME and HCO PL 9 Aug. 79 III, SERVICE CALL–IN COMMITTEE.

The VALUABLE FINAL PRODUCTS of this post are (1) flawlessly serviced and completed paid pcs and students who re-sign up for their next service, and (2) high quality promotional items in the hands of volumes of public who come in, sign up and start an org service.

The main statistics for the SERVICE PRODUCT OFFICER are:

1. Number of pcs and students completed and re-signed on to their next service. (This includes those actually routed on to the next upper org for services and who do re-sign.)

2. Number of public in and started on to a service.

Completion: By completion is meant those actions completed and attested at C&A and accompanied by an acceptable success story.

Re-sign: By re-sign-ups are meant pcs and students who, after completion of a service, see the Registrar to sign up *again* for another service while in the org.

Promotional Items: Those items which will produce income for the organization. By promotional items are meant those things which make Scientology and our products known and will cause people to respond either in person or by written reply to the result of receiving Scientology commodities. These are: tours, book outlets, Sunday services, events, upstat image, fliers, info packs, handouts, books, ASR packs, specified service promotion, etc.

There are of course many other stats that reflect the SERVICE PRODUCT OFFICER'S subproducts and these are: VSD, TOTAL GI, INTENSIVES COMPLETED, BULK MAIL OUT, NUMBER OF PROMOTIONAL ACTIONS OF THE ORG IN, NUMBER OF FULLY AND PARTIAL PAIDS GOTTEN INTO THE ORG AND ON TO THEIR NEXT SERVICE. These are very important parts of the SERVICE PRODUCT OFFICER HAT, as they reflect his subproducts which lead to his valuable final product.

SERVICE PRODUCT OFFICER RESPONSIBILITIES AND DUTIES

The purpose of an organization is to deliver service to the public. The primary functions which add up to delivery to the public are: promotion, sales, call-in, delivery itself and re-sign. The Service Product Officer is responsible for the flow of *products* through these areas. He is a *product officer*. He names, wants and gets products in these areas and thus ensures that the organization is accomplishing its purpose of service to the public.

The full technology of product officers is explained in the Flag Executive Briefing Course lectures, where the product–org officer system was developed. This system is still fully valid and is, in fact, the tech of the Service Product Officer. He is solely interested in products. When the Service Product Officer comes across a situation that

requires organizing, he gets his organizing officer to handle it. The O/O (organizing officer) should actually be operating a few steps ahead of the Service Product Officer at all times — organizing for immediate production, per the product–org system. A full study of the product–org system, as contained in the FEBC tapes, the Org Series and AKH Series 33, 34 and 35, NAME, WANT AND GET YOUR PRODUCT is recommended in order to attain a thorough understanding of the actions of the Service Product Officer and his organizing officer.

The Service Product Officer is not a stopgap at any point of the promotion, sales, call-in, delivery and re-sign lines, where executives have failed to post and hat staff. This would be the responsibility of the Exec Establishment Officer per Esto Series 1. Establishment Officers see that short- and long-range establishment are occurring in the organization in the form of recruiting, hatting and training of staff. The Esto system is a necessary and very vital tool for the Service Product Officer and the organization and should definitely be in full use.

The Service Product Officer has the authority to directly order or work with any terminal involved in the promotion, sales, call-in, delivery or re-sign areas so long as he maintains direct liaison with their seniors.

The Service Product Officer must be fully aware of every post in the org and what their jobs consist of. He must know who handles what cycles and what cycles are on the lines. For instance, it is up to the Service Product Officer to be aware of all promotional actions occurring in the org and who is doing them, or if they aren't getting done. He must be aware of what public aren't getting serviced and he ensures those responsible get them serviced. He doesn't do this himself, as a serious goof of any product officer would be to go down the org board and do the job himself. The Service Product Officer *must* ensure others get the work done. Otherwise, he would wind up doing everyone's post and not getting anything done. It's actually pretty overwhelming to think of a Service Product Officer as responsible for doing everyone else's post duties. That's the surefire way to sink fast. Where a product isn't getting out the Service Product Officer debugs it using HCO PL 23 Aug. 79R I, DEBUG TECH, in order to get production. He is not interested in first finding the person's Mis-U or excuse, he is interested in getting production occurring now. Let the org officer and Qual worry about the staff member's Mis-Us.

Divisional Secretaries are the product officers for their division per the product–organizing officer system. The Service Product Officer sees that the product officers over the whole delivery cycle are getting their products. He coordinates the flow of products from division to division. A Service Product Officer doing his post fully and properly is, in fact, the person that makes the org board work. He sees that products aren't jamming up at one point of the line, but that they continue through the organization.

The Service Product Officer walks into the Tech Div and finds the Tech Sec sitting at his desk, shuffling paper and the pcs are piling high and complaining about no service. The last thing the Service Product Officer would do is start organizing the Tech staff around and scheduling the pcs. No sir, that's a serious offense. The first thing he would do is find out what can be produced RIGHT NOW, what auditors can be gotten into session right now and make the Tech Sec do it and GET IT DONE. This all takes about fifteen minutes and he gets the area flowing again and then,

WHAM! . . . he's out and into his next area. The Service Product Officer would not sit down and just start word clearing or doing Exchange by Dynamics on the Tech Sec. He would unstick the flows and get them moving. Then he would alert HCO and Qual to this serious problem of unhattedness and demand it be handled.

The basic sequence of the Service Product Officer on getting the products flowing off the lines is PUSH, DEBUG, DRIVE, NAME IT, WANT IT, AND GET IT. That's the only way you ever get a product. Products don't happen on their own.

This means he tells the Tech Sec to get Joe Blow there in session now! There is no general "audit these pcs." You'd never get a product that way.

The CO/ED has no authority to order the Service Product Officer to perform the total duties of any one post. The Service Product Officer must guard against being stuck into one post after another, doing it all himself. Nor is the Service Product Officer an "expeditor" for the CO/ED.

It is also very important that the Service Product Officer advise seniors that he is going into their areas so as not to create a Danger condition and wind up having to run the entire org. He also does this by getting the seniors to handle their juniors so a product is gotten. He does not walk in and cross-order the seniors of areas but works with them to see that products are produced.

The Service Product Officer is one who comes up with BIG IDEAS on getting public flooded into the org and being serviced swiftly. He is the one who thinks along the line of PRODUCTS, PRODUCTS, PRODUCTS. By spanning the divisions, he coordinates the product wanted and ensures each division is aware of its part in getting this product and that their actions are uniform. Where the Service Product Officer spots diversity, or lack of uniformity, he must alert his org officer or HCO. By doing the actions of coordination for a product and product demand, the product officer creates a team and more importantly sets the pace of the org's production and morale.

ORG LINES AND THE SERVICE PRODUCT OFFICER

There are certain aspects of the organization which the Service Product Officer must be thoroughly trained in to do his job properly.

The Service Product Officer must be fully aware of all the Valuable Final Products (VFPs) of each department and each division of the org. Without this the Service Product Officer can create havoc, as he would be ordering Division 6 to recruit or the Reges to supervise. By not knowing cold the org VFPs, the Service Product Officer would certainly jam the flows throughout the org board.

A serious fault in any executive is not knowing the functions of terminals and the relation of one terminal to another. A key function of any executive is that of routing. An executive that misroutes communications and particles will tie his org in knots and wonder why no products are coming out. Therefore, a Service Product Officer must know cold every post function in the org and what particles belong on what lines.

He has got to know where a product comes from and where it goes in order to see it through the lines. A product officer's job is to name, want and get a product. However, he must first know where that product is to come from and where it is to go. This is an incredibly fundamental point.

In order for org lines to flow, routing forms (RFs) must be used. A routing form is a full step-by-step road map on which a particle travels. Every point a particle (which could be a student, a pc, mail, etc.) must go through to wind up at its destination must be listed on the routing form.

The Service Product Officer's Organizing Officer must ensure routing forms exist and are in use for each and every line in an org he deals in. Both he and the Service Product Officer must know these forms cold and be able to instantly spot when a line is being abused or ignored so as to slam in the correct routing.

A Service Product Officer must fully clay demo all the lines of an organization for each and every product. This must include each particle from entrance to the org and through all lines on which that particle would flow until it leaves the org. Lines are the most fundamental point of administration. To not have a full grasp of these lines would be detrimental to any product officer.

SERVICE PRODUCT OFFICER SEQUENCE OF ACTIONS

It is very easy for the Service Product Officer to become wrapped up in one area while neglecting the others; however, this must not be done as, while products might be getting through in one area, they may well be seriously bogging in others.

The Service Product Officer is concerned with promotion, sales, call-in, delivery and re-sign. He begins his product officering in promotion and gets products out there or started and moves on to sales and gets them on to getting their products and so on through call-in and delivery and re-sign. He then returns to the beginning, promotion, and follows up on what he started there and gets even more production out. This is basically how the Service Product Officer moves through the org.

Daily, the Service Product Officer must plan and battle plan out his day. He must list those products he intends to achieve in each one of his areas and then get them.

The Service Product Officer is not an "information courier" or "data gatherer." He is ahead of the game and *knows* the data. He must know what public haven't been regged in the org yet, he must know who hasn't been taken into session that day, or who has been stuck in Ethics for three days, and ensure these things get handled. Therefore he must be quicker and faster than anyone else in the org and run run run.

PROMOTION

Promotion is the first action of the SERVICE PRODUCT OFFICER. He must ensure the many promotional pieces and actions are getting done. Some of these are:

1. Selling of books.
2. Staff selling books.

3. Books placed in public bookstores.
4. Selling of books to FSMs, missions, distributors, retailers and salesmen.
5. Books sold on each public contact.
6. Books advertised in mags, ads, posters, fliers, etc.
7. ASR packs.
8. Info packs.
9. Div 6 handouts for lectures and free testing.
10. Posters on major services in Div 6.
11. Promo to field auditors, FSMs, Gung-ho Groups, Dianetic study groups.
12. Org mags.
13. Flag shooting boards.
14. Promo for future events and tours.
15. *The Auditor* (for SHs).
16. *Clear News*.
17. *Advance!* mag (for AOs).
18. *Source* mag (FSO).
19. I Want to Go Clear Club promo (AOs).
20. SHSBC/NED/internships/NOTs/grades, etc., specified in promo.
21. Promo at points of public inquiry.
22. Free testing ads.
23. Fliers inviting people to buy Scientology books.
24. More Info Cards used in books.
25. Ads in newspapers.
26. Questionnaires to detect people's plans for training and processing.
27. Enough letters to public so they come in.
28. All promotional actions per HCO PL 20 Nov. 65RB I, THE PROMOTIONAL ACTIONS OF AN ORGANIZATION.
29. Book seminars, public campaigns and lectures.
30. Public Reception display (books, posters, handouts, etc.).

31. Tours and events, Sunday service.

32. Free testing line.

33. Handling of Gung-ho Groups, keeping FSMs well supplied and supervision of Dianetic study groups and FSMs.

34. Test Centers outside the org as an extension.

35. Radio and TV advertisements.

36. Dept 17 services.

37. Reception greeting, handling, routing, chasing up people for appointments and handling incoming calls with ARC and efficiency.

38. Formation of Dianetic Counseling Groups.

39. Weekly tape and film plays.

40. Promotes the org and standard tech to Auditors Association.

41. Contacts and sees any sign of ARC broken field and alerts Chaplain to clean up the field.

The first thing a Service Product Officer would want to do is get out a large volume of promo to at least get some activity occurring. This would entail Dissem getting any promo laying around the org dug up and sent out to students and pcs. They would get it out in letters and mailings, they would get it handed out to students and pcs, they would pick up the half-completed promo piece, have it fixed up and sent out. They would have promo placed in Reception, in any public inquiry, etc. In other words, the Service Product Officer ensures that the org fully utilizes what promo they do have. He would also have specific promo pieces done to enlighten the field on what services the org has. Where any of this bogged he would push — debug — drive — name it — want it — and get it.

The Service Product Officer, in trying to get in any promotional items, must review what resources he has. For example, is there a Dir Clearing, is there a Receptionist, etc.? He must concentrate on getting those terminals that already exist busy on promotional actions that will create the largest volume of inflow, while his organizing officer works on getting more immediate resources to increase the volume even further. It would be senseless to have the Dir Clearing running around trying to form up groups in an inactive field, single-handing, when he has FSMs that need to be gotten on to selecting and driving in new public. The Service Product Officer is concerned with priorities of promotional actions, so must be totally aware of all the promotional items and actions that an org can produce.

Actions such as “improved org appearance,” “high ARC handling,” and “correct and efficient routing of public” can be put in instantly. If he has two people in all of Dissem he still can and must get the particles flowing and products coming off the line.

SALES

The sales lines consist of enlightening the public, having lines to sign people up, getting public into the org and signed up for service.

The following gives you an idea of some of the sales actions and lines in an org:

1. Body Reg phones and schedules public to come in for interview.
2. Use of CF to produce business.
3. Reges who accept advance registrations.
4. D of T procurement of students.
5. D of P procurement of pcs.
6. Receptionist sells to public coming in.
7. SHs in communication with the Class IV org Tech Secs and Registrars and targeting them for public completing and routing on to the higher org.
8. AO's and SH's case consultant actions.
9. AO/SH events to Class IV org Academies to encourage upper-level auditor training.
10. Use of FSMs, Auditors Associations, personal contact, etc., to get public into the org and on to their next service.
11. Fast lines so public are not left waiting to see the Reg.

The lines of routing a public person to the Reg, or from the Reg to a service, must be tight so public aren't lost and the Reg is continuously kept busy with the public. Therefore, the Service Product Officer must police these lines and where he notices any lack of uniformity he gets his org officer onto it. Nonuniform or slow routing interferes with the product, so the Service Product Officer gets it speeded up now by push — debug — drive — name it — want it — and get it.

The first actions of the Service Product Officer in the sales area are to get all "in-the-org" public routed to the Reg on breaks or after course end to be further signed up for additional service. He can also have Dissem drilling done with Reges so as to increase sales in the org. His operating procedure is products, products, products, now, now, now. His org officer or HCO and Qual can worry about organize, organize, organize.

CALL-IN

Call-in is the action of getting fully paids into the org on to their next service. This also includes getting partially paids fully paid and on to their next service. These functions are of great concern to the SERVICE PRODUCT OFFICER as undelivered services to the public can mess up a field and increase the chance of refunds. The Service Product Officer should see to it that the Call-in Units are given stiff targets and that their production is not monitored by low auditor hours or low-producing training

areas. The execution of needed programs to get Call-in Units fully operational is under the Service Product Officer per HCO PL 9 Aug. 79 I, CALL–IN: THE KEY TO DELIVERY AND FUTURE INCOME. This same policy also lists out the functions of the Call-in Units. Call-in falls between sales and delivery, as it deals with those either fully or partially paid and needing only to finish payment and be called in and gotten on to service.

DELIVERY

The Service Product Officer must ensure that the service lines of the org are fast and 100 percent standard, that pcs and students do complete quickly and don't get lost off the lines.

The Service Product Officer is to have an alert line with the public set up whereby if a student or pc's study or auditing is slowed, or if the public person is dissatisfied in any way, he can alert the Service Product Officer so it can be handled.

Some of the actions and lines to be product officered by the Service Product Officer are as follows:

1. Tech Services arranges housing, has the pc met when he is arriving and generally operates as the pc's host while in the org.

2. The many lines such as pc to Ethics, pc to Examiner, student to Ethics, student to Qual, C/S Series 25 line and pc to D of P line must be drilled so they are flawless and handled with ARC.

3. The most senior policy applied to this area is HCO PL 21 Nov. 68 I, SENIOR POLICY, "WE ALWAYS DELIVER WHAT WE PROMISE."

4. There must be an adequate amount of auditors, Tech Pages and FESers, Ds of P, Supervisors, Course Admins, etc.

5. The auditing line must be fast so no pcs wait to be serviced.

6. Use of all hands tech terminals in the org auditing when required to handle backlogged service.

7. Getting students through their courses and on to their internship at which point they can audit in the HGC.

8. Proper scheduling so every pc gets in 12½ hours a week minimum.

9. Recovering blown auditors, getting them fixed up and auditing.

The Service Product Officer ensures tech lines are fast. For instance, a pc's folder not getting C/Sed for days, or idle auditors and Ds of P "waiting" for pcs when they can be made to procure pcs, must be spotted and handled by the Service Product Officer.

The Service Product Officer must be kept briefed on what pcs and students arrive and how they are going to be handled. He must get around to these areas (Training and HGC) to ensure that there are no slows with public or anything that would get in the way of public receiving top-quality service.

Service to the public is the reason the org is there and service must be kept fast and 100 percent standard and plentiful. This is a primary duty of the Service Product Officer; he is there to ensure this occurs.

It is losses on service that keep public away, org income down and staff pay low.

RE–SIGN–UP

The re-sign-up line is also very key to an organization's prosperity. It brings further income, and proves conclusively that the last service received by the public person was of high quality. This is why the Service Product Officer must be very alert to the amount of re-signs. Some of the things that should be watched for are:

1. That the Reg is supplied with an upstat cert for his last completed service to present to the student or pc.

2. That the Reg knows fully how to handle the public person that won't re-sign (by sending them to Qual).

3. The Reg must be provided with tech estimates, Grade Chart information, etc., so he is aware ahead of time of what the student or pc's next action is.

4. Tech terminals are fully briefed and the line is in that every completion gets routed to the Reg. This must be drilled.

The public person should be serviced in your org until he/she requires upper-level service that your org cannot deliver, at which point they should be directed to the next higher org.

PITFALLS

The Service Product Officer can lose his effectiveness if he takes any "hey you" orders or gets stuck in at various points. He is not an expeditor. He is not an information and full-time coordinator terminal. He is an executive, a *product* officer, and he is there to ensure the entire machine runs.

He must be well versed on actions occurring in the org. He must also pay strict attention to completing actions he has started and to carrying a handling through to a done. Otherwise he can wrap himself around a pole with incomplete cycles which will ball up the line and prevent the service lines from flowing flawlessly.

Where the Service Product Officer post bogs it is undoubtedly due to a lack of an organizing officer, as with the speed in which a Service Product Officer demands products, he requires a fast-moving org officer. So it is essential this post be provided with an org officer as soon as possible.

Those personnel in the org who are responsible for organization, any Esto personnel, etc., are the people who put the units in the org there. It is not the duty of a Service Product Officer to man and hat the org. Therefore, it is a lot of sweat off the Service Product Officer's brow to have a fully functioning Esto team backing up his actions in getting the flow of products out of the organization.

SUMMARY

The Service Product Officer ensures all the actions of getting public into, through and out of the org are *accomplished* with high quality results.

It is extremely important that this post be manned in each and every org. It doesn't just make the difference between a poor, empty org and a good org. This post makes the difference between a good org and a booming org.

PRODUCT OFFICERS

(Originally written by LRH for the *Apollo* OODs of 11 June 72.
Issued as an HCO PL on 21 Sept. 80.)

Worked last evening getting Tech to start shooting them through to completions.

The PL on Selling and Delivering Auditing (HCO PL 28 Sept. 71) tells why you have to audit a pc all at once, whole program. Dribbling it out means repairs due to life upsets before the guy made it.

So crowd it on and get a pc *through*. Then we'll have some products for our coins.

A product officer has to name, want and get his products.

This means one says, "You there. Joe Blow. Want him completed. All right get it DONE." Product by product. There is no general "Audit these pcs." "Get up the hours." Hell, you never get a product that way.

"You there, George Thunderbird. I want you through your Primary and onto and through course and classified. Get going, man, get going. Oh, you were told to weedle the toofle before you woofled by Dorance Doppler. Org Officer? Get that name — to Flag MAA, get the cross orders the hell off my lines. Now you George Thunderbird, I want you through your Primary and onto and through course by 1 July. You got it? You got it now! Good. Well, get with it. Get going!" Note on clipboard: Org Off to get cross order by Dorance Doppler invest and report. "There's your slip." Note on progress board. Geo Thunderbird HSDA 1 July. "Now you Tobler Tomias, what's the tale; how are you going? . . . Well, standing there smoking and looking at the scenery isn't going to do anything. If your girl doesn't like you anymore the thing to do is drown your sorrows in the Primary Rundown. . . . Okay, you are to be an Expanded Dianetics. All right, that's fine. I want you completed by 16 July. . . . I don't care if that's a 16-hour day. Let's see, Primary Rundown by _____ and Class IV Acad by _____ and _____. Yes, that's 16 July AT NOON. Man, to hell with your PTPs. Get going, man." And on the progress board. And from the board — "And here's Bill Coal. He should be off the Primary today, where is he? All right Bill — ah, you made it that far. Now you're on schedule. That's great. HSDA. Get with it, man. You completed Primary 20 minutes ago and aren't on the next course. Super! What the _____."

That's the way it goes for a Tech Prod Off. "We are finishing Agnes, Torp and Goshwiler today. Today. Yes today. Certified and off lines. Got it, D of T? Well, do it!"

Push, debug, drive. Name it, want it, get it.

That's the *only* way you ever get a product.

Sad but true.

They don't ever happen by themselves.

And all the public relations chatter in the world is not a product. I know this product officer beat.

It's a piece of cake.

But it has to be DONE.

ORDER VERSUS DISORDER

Refs:

HCO PL	9 Feb. 74R Rev. 17.2.80	CONDITION BELOW TREASON CONFUSION FORMULA AND EXPANDED CONFUSION FORMULA
HCO PL	30 Dec. 70	Personnel Series 15 Org Series 20 ENVIRONMENTAL CONTROL

I made a breakthrough recently, while investigating low production areas, and realized that a good deal more needs to be said on the subject of order and disorder.

Order is defined as a condition in which everything is in its proper place and performs its proper function. A person with a personal sense of order knows *what* the things in his area are, he knows *where* they are, he knows *what* they are for. He understands their value and relationship to the whole.

A personal sense of order is essential in getting out products in an area.

An orderly typist, for instance, would have all the materials requiring typing, she would have ample paper and carbons within arm's reach, she would have her correction fluid to hand, etc. With all preparatory actions done, she would sit down to type with an operational typewriter and would know what that typewriter was and what it was for.

She would be able to sit down and get her product, with no wasted motion or stops.

But let's say you had a carpenter who couldn't find his hammer and he didn't even know what a hammer was for and he couldn't find his chisel because when he picked it up he put it down and couldn't find it again and then he didn't know where his nails were. You give him a supply of lumber and he doesn't know what it's for, so he doesn't categorize it where he can put his hands on it.

How many houses do you think he would build?

The actual fact of the case is that a disordered person, operating in a disorganized area, makes a ten-minute cycle into a three-week cycle (believe it, this is true) simply because he couldn't find his ruler, lost his eraser, broke his typewriter, dropped a nut and couldn't find it again and had to send off to Seattle for another one, etc., etc., etc.

In working with a group of nonproductive technicians recently, I discovered something interesting: out-basics. I actually found a lower undercut to what we generally think of when we say "basics."

These technicians had reportedly researched a key piece of equipment and had it all sorted out. But I found that they didn't even know the basic fundamental of what that machine was supposed to do and what they were supposed to be doing in their area!

That told me at once that they had no orderly files, no research data. They were losing things.

Now, if they were losing things, that opened the door to another basic: They couldn't have known where things were. They put down a tool over there and then when they needed it again they would have to look all over the place because they hadn't put it down where it belonged.

Their work was not organized so that it could be done and the tools were not known.

So I checked this out. Were they logging the things they were using in and out so they could find them again? Were they putting things away when they were done with them? No, they weren't.

This is simply the basic admin coupled with the knowledge of what the things one is working with are. It's orderliness and knowing what things are, knowing what they are for and where they are, etc. That's the undercut.

If people don't have a true knowledge of what the things they're working with are, if there are omitted tools, inoperational tools, if they don't know what their tools are supposed to do, if there are no files or if once used, files are not reassembled and put back in the file drawer, if things get lost and people don't know where things are and so on, they will be running around spending 3 or 4 hours trying to locate a piece of paper. That isn't production.

If a person can't tell you what the things he works with are, what they're for and where they are, he isn't going to get out any product. He doesn't know what he's doing.

It's like the carpenter trying to build a house without knowing what he's got to build it with, without understanding his tools and raw materials and the basic actions he must take to get his product. That's what was holding up production in the area: disorderliness. And the basics were out.

This is actually far *below* knowing the tech of the area — the actual techniques used to get the product. The person does not even know what his tools and equipment are or what they're supposed to do. He doesn't know whether they are operational or inoperational. He doesn't know that when you use a tool you return it to its proper place. When you have a despatch, you put it in a file where it can be retrieved. It undercuts even knowing the orders and PLs relevant to his hat.

What are the basics that are missing? The basics of sitting down to the table that one is supposed to sit down to, to do the work! The basics of knowing what the tools, materials and equipment he works with *are* and what he's supposed to do with them to get his product. Those are the basics that are missing.

We are down to a real reason why a person cannot turn out products.

That is what is holding up such a person's production. It is well below knowing the technique of his job.

Out-basics. Does the guy know where the file is? When he finishes with that file does he leave it scattered all over the place or does he put it back together and into the file where it can be found?

Now, a person who's working will have papers all over the place, but does he know where they are and is he then going to reassemble them and put them back in order or is he going to just leave them there and pile some more papers on top of them?

If you find Project No. 2 scattered on top of Project No. 1, you know something about that area. Basics are out.

This is a little piece of tech and with that piece of tech you've got insight. You would have to have an overall picture of what the area would look like when properly ordered and organized — how it would be organized to get optimum production.

Then you could inspect the area and spot what's going on. You would inspect on the basis of: How does the area compare with how it should be organized? You would find out if the personnel didn't know what the things in their area were or what they were for, you would see if they knew the value of things in the area or if there were altered importances, omitted files or filing, actions being done out of sequence, inoperational tools or equipment, anything added to the scene that was inapplicable to production, etc.

In other words, you can inspect an area by outpoints against this one factor of orderliness.

This sort of out-basics and disorderliness cuts production down to nothing. There just won't be any production at all. There will be no houses built.

What we are talking about here is an orderly frame of mind. A person with a sense of order and an understanding of what he is doing sits down to write a story or a report and he'll have his paper to hand, he'll have it fixed up with carbons and he'll have his reference notes to hand. And before he touches the typewriter he'll familiarize himself with what the scene is. He'll do the necessary preparatory work in order to get his product.

Now, someone else might sit down, write something, then dimly remember there was a note someplace and then look for an hour to find where that note was and then not be able to find it and then decide that it's not important anyway and then come back and forth a few times and finally find out he's typed it all up without a carbon.

There is a handling for this. Anyone trying to handle an area who doesn't understand the basics of what they're dealing with and is in an utter state of disorder must get a firm reality on the fact that until the basics are learned and the disorder handled, the area will not produce satisfactorily.

The following inspection is used in determining and handling the state of such an area.

INSPECTION

This inspection is done in order to determine an area's knowledge of basics and its orderliness. It can be done by an area's senior for the purpose of locating and correcting disordered areas. It is also used as part of debug tech as covered in HCO PL 23 Aug. 79 I, Esto Series 38, Product Debug Series 1, DEBUG TECH. It is for use by anyone who is in the business of production and getting products.

The full inspection below would be done, clipboard in hand, with full notes made and *then* handlings would be worked out based on what was found in the inspection (according to the Handling section of this PL and the suggested handlings given in parentheses below).

1. **DOES HE KNOW WHAT ORGANIZATION, FIRM OR COMPANY HE S IN? DOES HE KNOW WHAT HIS POST OR JOB IS?**

   This is a matter of does he even know where he is? Does he know what the organization or company he works for is, does he know what the post he is holding is?

   (If he is so confused and disoriented that he doesn't even know the company or org he's in or doesn't know what his post is, he needs to apply the Expanded Confusion Formula, HCO PL 9 Feb. 74R, and then work up through the conditions.

   Of course the person would also need to be instant-hatted on his post — the organization, his post title, his relative position on the org board, what he's supposed to produce on his post, etc.

   If he is doing this handling as part of his Expanded Confusion Formula, simply have him get the instant hatting and carry on with his Confusion Formula.)

2. **ASK THE PERSON WHAT HIS PRODUCT IS.**

   Does he know? Can he tell you without comm lag or confusion?

   You may find out that he has no idea of what his product is or that he has a wrong product or that he has confusions about his product. Maybe he doesn't even know he's supposed to get out products.

   (If this is the case, he must find out what his product is. If the person's product is given in policy references, he should look these up. If his product is not covered in tech or policy references, he'll have to work out what it is.)

3. **CAN HE RATTLE OFF A LIST OF THE BASIC ACTIONS, IN PROPER SEQUENCE, NECESSARY TO GET OUT HIS PRODUCT OR DOES HE HEM AND HAW ON IT?**

   Does he know what to do with his product once it is completed?

   He may try to tell you what he does each day or how he handles this or that and what troubles he's having with his post. You note this, but what you're interested in is does he know the basic actions he has to take to get out his product? And does he know what to do with the product once it is complete?

   (If he can't rattle off the sequence of actions 1, 2, 3, then he'd better clay demo the basic actions, in proper sequence, necessary to get out his product and then drill these actions until he can rattle them off in his sleep. If he does not know what to do with his product once completed, then he'd need to find out and then drill handling the completed product.)

4. **ASK HIM WHAT HIS TOOLS ARE THAT ENABLE HIM TO GET THIS PRODUCT.**

   Note his reaction. Can he name his tools at all? Does he include the significant tools of his area? Does he include his hat pack as a tool?

   (If he doesn't know what his tools are, he'd better find out what he's operating with and what it does. A good workman knows his tools so well he can use them blindfolded, standing on his head and with one arm tied behind his back.)

5. **ASK HIM TO SHOW YOU HIS TOOLS.**

   Are his tools present in the work area or does he have them out of reach, down the hall or in some other room?

   (He may have to reorganize his work space to get his tools within easy reach and to get in some basics of organization. The purpose of such organization would be to make production easier and faster.)

6. **ASK HIM TO TELL YOU WHAT EACH OF HIS TOOLS ARE.**

   Can he define them?

   Does he know what each of them are and what they are for?

   (If he doesn't know, he'd better find out.)

7. **ASK HIM TO TELL YOU WHAT THE RELATIONSHIP IS BETWEEN EACH ONE OF HIS TOOLS AND HIS PRODUCT.**

   (If he can't do this, have him clay demo the steps he takes to get out his products with each tool he uses, so he sees the relationship between each tool and his product.)

8. **ASK HIM TO NAME OFF THE RAW MATERIALS HE WORKS WITH. ASK HIM TO SHOW YOU HIS MATERIALS.**

   Does he know what his raw materials are? Are they in his work area? Are they in order? Does he know where to get them?

(He may have to find out what the raw materials of his post are [by defining them] and where they come from. He should drill procuring and handling them and then run Reach and Withdraw on them.)

9. **DOES HE HAVE A FILE CABINET? FILES? ASK HIM WHAT THEY ARE.**

   Does he know what they are for? Does he know what a despatch is, etc.?

   (He may have to be brought to an understanding of what files, file cabinets, despatches, etc., *are* and what they have to do with him and his product. He may have to clay demo the relationship between these things. He will have to set up a filing system. Ref: HCO PL 18 Mar. 72, Esto Series 10, FILES.)

10. **DOES HE HAVE A SYSTEM FOR LOCATING THINGS?**

    Ask to see it. Check his files. Does he have logs? Does he log things out and correct the logs when he puts them back? Are the comm baskets labeled? Does he have a specific place for supplies? Ask him to find something in his files. How long does it take?

    Does he have an orderly collection of references or a library containing the materials of his field? Is it organized so as to be usable?

    (If he has no system for locating things, have him set one up. Have him establish a filing system, a logging system, label the comm baskets, arrange supplies, etc. Get a reference library set up and organized. Drill using the system he has.)

11. **WHEN HE USES AN ITEM, DOES HE PUT IT BACK IN THE SAME PLACE? DOES HE PUT IT BACK WHERE OTHERS CAN FIND IT?**

    He'll probably tell you, yes, of course he does. Look around. Are objects and files lying about? Is the place neat or is it a mess? Ask him to find you something. Does he know right where it is, or does he have to search around? Is there an accumulation of unhandled particles around?

    (Have him clay demo why it might be advantageous to put things back in the same place he found them. Drill him on putting things back when he's finished with them. Have him clean up the place, handling any accumulation of unhandled particles.)

12. **IF FEASIBLE, ACTUALLY GO WITH THE PERSON TO HIS PERSONAL LIVING AREA.**

    Is the bed made? Is the area clean? Are things put away? How much dirty laundry does he have? Is it stowed in a bag or hamper or is it strewn about the place? People who had disorderly personal MEST, one for one were *not* getting out any products on post — they had no sense of order.

    (If his personal quarters are a mess, have him — on his own time of course — straighten up his personal area and keep it that way on a daily basis. This will teach him what order *is*.)

Some areas, of course, will be found to be in excellent order and will pass the inspection. These will most likely be high production areas.

Other areas will be found to have only a few points out which would correct easily with the above handlings. These will probably be areas where some production is occurring.

Where personnel have a concept of what order is and why it is important, they will usually be eager to correct the points of disorder that have turned up on the investigation and may need no further urging, drilling or correction, but will quickly set about remedying outpoints. For many bright and willing staff members just reading this policy will be enough to get them to straighten out their areas right away.

There is, however, a sector which has no concept of order and may not have the slightest notion of why anyone would bother with it. You will most likely find them in apathy, overwhelm or despair with regard to their post areas. No matter what they do they simply cannot get their products out in adequate quantity and quality. They try and try and try but everything seems to be working against them.

When you find such a situation, know that the area is in Confusion. You are trying to handle an area which is in a confirmed, dedicated condition of Confusion.

Such an area or individual would require the application of the Expanded Confusion Formula (HCO PL 9 Feb. 74R) including the handlings above. So if these things confirm in an area, you must use the Expanded Confusion Formula and the handlings given above to full completion. Because, frankly, such an area or individual *is* in a condition of Confusion and will remain in Confusion until the Expanded Confusion Formula, including the full handlings from the inspection, are applied.

Once out of Confusion the person would have to be brought up through the rest of the conditions.

CAUTION

The condition of Confusion is a very low condition and should never be assigned where it is not warranted. Where one or two points on the above inspection were found to be out in an area, and where these corrected easily, there would be no purpose in assigning Confusion to that area. In fact, it may worsen an area to assign an incorrect condition.

But where you have a long-term situation of no or few products combined with a state of disorder, know that the area or individual is in a condition of Confusion and that the application of the Confusion Formula plus the handlings given in this PL will bring the area out of the muck and up to square one where it can *begin* producing.

NOTE: If the inspection is done on a person or area and some of the points are found to be out and handlings are done but no condition of Confusion is assigned, the area must be reinspected about a week later. This way you will detect if an actual condition of Confusion was missed, as the area will have lapsed back into disorderliness or will have worsened.

SUMMARY

A knowledge of the basics of an area and having orderliness in an area are essential to production.

When you find a fellow who is a light-year away from the basics and doesn't have a clue on the subject of order and he's flying way up in the sky someplace instead of just trying to put together what he's supposed to put together or do what he's supposed to do, you've got your finger on his Why for no production.

With the inspection and handlings given in this policy, we can now handle any degree of disorderliness and disorganization.

And order will reign.

Nonproductive areas become capable of producing.

Already producing areas increase their production.

And production will roll.

(*NOTE:* I realize that management units, orgs and staffs are daily pounded with false economic data. The real facts of life collide with much false data. Such crippling data comes from many sources — school, advertisers, government, bankers, propagandists, even parents who insisted Johnny be a doctor so he could "live well" or set a horrible example themselves. Many have had a hand in messing up people's wits on the subject. It is a factor in inhibiting the individual prosperity of executives, staff members and orgs. Where an area is not prospering, this PL should be star-rated on its people and the false data they have on this subject stripped so that they then can prosper as they should.)

"Standard of Living" can be defined as the relative quality of a person's or group's possessions, quarters, food, equipment, tools and conditions of their area of work and existence. It is the state of the person's living, including working, environment. Where its potential continuance exists it is related to survival. It is a basic natural economic law that personal production of VFPs and one's standard of living are intimately related.

This applies to the individual as well as the team.

Where violations occur, inequities exist.

At a personal level one must produce in excess of his standard of living just to retain and maintain it.

Actually the "excess" means that because of overload, taxes, services, plant, utilities, raw materials, machine and other costs additional to his own work sphere, a person cannot expect to get the full value of his VFPs all to himself. That is not economically feasible. The "excess" varies from post to post and job to job but is never less than 5x minimum. In industry it is considered to be at least 10x to maintain company standards and solvency. The "excess" can be very high indeed in some industries. But in any case any idea that it should be one-for-one is fatal. People who know little of economics or management sometimes propose a worker should get the full value of his VFPs — but all work and all VFPs require support services and to neglect these would quickly bring on poverty. Even when working for oneself alone these "excess" factors exist and seldom drop below 5x as one still requires support services. Corrected gross income divided by staff has to be at least 5x the cost of the standard of living of the individual staff member for that standard to be barely maintained. This does not mean staff pay should be 1/5 of that figure. It means that all the things (pay included) that go into maintaining their welfare and work environment would have to be covered by 1/5 of that figure. A fairly efficient and prosperous org with a hatted, industrious, gung-ho staff can very easily maintain quite acceptable standards at 1/10 that figure. The actual cash value of every piece of work done by a person can actually be calculated. It is intricate and tricky to do and much subject to over- and underestimation but it can be done. It is not vital to do this but one might just be curious about it. If so, do it for yourself. Thus VFPs can be priced against what they bring in as part of the overall scene even when they seem indirect. All the above figures are very rough and subject to variation but this gives you some idea of what is meant by "excess" in that law.

Where a number of people in a group or on a team do not produce VFPs in excess of their standard of living, they depress the standard of living of the group or team.

Where some in a group do not only not produce VFPs but produce overt products, they actively depress the standard of living of everyone in that group or on that team.

Many economists and theorists seek to avoid that law. They do it to gratify politicians or aggrandize some false philosophy whose true purpose is suppression under other colors. But the law remains and its violation breeds an epidemic of economic ills. Amongst such ills are inflation, superbureaucracy, chaos with the marketplace and a decay of the civilization.

When a whole society demands a high standard of living and yet doesn't concentrate on the personal production of VFPs, it is finished.

Products are the basis of a standard of living. They don't appear from midair. They come from work truly done. Not from hope or false data.

It is a druggie's dream that machines, computers, under the dictatorship will do it all. Machines can raise a standard of living by assisting in production. But they can't do man's living for him. Intelligently designed and used they permit, within limits, increases in population. But machines are just tools. They have to be thought up, designed, built, run and serviced and their raw materials and fuel have to be found and delivered and their products promoted, delivered, used and often in their turn serviced. The machine age was actually recognized as failed when world leaders first began to urge population reduction on the planet to "improve the individual standard

of living." If machines were going to solve it all, why is the civilization now in such a steep decline? It took producing men *working* in and with a machine age to make the society go. Not idle mobs on welfare expecting a high standard of living while a few guys work their guts out. Pie in the sky is nice but did anyone ever get to eat it? This misinterpretation of the machine age was a heavy violation of the above economic law. But the real harm of the machine age was creating a false belief that one did not have to produce much to survive. This lowered people's estimate of how much they would themselves have to produce to survive, much less have a high standard of living. Factually one normally has to work fast and expertly and in high volume to bring about any acceptable standard of living for himself and his group. This is a point the machine age obscures. But it remains vividly and demonstrably true.

An executive who works hard yet wonders about his own low standard of living should look over his people to find those who are not producing VFPs or who produce even overt products while yet demanding a living. *They* are absorbing the potential raised standard of living of the group.

Where a group has a very low standard of living, it need only review the above law and its potential violations to understand why.

One cannot, in fact must not, increase the standard of living of a group in ways that violate the above law. It will eventually bring calamity on that group.

In a society led astray by crackpot economics, violations of the above law create a vast number of wrong examples. The rich (most of whom work like mad) are seen as idle or even criminals. The best way of life is made to appear to be idleness. One seems to be owed a living without any effort on his own part. The producing worker should be fined by higher taxation. These are not seen to be simply false data spread about to wreck the place but are held as "truths." And in their wake comes a funeral for that group or society.

There is even an economic theory spread about today called "equalitarianism." It declares everyone should get the same pay and have the same standard of living. It does not mention that anyone should do any work. It holds that the better worker should not be better rewarded. It would crash any society.

Then there is the "monetarist" who believes you can manipulate a whole society with money alone. And no thought of any production. His answer to production? (You won't believe this.) Decrease demand! In other words, reduce everyone's standard of living!

Basic economics eventually catches up with all these weird false pretenses. It may take time but, as in the law of gravity, the apple eventually falls. No matter how many crackpots advance theories to say it can't fall, will go up or vanish. Real basic economic laws are like that. They catch up. So don't wonder about inflation and depression and decayed civilizations. Basic economics caught up with the crackpots.

An executive has to pay attention to the basic law about a standard of living. If he doesn't pay close attention to it, the standard of living of himself and of his group will cave in.

INDEX

He can be "a good fellow" and seek popularity by attempting to raise the standard above what is earned. He and his group will crash.

He can be foolish and seek to raise his own rewards above what he personally is earning in terms of VFPs. But both he and his group will fail.

He can ignore the real producers of the group and not see that their standard of living is comparable to their individual production. And he and the group will fail.

He can ignore the nonproducers and the overt product makers and, by so ignoring them, tear his own and the group's standard of living to bits.

He can listen to a bunch of PR from a staff member about how valuable that staff member is and surrender to it without ever really counting up the real VFPs that staff member is not producing (or even preventing). (It happens.) Only real VFPs count.

He can work himself half to death without demanding production from others and have his own standard of living crash.

There are swarms of false data flying about today on this subject. It is taught in schools, the very best schools; it is heard on the radio and seen on TV and in the papers. The civilization, as it caves in, is blinded by literally thousands of false ideas about what and how a standard of living occurs. These, where they conflict with the basic law, actively prevent one from prospering as they blind him to the truth of his scene.

In an org or management unit in Scientology, the real VFP is valuable fine people who produce valuable final products who then make up a valuable fine public. Every piece of work and duty in a management unit or an org contributes to that.

The standard of living of an executive, a management unit, an org or a staff member is determined by that one basic economic law: The personal production of VFPs for the group and one's standard of living are intimately related.

ORG SERIES 42

ORGANIZATIONAL BASICS

An organization consists of coordinated purposes, lines and terminals. That is *all* it consists of.

To be viable, it must have a fair and valuable exchange with an area outside its perimeter in a volume adequate to its needs.

To expand, it must strengthen its purposes and increase its lines and terminals and multiply its exchange above the rate of its consumption.

When you have understood this fully you will understand all groups, companies, societies, civilizations, countries and empires.

Such rise or fall in direct relationship to how well they meet or fail to meet the first three paragraphs above.

And when you fully grasp the basic definition of organization and are trying to build, make viable and expand one, you will be very hard on anyone who is discoordinating or blunting the purposes, damaging or omitting the lines and is disestablishing the terminals. You will understand exactly what that person is doing. He is seeking to make the organization less viable and trying to contract and destroy it. So know your enemies.

And when you see somebody trying hard to build your organization up by following the first three paragraphs, you will know he is your friend and help him all you can.

It is very well to clear off all confusions by doing the first three paragraphs in clay. Then you will have, if you master it, many things clarified. And you can not only understand what makes a slum a slum, a good society a good one, why one area is poor and another opulent, you will also have acquired the potential of creating or helping to create a far better life for all.

HCO PL	3 Sept. 82	Finance Series 27 DEPUTY FBO FOR MARKETING OF ORG RESOURCES FOR EXCHANGE (D/FBO FOR MORE) PURPOSE

(NOTE: The pilot for this post has been long and successful: it is the FCCI PO [Flag Case, Course, Internship Product Officer] whose duties were covered by the famous Bulldozer EDs issued on Flag. However, the FCCI PO also covers the post of what is now called D/FBO for MORE [D/FBO for Marketing of Org Resources for Exchange]. Without this post effectively manned, the FSO — Flag Service Org — collapses and any sag in its stats is instantly traced to the nonfunctioning of the FCCI PO post. The post once functioned well in the Office of the Staff Captain and has functioned less well in the Office of the CO FSO. Therefore, the D/CO [or D/ED] for Delivery and Exchange post is put in close liaison with the strong and powerful International Finance Office Network, while remaining under the authority of the CO or ED of the org.)

The Service Product Officer in any org should have D/CO or D/ED status.

His key function is to see that the org operates at the highest level of exchange. (Ref: HCO PL 10 Sept. 82, Finance Series 28, EXCHANGE, ORG INCOME AND STAFF PAY)

Therefore, his post is now retitled D/CO (or D/ED) for Delivery and Exchange and he is located in the Office of the CO/ED, Department 19, of all Class IV and Sea Org orgs.

He is the bridge between the D/FBO for MORE and the FBO.

This creates a flow:

You have the D/FBO whipping up business by seeing that the public is made aware of the org's products and services, and driving more business down on the org than it can waste.

The D/CO (or D/ED) for Delivery and Exchange makes sure this public gets SIGNED UP and SERVICED. He is a product officer who names, wants and gets promotion, sales, call-in, delivery itself and re-sign occurring.

The FBO, then, sees to the org's solvency by ensuring income is greater than outgo, that production is properly financed, that staff are well paid for their production and that Flag is recompensed for good management of the org. And all of this makes it possible for the org to then expand and deliver in greater volume.

The flow goes from public (D/FBO) to ⟶ the whole sign-up and service line (D/CO or D/ED for Delivery and Exchange) to ⟶ solvency and volume (FBO).

It is this incredibly workable lineup that takes an org stably up the conditions of exchange. (Ref: HCO PL 10 Sept. 82, Finance Series 28, EXCHANGE, ORG INCOME AND STAFF PAY)

But the line breaks down where there is no D/CO or D/ED for Delivery and Exchange posted. And where it breaks down most specifically and ruinously is in the area of CALL–IN.

If one wants call-in to occur and the org's exchange with its public kept in, the only way to do it and also expand the org is to get a D/CO or D/ED for Delivery and Exchange on post and functioning.

Public interest may be kindled, public reach may be occurring, public may be paying partially or in full for goods or services, but if goods and services aren't being delivered in full the flow is broken and the org is in a condition of only partial exchange. Delivery in full means calling in the person so the service CAN be delivered. In this way the org maintains "fair exchange" with each and every public on its lines.

So the answer for any org that is sitting in a condition of only partial exchange, or an org that is ANYWHERE below the fourth condition of exchange — exchange in abundance — is to immediately, at once and yesterday, and without ripping off some vital post, post a D/CO or D/ED for Delivery and Exchange.

The first and primary function of the D/CO (or D/ED) for Delivery and Exchange is CALL–IN and this means he personally gets call-in done all by his little lonesome. With his own hands and voice he himself begins to call in fully and partially paids. Call-in is his first duty and when he's got that going he posts a Call-in Officer to take over the hat which he has already begun and he then expands onto the other functions of his D/CO or D/ED for Delivery and Exchange post, as covered in HCO PL 9 Aug. 79R II,

SERVICE PRODUCT OFFICER. But he FIRST and PERSONALLY and BY HIMSELF gets call-in going and exchange occurring at once.

What is involved here is the administrative principle that in order to get something done that is an expanding function you give it to somebody and tell him to expand it.

A CO or ED, whose responsibility it is to see that the main functions of the org are getting done, also wears the planning and coordination hat for the whole of the org's activity. If he's going to get the show on the road he needs to delegate some of this responsibility. He needs a deputy — the Deputy CO (or D/ED) for Delivery and Exchange — and that deputy needs the authority and the clout to see that, through promotion, sales, call-in, delivery and re-sign, the main products of the org do get produced.

Getting this post filled competently enables the ED to fully wear his planning and coordination hat and makes it possible for the flow from D/FBO to D/CO (or D/ED) for Delivery and Exchange to FBO to occur.

As some orgs in recent times have experienced both external and internal suppression on the subject of calling people in and servicing them, the D/CO (or D/ED) for Delivery and Exchange is given the additional powers of immediate communication to the International Finance Office and the Inspector General Network without vias to report and get help to remedy internal and external situations in orgs which suppressively inhibit call-in, delivery or expansion whether by inattention, refusals to post vital posts, failures or refusals to contact or call in interested persons, theft of org prospects or business or outright rip-offs to the end of ensuring successful execution of his duties and the expansion of the org. A form for such a report will be provided but absence of a form or a supply of such forms must not inhibit such reports.

This IS the winning combination by which an org moves up to "fair exchange" with all of its public and from there up to the highest level of exchange.

And it is the highest level of exchange toward which the whole activity of the D/CO or D/ED for Delivery and Exchange is geared — exchange in abundance!

"DOING A QUICKSILVER" FORBIDDEN

Refs:

HCO PL	19 Mar. 71 I	Personnel Series 20 PERSONNEL PREDICTION
HCO PL	24 June 70 II	PERSONNEL POOLS
HCO PL	7 Jan. 66 I	LEAVING POST, WRITING YOUR HAT
HCO PL	20 Apr. 69 II	HATS, NOT WEARING

HCO PL	11 Aug. 71 II	Personnel Series 22 DON'T UNMOCK A WORKING INSTALLATION
HCO PL	7 Mar. 65 III	OFFENSES AND PENALTIES
HCO PL	13 July 74 II	Org Series 34 WORKING INSTALLATIONS

There is a condition that can exist in orgs which differs slightly from "musical chairs" (the rapid transfer of personnel from post to post) but is akin to that and every bit as deadly.

We could call it a "quicksilver personnel" scene.

("Quicksilver" is another name for mercury, the silvery-white metallic element, liquid at room temperature, which is used in thermometers, barometers and similar instruments.)

Used figuratively, the term "quicksilver" means something that is quick-moving, unpredictable and as elusive as mercury, or "mercurial." Something that is mercurial is changeable, variable, volatile.

To anyone who has ever observed a drop of quicksilver, or mercury, in an open container or placed on a slab of glass, this will be real. One second it's here, the next second it's there. Just about all you have to do is breathe on it and it changes its position. And where it *was* a second ago there's now nothing.

It is miserable (if not impossible) for an executive or management body trying to run things with staff doing a quicksilver. One can hit up against some nasty surprises.

For example, an org's personnel scene may look great on the board, with posts filled, hats existing and known, production occurring and on the rise — all is looking good when suddenly the stats crash.

An initial check may show there haven't honestly been any post transfers, per se. But dig a bit further and you're likely to find a quicksilver personnel scene. The top delivery auditor is off on a two-week vacation. The Qual Sec has been fired on a recruitment tour. The Reg has gone out-ethics and been suspended, unreplaced, pending some ethics handling. The Chief Officer is off on maternity leave and the CO, holding her post from above, is being the guest speaker at an event in the next city.

It happens and it happens not only in Class IV orgs but in the higher service orgs and management units where tours are essential and missions need to be fired and other situations can crop up requiring personnel.

It has shown up drastically at times in several large orgs. In one, the head of a vital network went off on mission and, with no one left being the senior, the stats in the area crashed. In another, the sales manager took his leave, his routine functions were ignored and sales suffered severely. And in still another org, no less than *six* key delivery terminals were all found to be out on regging tours in one week, some of them over a period of several weeks, at a time when delivery of paid-in-full services was backlogged!

None of these terminals had been removed or transferred or promoted. And one could say the actions being done are all covered in some way in policy, are needed, and therefore justified. But these terminals were all off post unreplaced, weren't they?

That's a quicksilver personnel scene. It's unstable.

CONTRIBUTING FACTORS

Executives who issue orders that unmock working installations where production is occurring at "A" to get something done at "X" bring about such scenes.

Personnel who, like quicksilver, accommodatingly move off their assigned posts unreplaced to do something else at the first invitation or order, help to generate and sustain such scenes.

Seniors who permit or condone this are also a party to them.

Personnel can do a quicksilver for any of a number of reasons. For some, the chance to go off and see other people and new places may be an alluring prospect. Some are too timid to refuse a destructive order and so they comply, under protest. For others there is financial gain involved — there are often commissions or a bonus at stake.

Tours have been used by some, apparently condoned by executives, to take longer leaves (more time off on leave per year) by combining 4 to 6 or even 8 weeks of a "regging tour" with a "leave," with the org paying both the person's fare and living expenses and no clear distinction made between the period of "tour" and the period of

the "leave." (While this is part of an unstable personnel scene, it is also a situation requiring a separate ethics handling in itself.)

Sometimes a staff member is made to feel, by a very convincing exec, that the action which calls for his suddenly going off post with no or inadequate replacement is actually more important than his job. Where this threatens production and there is no adequate replacement, this is almost always a falsehood.

It is true that missions need to be fired. Tours are vital to income and delivery. Staff sometimes do need to go off post temporarily for handling of one type or another. Events are valuable in terms of promotion, goodwill, PR and sign-ups, and for certain types of these, key personnel or trained tech delivery personnel may be required. Emergencies do arise. Personnel are entitled to annual leave. And speed of operations is important.

On the plus side, we do have capable and versatile staff who are willing to extend themselves, when needed, to make things go right. We have demanding, fire-breathing executives who are out to handle situations and open up new fields for delivery which, in itself, is a good thing. And many of these go about it standardly.

But the senior or exec at any level who endangers ongoing delivery and production and/or unstabilizes a producing personnel scene to get these things done is simply advertising to one and all that he can't predict and plan and organize or get others to do so. Control is lacking here as well as just plain common sense. The kindest thing one could say about such an exec is that he is shortsighted. And "quicksilver" is a rather mild term for the staff member who steps so easily off his post and leaves a hole in the lineup with no thought of the consequences.

One could say that everyone has personnel problems. BUT that is no Why.

HANDLING "QUICKSILVER PERSONNEL" SCENES

The first policies *missing in application* are those covering replacements and hat turnovers.

BECAUSE IT IS A "*TEMPORARY*" ABSENCE, NO ONE IS DEMANDING REPLACEMENT AND TURNING THE HAT OVER TO SOMEONE WHO CAN COVER THE POST *COMPETENTLY*.

But policies exist in abundance on this subject. HCO PL 29 Aug. 70 I, Personnel Series 1, PERSONNEL TRANSFERS CAN DESTROY AN ORG, points up the outnesses which can destroy an org faster than any others. HCO PL 7 Jan. 66 I, LEAVING POST, WRITING YOUR HAT, covers the staff member's responsibility for a post he is vacating under *any* circumstances. HCO PL 20 Apr. 69 II, HATS, NOT WEARING, emphasizes the staff member's responsibility for knowing that he *is* the Qual Sec, or Reg, or the post title for the post and functions he has accepted. HCO PL 11 Aug. 71 II, Personnel Series 22, DON'T UNMOCK A WORKING INSTALLATION, cites the main reason we have ever had slumps in orgs.

The personnel policies are there. But very often, where a "quicksilver personnel" scene is permitted, BECAUSE SOMEONE PULLS OFF A SUCCESS IN ONE AREA, EVEN THOUGH STATS IN HIS OWN AREA MAY CRASH, THE EXISTING ETHICS

POLICIES THAT COVER SUCH A CRASH OR THE COLLAPSE OF AN AREA MAY BE OVERLOOKED OR DELIBERATELY IGNORED.

So how do we handle "quicksilver personnel" scenes?

The answer is to add some teeth to the existing policies:

1. AN ABSENCE FROM POST FOR EVEN A TEMPORARY PERIOD OF AS LITTLE AS HALF A WEEK IS AN ETHICS OFFENSE, UNLESS SOMEONE IS NAMED AND THERE AS A REPLACEMENT WHO HAS HAD THE POST PROPERLY TURNED OVER TO HIM AND WHO CAN COVER THE POST *COMPETENTLY*.

2. IF SUCH ABSENCE WITHOUT COMPETENT REPLACEMENT OCCURS *AT ALL,* AN IMMEDIATE COURT OF ETHICS MUST BE CALLED ON THE STAFF MEMBER WHO LEAVES HIS POST UNFILLED OR INADEQUATELY COVERED, AS WELL AS ON THE SENIOR OR EXECUTIVE ORDERING, CONDONING OR PERMITTING IT.

3. IF IT OCCURS AND RESULTS IN STATS CRASHING IN A COURSE, A DIVISION, DEPARTMENT, SECTION, UNIT, AREA, ZONE OR ORG, A COMMITTEE OF EVIDENCE MUST BE CALLED WITH *ALL* INVOLVED NAMED AS INTERESTED PARTIES.

The charges are:

CONDONING OR CONTRIBUTING TO CIRCUMSTANCES OR OFFENSES CAPABLE OF BRINGING A COURSE, SECTION, UNIT, DEPARTMENT, ORG, ZONE OR DIVISION TO A STATE OF COLLAPSE

and

NEGLECT OF RESPONSIBILITIES RESULTING IN A CATASTROPHE EVEN WHEN ANOTHER MANAGES TO AVERT THE FINAL CONSEQUENCES.

With this policy made known and enforced, there *is* a cure for those who do a "quicksilver" and for executives and seniors whose out-planning and out-prediction bring about quicksilver personnel scenes.

THE TOOLS OF MANAGEMENT

Refs:

HCO PL	11 Apr. 70 I	THIRD DYNAMIC TECH
HCO PL	28 July 72	Exec Series 16 Org Series 32 Esto Series 26 ESTABLISHING, HOLDING THE FORM OF THE ORG
HCO PL	1 July 82	AKH Series 41 MANAGEMENT COORDINATION

There is a simplicity to managing effectively. It begins with the basics of management.

Although it may appear so to some, successful management is not a highly complicated, esoteric activity. But, just as an auditor or a C/S must know and be able to use the exact tools of first dynamic tech in handling cases in order to achieve exact and standard results on a one-for-one basis, so must an executive or manager know and be able to use the exact tools of third dynamic tech in handling groups to achieve successful and exact results in every instance.

Within the wealth of data on third dynamic tech contained in HCO Policy Letters, the OEC Volumes and recorded LRH lectures and books on the subject, there are certain definite, specific *tools* a manager uses. These are the tools of management.

The difference between brilliant management and mediocre or no management, at any level, lies in:

1. Knowing what the *tools* of management are, and

2. Knowing how to use them.

Many people are not aware that, like a carpenter or any other workman, a manager uses specific and exact *tools*. Thus, we see people here and there who are doing the equivalent of using the handle of a chisel to drive nails into wet concrete.

It is a common fault with inexpert workmen to find them using their tools wrongly or not using them at all. They make a breakthrough when they discover what the specific tools are for.

One can see this in people who can't mix sound or can't become mixing engineers. They sit with all these knobs in front of them, reach out and grab this knob or that one, hoping hopefully something will happen to the sound. Yet every component they have in front of them is an exact tool to do an exact thing with sound!

There are a lot of comparisons one could make, but the point is that people in management positions have precise *tools* available to them in Dianetics and Scientology which happen to be far better tools than have ever been available on the planet.

One can have very good people on management posts who still can drown if they don't know and put to use the management tools.

But without these being specified as exact tools, one might not see the simplicity of it.

MANAGEMENT ECHELONS

Operating as it does into an expanding scene, Scientology has grown into the need for and use of various echelons of management.

In orgs, for some time we have had division heads and above them we have the Executive Council, headed by the CO or ED of the org.

Above the level of service orgs we have middle management and still above that we have the Senior Executive Strata of management. And each of these echelons must know the tools of management and how to use them.

The OEC (Org Executive Course) and the FEBC (Flag Executive Briefing Course) have long been established as the essential courses for training executives at service org level and above.

These courses, and the OEC and Management Series Volumes upon which they are based, teach the form of the org and how to use the parts and posts and functions that go to make up the whole. They give us executives who know how to correctly utilize staff and their assigned posts and duties. We call it "knowing how to play the piano" — it's a matter of knowing what key to hit when and which keys to use in combination to produce a desired result. (Ref: HCO PL 28 July 72, ESTABLISHING, HOLDING THE FORM OF THE ORG) In other words, it's a matter of knowing and using one's tools. The OEC and FEBC courses teach this data and much, much more.

While at this writing there are numerous OEC and FEBC grads and more in the making, thousands more will be needed to handle the current rate of expansion.

Meanwhile an executive at any level and whatever his training needs to know and use his management tools NOW if he is to function at all.

A div head must "know how to play the piano" within his division.

The posts of CO or ED, Chief Officer, Supercargo, Org Exec Sec and HCO Exec Sec require executives who are capable of "playing the piano" across the divisions of the entire org and using hats and posts and functions correctly in order to achieve immediate production from the org as a whole.

At middle management one is handling not one function nor only one org but many orgs and their functions, which requires "knowing how to play the piano" at that level.

And at the Senior Executive Strata of management, we get into the vital need for "knowing how to play the piano" across a much wider sphere, using the full scope of management tools and using them with high skill. One might be using the same tools as lower stratas of management but a higher level of expertise is required as one's planning, decisions and actions are influencing far, far broader areas.

What has brought this about is the rapid expansion of Scientology into wider zones of responsibility and therefore increased responsibility with a resultant increase in traffic. This naturally has to be handled by increasing efficiency. What it has done, in effect, is push some up from lower-level management status to upper-level management status, necessarily. Without realizing it, some executives have been climbing a status stairs in terms of influence and zones of control. And they can go only so high without being terribly precise in their use of tools. After that, without this acquired precision, they drown.

The obvious answer to all of this is an executive training program which instant-hats executives on the fundamental tools of management and provides Management Status checksheets through which an executive or manager raises his status by *becoming more and more expert with these and an even wider range of tools*. And such a program has now been developed!

MANAGEMENT STATUS CHECKSHEETS

The new executive training program consists of three status levels.

These levels are to be covered in a series of Management Status checksheets.

The Management Status One checksheet has a prerequisite of Staff Status II. It *instant-hats* an exec on the basic tools of management, such as:

The Admin Scale, target policy, strategic plans, programs, specific lines and org terminals, org boards, despatches and telexes, statistics and graphs, conditions, hats and hatting, files, personnel folders, ethics folders, etc. Each one is a specific tool.

The Management Status Two checksheet (with an OEC prerequisite) consists of a profound review of the basic management tools and study of the upper-level tools of management, which include:

Surveys, PR, pilots, review of past performance, general economics, finance systems, cost accounting, control through networks, admin indicators, morale, legal, goodwill, exchange, missions (Action missions), economical management and managing by dynamics.

The Management Status Three checksheet (with FEBC prerequisite) would be a more profound review of the basic *and* upper-level management tools, in addition to training on the twelve ingredients of expansion upon which the Senior Executive Strata operates.

Even an OEC or FEBC grad would do the Management Status checksheets as, when he comes out of an OEC or FEBC, all in the clouds, the Management Status checksheet is needed to bring him back down to earth and tell him he's dealing with tools which are very finite tools.

What is being communicated to executives by these checksheets is that they have tools, what the tools are exactly, and that they must use them.

EXECUTIVE STATUS LEVELS

There are specific requirements to be met by a manager to attain each of the three Executive Status levels.

Working up through these status levels, a manager not only becomes more proficient in handling an org, any org, but becomes fully certified to operate at middle or senior echelons of management.

The Executive Status levels are:

1. EXECUTIVE STATUS ONE: At this level, the person is simply thrown on post, the basic management tools are put into his hands via a brief, rat-a-tat-tat Management Status One checksheet and he gets on with it.

2. EXECUTIVE STATUS TWO: For one to be certified at this level, one must have completed the OEC, done the Management Status Two checksheet and have an adequate production record.

3. EXECUTIVE STATUS THREE: For one to be certified at this level, he must have completed the FEBC, done the Management Status Three checksheet and have a proven production record.

When the steps for Executive Status certification are complete, the exec must present adequate evidence of such to the Qualifications Division. After verification of the evidence, he is awarded the appropriate Executive Status certificate.

By use of these Executive Status levels, executives at management levels could see what executives they had (or not had). The designation "ES I" (Executive Status I) would tell them at once what they were dealing with, etc. Also, from the viewpoint of the individual, he would know where he had to go to get an upper-level rating.

Once these Management Status checksheets are issued, middle and central management personnel should not draw full pay or be bonus eligible until they have completed the Management Status One checksheet, as they will not be operating effectively until they have done this.

EXECUTIVE STATUSES AND STAFF STATUSES

The Exec Status levels do not replace Staff Status training. All staff and execs are programed and move up the Staff Statuses so as to have a better idea of the org as an org; these levels are also indicative of the training and experience of a staff member and show his promotion eligibility.

An executive should attain Executive Status One by completing the Management Status One checksheet as soon as possible upon assuming post, so he has the management tools available for his immediate application.

Once an exec attains Staff Status VI (Org Exec Course graduate), he can attain Executive Status Two by fulfillment of the requirements listed above. An FEBC graduate achieves Executive Status Three in a similar fashion.

SUMMARY

With the release of the new Management Status checksheets, precise and gradient training levels for all echelons of management will exist comparable to the precise and gradient training levels required for all echelons of technical delivery.

Quite an unbeatable combination!

One winds up with managers fully familiar with their exact tools, having the one-two-three of management tech at their fingertips, and "knowing how to play the piano" effectively across an org, a continent, a planet!

So the answer to current expansion is an action which is geared to bring about even further expansion. And that is the only way to go!

It begins with the basic tools of management.

		MANAGEMENT TOOLS BREAKTHROUGH

The following is a list of the materials which, out of the many tools of management, comprise the BASIC MANAGEMENT TOOLS.

1. *ADMIN SCALE:* A scale for use which gives a sequence (and relative seniority) of subjects relating to organization. The scale, from the top down, includes: Goals, Purposes, Policy, Plans, Programs, Projects, Orders, Ideal Scenes, Statistics, Valuable Final Products. The scale is worked up and down until it is (each item) in full agreement with the remaining items. In short, for success, all these items in the scale must agree with all other items in the scale on the same subject.

2. *TARGET POLICY:* A series of policy letters which describe each type of target and how they are to be used by staff, executives and management personnel to get something *done.*

3. *STRATEGIC PLANS:* A STRATEGIC PLAN is a statement of the intended plans for accomplishing a broad objective and inherent in its definition is the idea of clever use of resources or maneuvers for outwitting the enemy or overcoming existing obstacles to win the objective. It is the central strategy worked out at the top which, like an umbrella, covers the activities of the echelons below it.

4. *PROGRAMS:* A PROGRAM is a series of steps in sequence to carry out a plan. Programs are made up of all types of targets coordinated and executed on time.

5. *PROJECTS:* A PROJECT is a series of guiding steps written in sequence to carry out one step of a program, which, if followed, will result in a full and successful accomplishment of the program target.

6. *ORDERS:* An ORDER is the direction or command issued by an authorized person to a person or group within the sphere of the authorized person's authority. It is the verbal or written direction from a lower or designated authority to carry out a program step or apply the general policy. Some program steps are so simple that they are themselves an order or an order can simply be a roughly written project. By implication an order goes from a senior to juniors.

   All orders of whatever kind by telex, despatch or mission orders must be coordinated with current written command intention. You can destroy an org by issuing orders to it uncleared and uncoordinated. Coordinate your orders! Clear your orders!

7. *COMPLIANCE REPORTS:* A COMPLIANCE REPORT is a report to the originator of an order that the order has been done and is a completed cycle. It is not a cycle begun, it is not a cycle in progress, it is a cycle completed and reported back to the originator as done.

   When an executive or manager accepts "done" as the single statement and calls it a compliance, noncompliance can occur unseen. Therefore, one must (1) require explicit compliance to every order and (2) receive the evidence of the compliance pinned to the compliance report. Such evidence might be in the form of copies of the actual material required by the order and procured, or photographs of it, ticket stubs, receipts, a signed note stating the time and place some action was carried out, etc. Evidence is data that records a "done" so somebody else can know it is done.

   It is up to LRH Comms, Flag Reps or execs to verify reports of dones or get dones done. True compliances to evaluated programs are vital.

8. *TERMINALS:* A TERMINAL is something that has mass and meaning which originates, receives, relays and changes particles on a flow line. A post or terminal is an assigned area of responsibility and action which is supervised in part by an executive.

   A fixed-terminal post stays in one spot, handles specific duties and receives communications, handles them and sends them on their way.

   A line post has to do with organizational lines, seeing that the lines run smoothly, ironing out any ridges in the lines, keeping particles flowing smoothly from one post to another post. A line post is concerned with the flow of lines, not necessarily with the fixed-terminal posts at the end of the lines.

9. *LINES:* A LINE is a route along which a particle travels between one terminal and the next in an organization; a fixed pattern of terminals who originate and receive or receive and relay orders, information or other particles.

A COMMAND LINE is a line on which authority flows. It is vertical. A command line is used upward for unusual permission or authorizations or information or important actions or compliances. Downward it is used for orders.

A COMMUNICATION LINE is the line on which particles flow; any sequence through which a message of any character may go. It is horizontal.

The most important things in an organization are its lines and terminals. Without these in, in an exact known pattern, the organization cannot function at all. The lines will flow if they are all in and people wear their hats.

10. *ORG BOARDS:* An ORG BOARD (ORGANIZING BOARD) is a board which displays the functions, duties, sequences of action and authorities of an organization. The org board shows the pattern of organizing to obtain a product. It is the pattern of the terminals and their flows. We see these terminals as "posts" or positions. Each of these is a hat. There is a flow along these hats. The result of the whole org board is a product. The product of each hat on the board adds up to the total product.

11. *HATS:* HAT is a term to describe the write-ups, checksheets and packs that outline the purposes, know-how and duties of a post. It exists in folders and packs and is trained in on the person on the post to a point of full application of the data therein. A HAT designates what terminal in the organization is represented and what the terminal handles and what flows the terminal directs. HATTING is the action of training the person on the checksheet and pack of materials for his post.

12. *TELEXES:* A TELEX is a message sent and received by means of telex machines at specific stations hooked up with one another. This is a fast method of communication, similar to a telegram or cable.

    Use telexes as though you were sending telegrams. Positiveness and speed are the primary factors. Cost enters as a third. Security enters as a fourth consideration. All have importance but in that order.

    Telexes must be of such clarity that any other person in the org can read and understand them. You must take responsibility for both ends of a communication line. Write your communication (telex) so that it invites compliance or answer without further query or dev-t. Entheta in telexes on a long-distance comm line is forbidden.

    Don't use telexes when despatches will do. Nonurgent communications on telex lines jam them. Do NOT put logistics (supply) on a telex line. Telex lines should only be used for communications concerning operations.

13. *DESPATCHES:* A DESPATCH is a written message, particularly an official communication. When writing a despatch, address it to the POST — not the person. Date your despatch. Route to the hat only, give its department, section and org. Put any vias at the top of the despatch. Indicate with an arrow the first destination. Sign it with your name but also the hat you're wearing when you write it.

As with telexes, despatches must be written so clearly that any other person in the org can read and understand them, with the originator taking responsibility for both ends of the communication line. And, as with telexes, entheta in despatches on a long-distance comm line is forbidden.

14. *STATISTICS:* A STATISTIC is a number or amount *compared* to an earlier number or amount of the same thing. STATISTICS refer to the quantity of work done or the value of it in money. Statistics are the only sound measure of any production or any job or any activity. These tell of production. They measure what is done. Thus, one can manage by statistics. When one is managing by statistics they must be studied and judged alongside the other related statistics.

15. *GRAPHS:* A GRAPH is a line or diagram showing how one quantity depends on, compares with or changes another. It is any pictorial device used to display numerical relationships.

16. *CONDITIONS:* A CONDITION is an operating state. Organizationally, it's an operating state and oddly enough, in the MEST universe, there are several formulas connected with these operating states. The table of conditions, from the bottom up, includes: Confusion, Treason, Enemy, Doubt, Liability, Non-Existence, Danger, Emergency, Normal, Affluence and Power or Power Change. There is a law that holds true in this universe whereby if one does not correctly designate the condition he is in and apply its formula to his activities or if he assigns and applies the wrong condition, then the following happens: He will inevitably drop one condition below the condition he is *actually* in. One has to *do* the steps of a condition formula in order to improve one's condition.

17. *PERSONNEL FOLDERS:* A PERSONNEL FOLDER is kept in HCO for each person employed by the org. The folder is to contain all pertinent personnel data about the person: name, age, nationality, date employment started, address (if other than the org), next of kin, social security number, test scores, previous education, skills, previous employment, case level, training level, name of post, former posts held and dates held, production record on post(s), date employment ceased, copies of all tests, and any other pertinent data.

    Copies of contracts, agreements or legal papers connected with the person are filed in the personnel folder. The originals of such papers are kept in the val doc files.

    A personnel folder is used for purposes of promotion and any needful reorganization and so should contain anything that throws light on the efficiency, inefficiency or character of personnel.

    Personnel folders are filed by division and department in HCO, with the personnel in separate folders filed alphabetically in their department. There should be two sections in the personnel files: (1) present employees and (2) past employees.

18. *ETHICS FOLDERS:* An ETHICS FOLDER is kept in HCO for each individual staff member. It is a folder which should include his complete ethics record, ethics chits, Knowledge Reports, commendations and copies, as well, of any

justice actions taken on the person, such as Courts of Ethics or Comm Evs, with their results.

Filing is the real trick of Ethics work. The files do 90 percent of the work. Ethics reports patiently filed in folders, one for each staff member, eventually makes one file fat. When one file gets fat, call up a Court of Ethics on the person and his area gets smooth.

19. *FILES:* A FILE by definition is an orderly and complete deposit of data which is available for immediate use. As FILES are the vital operational line it is of the GREATEST IMPORTANCE that ALL FILING IS ACCURATE. A misfiled particle can be lost forever. A missing item can throw out a whole evaluation or a sale. It is of vital interest both in ease of work and financially that all files are straight.

20. *DATA SERIES:* The tool to discover causes. The administrative technology described in these policy letters is applied to find what is logical by ferreting out what is illogical, using this to reveal the greatest outness which, when remedied, will resolve the scene.

There is considerably more data on each of these tools contained in the policy letters in the OEC Volumes and Management Series Volumes, *none* of it complicated or difficult to grasp.

The purpose of this policy letter is simply to advise the exec that these *are* his tools — his most fundamental and basic management tools. And that they are for USE and it is VITAL that he USE them.

Why? Because use of these simple, basic tools means the difference between a failing org and a flourishing one.

And we want organizations to flourish!

		THE TOOLS OF MANAGEMENT
HCO PL	31 July 83 I	AKH Series 48
		Exec Series 26
		Org Series 46
		Esto Series 47
		BASIC MANAGEMENT TOOLS

THE FIRST THING AN EXECUTIVE OR MANAGER AT ANY LEVEL NEEDS TO KNOW IS THAT HE HAS *TOOLS* WITH WHICH TO MANAGE.

This applies to top levels of management, to middle management echelons and in every org from the CO or ED down through the Exec Council and every head of a division or department.

BREAKTHROUGH

This datum is the result of a recent, eye-opening breakthrough.

The breakthrough was not a matter of discovering or developing or improving the materials which make up the tools of management. Org boards, the Admin Scale, target policy, planning and programing, statistics, graphs and conditions (to name a few of these tools) have been a part of our technology, well defined, available for use and used for quite some years now.

THE BREAKTHROUGH WAS IN DISCOVERING THAT A GREAT MANY EXECUTIVES DID NOT LOOK UPON THESE AS *TOOLS*.

NAVIGATE
FIRST PAGE
SEARCH
FIND

EXIT
CONTENTS
ORG BOARDS
INDEX

But unless one does recognize them as tools, unless one actually puts them in the *category of tools,* like rakes and shovels and wheelbarrows, he is apt to think of them as opinions or theories or something of the sort. He won't recognize that he does have actual *tools* with which to manage. And, not realizing this, he won't USE them in managing.

Such a scene could be compared to somebody building a house who didn't even know he was trying to build a house and, should this be pointed out to him, he would look at hammers and saws as if they were total strangers. He wouldn't wind up with a house.

Any activity has its tools. And if one is going to engage in an activity, he had better know what its tools are and that they are for use.

BASIC MANAGEMENT TOOLS

We are rich in management tools but the most fundamental of them, required for use at any executive level from the highest to the lowest, are these:

ADMIN SCALE

TARGET POLICY

STRATEGIC PLANS

PROGRAMS

PROJECTS

ORDERS

COMPLIANCE REPORTS

ORG TERMINALS

SPECIFIC LINES

ORG BOARDS

HATS AND HATTING

TELEXES

DESPATCHES

STATISTICS AND GRAPHS

CONDITIONS

PERSONNEL FOLDERS

ETHICS FOLDERS

FILES

DATA SERIES

Each of these fundamental tools is defined and covered briefly in HCO PL 31 July 83 I, BASIC MANAGEMENT TOOLS.

None of these are complicated. They are actually SIMPLE but VITALLY, VITALLY IMPORTANT.

One gets some terminals, gets them some lines, gets the channels of command and echelon worked out, gets in strategic planning and with that one can achieve some coordination.

But it is necessary to be able to conceive of purpose (which, in target policy, becomes objectives). And it is necessary to be able to write targets that will accomplish that objective or that purpose. To get the targets done one needs lines and terminals there. And to have lines and terminals, of course, one has to have an org board.

SIMPLE. But VITALLY IMPORTANT.

In laying out these tools we are laying out the fundamentals of organization as that, most definitely, is what these tools are. And these tools will give one an organization. Without them, you don't have an organization, you have a mob. And if one cannot figure out purpose or objectives or write targets and telexes and get hatting done and hats worn they'll just keep on being a mob. But correct use of just this basic list of management tools can turn a mob into a producing organization!

EXEC STATUS ONE CHECKSHEET

A fast, instant-hat type of checksheet called Exec Status One is being provided to swiftly train execs and managers at all levels on these tools.

This is not a substitute for an OEC or FEBC. But it is vital that an exec starts using these tools right now, instantly and at once yesterday, if he considers himself an executive or is in a position of handling an organization of any type, size or kind. Because if he doesn't use these tools, he's going to lay an egg.

ETHICS

Once the exec has passed this first checksheet, Exec Status One, it's an ethics offense to fail to use these tools properly. One would handle a first or second offense with cramming, but after that it's a Court of Ethics and, in the case of a person having trained on these tools continuing to misapply or not apply these tools, it becomes a matter for a Comm Ev.

SUMMARY

1. First, an executive or manager must know that actual TOOLS EXIST for his use in managing.

2. Second, he needs to know WHAT his tools are.

3. Third, he must realize that these tools are SIMPLE but VITALLY, VITALLY IMPORTANT, that they are for USE and he must *USE THEM*.

PRODUCT ORIENTATION

Refs:

HCO PL	14 Sept. 70 I	Org Series 2 COPE AND ORGANIZE
Tape:	7011C17 SO	FEBC 1, "Welcome to the FEBC"

One of the primary duties of a product officer is to look around and find some production to do.

On an executive post, the formula one operates on is 50 percent production and 50 percent organize. When the organize is superlative and is very well done (while remaining only 50 percent of the time spent by the executive), it eventually gets up to 75 percent production and 25 percent organize. This is approximately the ideal scene.

OVER–ORGANIZE

Organization is a vital activity. However, when the amount of organize time starts outweighing the production time, it is an indicator of other outnesses. The purpose for organizing in the first place is so that *production* can occur. In an area of organize-organize-organize, one will always find crashing Mis-Us, false data, overts and withholds. In other words, these are the things which turn people into fiddle-fiddle organize.

Organize time should not exceed 50 percent of a person's post time. Cramming and drilling fall under the category of organize, and the 50-50 rule applies here as well. The solution to a flubbing staff member is not to put him onto full-time drilling or cramming. The person should do his correction actions for half a day and be put on the job in some capacity the other half of the day so that he stays accustomed to the scene. Otherwise, the person is liable to get stiff and have trouble getting back onto post when he does finish his correction. Study, and even cramming, is actually an award. What about the guys that are doing all the work? Wouldn't they like to have a full day of cramming too?

KEEPING PRODUCTION ROLLING

It is the responsibility of the executive to keep his staff busy producing.

Many people don't like to be executives because they always have to be ransacking around making sure staff are producing, and finding things for them to do. But personnel are actually put at risk when they aren't kept in production. A big company which suddenly dismisses a lot of personnel simply has shiftless executives who have not found things for the personnel to do.

Even if major production in a particular area is temporarily stopped for some reason, other related (or different) products and subproducts can be found for the staff to do which can be done with existing resources.

As an example of this, suppose one had a movie production company whose camera was out for repair. Though they wouldn't actually be able to put anything on film, there would still be cycles which could be done in the meantime. They could be rounding up props, rehearsing actors, and making sure all the other actions which will be needed to complete that film are done.

It is not a slight matter to overlook things like this because somewhere up the track, in the midst of heavy rush production, suddenly one of these overlooked cycles will pop into view and stall the whole line while it is done on an emergency basis.

SUMMARY

The trick of the product officer is to find blank periods and things to put in them. If one gets conditioned to thinking this way, it becomes a very easy job. Otherwise, it's all panic.

Product orientation is very important, as in the long run, it protects the worker and it gets the show on the road. One can't totally produce or totally organize at any given time. It takes an average between production and organize to keep things going. But the whole point is to keep things going, and keep products rolling out.

LOST TECH

(Written on 8 Nov. 79. Issued as
an HCO PL on 21 Sept. 95.)

Modifies: HCO PL 9 May 74 PROD–ORG, ESTO AND OLDER SYSTEMS RECONCILED

I've just realized that the Esto and the prod–org system, both of which were successful in their day, have been totally dropped. One executive apparently had a confusion on the two systems and could not reconcile them and so stopped pushing both of them. That is my Why for some org failures.

The prod–org system was enormously successful and has been dropped. The Esto system had limited success and has been dropped. The reason for the failure of the Esto system was earlier isolated — the Supervisors let the Esto trainees fake their way through their study of the subject. They just didn't study the subject and then went around running into walls. This was true even though they were given heavy intensive training on it. They didn't do the training.

This comes up because of a cram done on this executive which states that he could never reconcile the two systems and has had a confusion on them. This definitely must have shown up during his tenure as an executive and it brings to mind right this minute that the prod–org system and the Esto system may never have been pushed in. This executive violated the normal actions of prod–org and org establishment. But this bares the fact that management and orgs may not be pushing either the prod–org system nor the Esto system and this could, in large measure, account for the fact that orgs in some cases became disestablished and ceased to produce and deliver.

The exact goof which this executive made is important to understand — he put the Service Product Officer over the Esto and made the Esto the org officer of the Service Product Officer, and hoped from this that his org would be established. Of course it wouldn't be established at all because a product officer's org officer normally specializes in disestablishment — org officers have tended mainly to tear up the org in

the name of production. That is by our experience. An org having an Esto, recruits up an Esto corps. That is the only thing that will get posts filled and hatted.

These two systems must be represented on any org board. The product officer must be on those org boards, the product officer's org officer must be on those org boards. And the Executive Esto must be on those org boards. Otherwise these systems will continue to be submerged.

I mention this in order to get into action both the prod–org system and the Esto system. They must be called strongly to attention, otherwise they will go on being neglected.

This could be a major downfall of management and orgs if one just ceased to push these two successful points.

Thus I am calling to your attention the fact that you should use these systems so that we can recover this lost tech.

HCO POLICY LETTER OF 24 FEBRUARY 1972
ISSUE II

REMIMEO

ESTOs

(Originally written by LRH for the *Apollo* OODs of 24 Feb. 72. Issued as an HCO PL on 18 Sept. 80.)

An Esto has a definite job to do. He is not part of the division's lines. He hats, organizes, trains, sets up files, lines, and does all those establishment actions people need to *really* establish a division and maintain it.

If you want an Esto to go into gales of laughter, say "I am too busy to get hatted." Those papers and that enMEST show that a two hours of hatting a day save a year of dev-t nonproduction.

HCO over the world could not establish orgs. It can do its departmental functions. The answer is the Esto.

You'll be seeing a lot of this. Might as well know who these strange people are who keep insisting you find out about comm baskets and things.

L. RON HUBBARD
FOUNDER

HUBBARD COMMUNICATIONS OFFICE
SAINT HILL MANOR, EAST GRINSTEAD, SUSSEX

HCO POLICY LETTER OF 7 MARCH 1972R
ISSUE I
REMIMEO REVISED 13 APRIL 1972

ESTABLISHMENT OFFICER SERIES 1

THE ESTABLISHMENT OFFICER

PURPOSE

The Establishment Officer system evolved from the product–org system where it was found the HAS alone could not establish the org. The product–org officer system is entirely valid and is not changed. Tapes up to and including number 7 of the prod–org system (also called the FEBC tapes) are correct. From number 8 onward, the prod–org tapes are replaced by the Esto Series tapes. It is important to know that when the org officer is removed from a unit "because it now has an Esto" it will practically destroy the unit and crash its stats. Taking the org officer out of a division or org and making him the Esto is a guarantee of a crash. The Esto is an extension of the original HCO system as an Esto performs all the functions of HCO for the activity to which he is assigned *plus* his own tech of being an Esto.

The purpose of Establishment Officers is to ESTABLISH and MAINTAIN the establishment of the org and each division therein.

The term "Esto" is used for abbreviation as "EO" means Ethics Officer.

It has been found that the whole reason for any lack of prosperity of an org is INTERNAL. The surrounding area of the public has very little to do with whether stats are up or down. An org, by "delivering" out-tech and its own conduct, upsets its area but it can also straighten it out PROVIDING IT DOES ITS JOB. So this too is an internal cause.

Thus if an org is well established so that each staff member is doing his exact function, stats will go up and the org will prosper because it has been handled internally.

All booms and depressions of an org are due to its being expertly built up and then, having a peak period, is not maintained in that well-established condition and disintegrates.

In the vital flurry of getting the product and expanding, the org becomes disestablished.

In the product–org officer system of 1971 it was found uniformly that as soon as the org began to boom, the HAS was wholly unable to establish rapidly enough and the boom collapsed. HCO was too few to keep an org established even when the HCO was manned because THEY WERE NOT WORKING INSIDE EACH DIVISION.

The answer to these shortcomings is the Establishment Officer system. This preserves the best in the product–org system and keeps pace with product and expansion.

A well-trained, hard-working Esto in a division has proven to be the miracle of org prosperity.

The system has already been tested and is in successful operation.

Establishment consists of quarters, personnel, training, hatting, files, lines, supplies and materiel and all things necessary to establishment.

POSITION

The org board of Establishment Officers is:

Commanding Officer or Executive Director (coordinates)

Product Officer (operates org)
Org Officer (organizes for Prod Off)

Executive Establishment Officer (operates Estos)

Exec Esto Org Officer
Esto Establishment Officer
(Esto Course Supervisor)
} Combined Hat

(Div secs are in charge of div and are product officers.)

7	1	2	3	4	5	6
LRH Comm	HAS	Dissem Sec	Treasury Sec	Tech Sec	Qual Sec	Dist Sec
Div 7 Esto	HCO Esto	DEO	Tr EO	TEO	QEO	PEO

CO or ED Foundation
Org Off Fdn

LRH Comm Fdn	HAS Fdn	Dissem Sec Fdn	Treas Sec Fdn	Tech Sec Fdn	Qual Sec Fdn	Dist Sec Fdn
Fdn Div 7	Fdn HCO	Fdn Dissem	Fdn Treas	Fdn Tech	Fdn Qual	Fdn Dist

(Same Esto covers same div Day and Fdn.)

PRODUCTS

To understand what the Esto system is you have to understand first and foremost the meaning of the word "PRODUCT." (The whole system breaks down where this one word is not understood and not understanding this one word and failing to get it understood has been found to be the barrier in most cases.)

PRODUCE (verb) = To bring into existence, make; to bring about; cause.

PRODUCT (noun) = Someone or something that *has been* brought into existence; the end result of a creation; something or someone who has been brought into existence.

If you really know that definition you can then look over HCO PL 29 Oct. 70 I, Org Series 10, THE ANALYSIS OF ORGANIZATION BY PRODUCT. In this we have (1) establishing something that produces (Product 1), (2) operating that which produces in order to get a product (Product 2), (3) repairing or correcting that which produces (Product 3), (4) repairing or correcting that which is produced (Product 4).

Now in order to get an org there and make money and eat and get paid and things like that, these things like products have to be understood and the knowledge USED.

If we try to operate an org that isn't there, or repair it, nothing happens. No stats. No money. The product officer and org officer have nothing to run. They're like a pilot and copilot with no airplane. They don't fly.

So an Establishment Officer is there to put the airplane there AND get the pilot and copilot to fly it well, without wrecking it, to everyone's benefit.

So, the Establishment Officers put the org there to be run and put the people there to run it so they run it well, without wrecking it, to everyone's benefit.

POSTS AND TITLES

The org is commanded by the Commanding Officer (SO orgs) or the Executive Director (non-SO orgs). In the triangular system of the Flag Executive Briefing Course (FEBC) (product–org officer system) the CO or ED *coordinates* the work of the product officer, org officer and Executive Esto.

In most orgs the CO or ED is also the PRODUCT OFFICER of the org which is a double hat with CO.

The product officer controls and operates the org and its staff to get production. Production is represented by the gross divisional statistics and valuable final products of the org.

The ORG OFFICER assists the product officer. He gets production lined up, grooves in staff on what they should be getting out and makes sure the product officer's plans are executed.

(The duties of CO or ED, product officer and org officer are covered in the FEBC tapes 1 to 7.)

The EXECUTIVE ESTABLISHMENT OFFICER is the one who puts the org there to be run. He does this by having Establishment Officers establishing the divisions, org staff and the materiel of the division. He is like a coach using athletes to win games. He sends them in and they put their divisions there and maintain them. They also put there somebody to *work* them.

The EXECUTIVE ESTABLISHMENT OFFICER ORG OFFICER (Esto Org Officer) is the E Esto's deputy and handles his programs and the personal side of Estos.

The ESTABLISHMENT OFFICER'S ESTABLISHMENT OFFICER (the Esto's Esto) is the one who trains and hats and checks out Estos and establishes the Esto system. He also runs the Esto course that makes Estos and is the Esto's Course Supervisor. In practice, the hats of Esto Org Officer (above) and Esto's Esto Officer are held as one hat until an org is very large. The person who holds this post has to be a very good Course Supervisor who uses study tech like a master as his flubs would carry through the whole Esto system.

An ESTABLISHMENT OFFICER IN–CHARGE is an Esto who has Establishment Officers under him in an activity that has five or less Estos, does duties comparable to an Executive Esto for that activity.

A CHIEF ESTABLISHMENT OFFICER + DIVISION is an Esto who, in a division, has Establishment Officers under him due to the numerousness of the division.

A LEADING ESTABLISHMENT OFFICER + DEPARTMENT is a departmental Establishment Officer who has section Estos under him due to the numerousness of the section.

An ESTABLISHMENT OFFICER + SECTION is an Establishment Officer of a section where there is a departmental and divisional Esto.

The divisional Establishment Officers are as follows. If they have other Estos under them in the division the title CHIEF is put in front of the title.

THE DIV 7 ESTABLISHMENT OFFICER (Div 7 Esto) for Division 7, the Executive Division. He is not "The Executive Esto." He carries out all the Esto duties for this division.

THE HCO ESTABLISHMENT OFFICER (HCO Esto) establishes and maintains HCO.

THE DISSEMINATION ESTABLISHMENT OFFICER (DEO) establishes and maintains the Dissem Division.

THE TREASURY ESTABLISHMENT OFFICER (Tr EO) establishes and maintains the Treasury Division.

THE TECHNICAL DIVISION ESTABLISHMENT OFFICER (TEO) establishes and maintains the Tech Division. This division amongst all the rest is most likely to have other Estos in the division.

THE QUALIFICATIONS ESTABLISHMENT OFFICER (QEO) establishes and maintains the Qual Division.

THE DISTRIBUTION ESTABLISHMENT OFFICER (PEO for Public Division) establishes and maintains the Distribution Division.

The Exec Esto and Esto Org Officer and the Esto's Esto and Esto course are org boarded as in Dept 21.

The Estos themselves are in their own assigned divisions.

The CO or ED, product and org officer are org boarded in Dept 19.

HEAD OF ORG

The head of the org is the Commanding Officer or Executive Director. He is usually also the PRODUCT OFFICER. He is senior to the Exec Esto.

DEPUTY CO OR ED

The CO's or ED's DEPUTY handles the programs functions of the CO or ED and is the org's org officer.

He ranks *with* the Exec Esto.

HEAD OF DIVISION

The head of a division is the DIVISIONAL SECRETARY. He is the PRODUCT OFFICER of his division. His boss is the CO or ED.

He is senior to the divisional Esto or Chief Esto.

He is *not* the divisional Esto's boss. The E Esto is.

DEPUTY DIVISION HEAD

The DEPUTY SECRETARY of a division is the org officer of that division.

He handles the programs of the division for the secretary.

He ranks with the divisional Esto or Chief Esto.

DEPARTMENT DIRECTOR

He is the PRODUCT OFFICER OF HIS DEPARTMENT.

The divisional Esto is senior to him.

The departmental director is senior to an Esto posted to his specific department.

SECTION OFFICER

The officer in charge of a section is the PRODUCT OFFICER of that section.

He is junior to all Estos except an Esto posted directly to his specific department.

STAFF

Staff members other than those who are Estos are all considered PRODUCT 2 and 4 PERSONNEL from the viewpoint of the Esto whose products are 1 and 3 (see above or Org Series 10, HCO PL 29 Oct. 70 I).

TEST

The test of the successful Esto is whether he increases QUANTITY and QUALITY of PRODUCT 2 PER STAFF MEMBER AND AN ABSENCE OF DEV-T (developed or unnecessary traffic).

SMALL ORGS

An Esto In-Charge in a small org (2 to 5 staff not counting Estos) would be one of two Estos. He would handle the Esto system for that org and Divisions 7, 1 and 2 and the other Esto, Divisions 3, 4, 5 and 6. He would also run the Esto course as well as work the Estos.

With trained Estos actually functioning, the production of this small org would increase and one would have an evolution leading to an Esto I/C, one Esto for 7, 1 and 2 and another for 3, 4, 5 and 6.

Further evolving there would be an Esto I/C, one for 7, 1 and 2, one for 3, 4 and 5 and another Esto for Div 6.

With additional expansion there would be an Esto I/C, one for 7, 1 and 2, one for 3 and 5, one for 4 and one for 6.

Additional expansion would have an Esto I/C, one for 7 and 1, one for 2, one for 3 and 5, one for 4 and one for 6. This reaches the stage of five Estos for one Esto I/C.

We now upgrade the system to an Exec Esto and a deputy and one Esto per division.

Almost at once Tech will need a Chief TEO and a TEO. Then a Chief TEO and three Leading Estos for 4.

The system goes on evolving. One Esto to ten staff is the maximum allowed at this stage.

BUREAUX

Where bureaux are combined with the service org the divisional Esto also has the duties of the bureaux establishment.

In such a case there is an OPERATIONS ESTABLISHMENT OFFICER in charge of the four Operations Bureaux which combined make up the Operations Bureaux. He, as expansion occurs, will shortly become a Chief Esto for Operations (or Chief Operations Esto) with an Esto in each bureau — the Action Leading Esto; the Data Leading Esto; the Management Leading Esto; and the Ext Comm Leading Esto.

RULE OF EXPANSION

The Esto system may not be expanded nor may the org be expanded without comparable expansion of GI, delivery completions and success statistics.

The quality and skill of Estos in acquiring personnel, training, hatting, supplying, FP conduct and other duties is directly reflected in statistical increase of GI, delivery, success and VIABILITY.

ESTO TRAINING

The EXEC ESTO (or Esto I/C) is responsible for the quantity of establishment done and the quality and performance of all his Estos. EXEC ESTOs or ESTO I/Cs are trained on Flag or as designated by Flag.

Exec Estos or Esto I/Cs are usually granted the right to train Estos. For this they must have the packs and equipment. The actual training is done by their Esto Org Officer or when one exists, the Esto's Esto.

The actual hatting and training of Estos comes under the Esto's Esto, the Esto Org Officer generally wearing this hat.

In a crush emergency in any one of the mentioned divisions the EXEC ESTO goes in on Divs 7, 1 or 2 and the Deputy Exec Esto goes in on Divisions 3, 4, 5 and 6.

An Esto usually works the full day less conference time and studies an additional five hours minimum.

Where there is a Foundation, the same Estos as the Day org cover the Foundation as well until both Day and Foundation are too large to be so handled, at which time a Foundation begins a separate Esto function under its own Esto I/C. When all Foundation divs are separately covered, the Foundation has its own Exec Esto.

TRAINING OUTLINE

A full training outline of the skills required in an Esto follows:

An Exec Esto should be ideally a full FEBC. This covers the OEC and the product–org officer system.

An Esto I/C would have to know the OEC.

In addition to the above would be added these specific requirements:

Primary Correction Rundown (HCOB 30 Mar. 72)

Word Clearer — able to handle a meter and do Method 2 and Method 4, assess prepared lists and do good TRs

Vol 0 OEC (if not done on the OEC)

Vol 1 OEC (if not done on the OEC)

Org Series PLs

Personnel Series PLs

Data Series PLs

PR Becomes a Subject (FEBC tapes)

Mini Course Super Hat (Full HPCSC for the Esto's Esto)

ARC triangle materials

Dianetics 55!

FP policy (finance pack)

PTS phenomena HCOBs

DB and SP HCOBs and PLs

Psychosis HCOBs

HCO investigatory tech

Establishment Officer tapes series

Establishment Officer Series PLs

LRH ED 174 Int (1972), STUDY AND TECH BREAKTHROUGH

HCO PL 9 Apr. 72, CORRECT DANGER CONDITION HANDLING

There is a difference in what the Esto himself has to know to be hatted and what he must teach in his division. These are TWO different bodies of knowledge.

The Esto must know all the hats and valuable final products of any division he is hatting.

He should know the Product–Org series tapes.

He should know quarters and housing materials.

He should know the operating manuals and how to operate any machine in the division he is establishing.

On ships he should know the FOs.

Any FOs, FSOs and CBOs that may apply in a bureau.

The Esto becomes totally proficient in his own hat and makes others proficient in theirs. He has to be able to read and pick up data on another's hat very rapidly.

CASE REQUIREMENTS

(Not necessarily in program order)

TRs the Hard Way

Admin TRs

OCA not below center line

Physically well

Case gain

C/S 53 to F/N on list

If drugs, full Drug RD

GF 40RR to F/N on list

The HAS Rundown

F/N on White Form

Study Correction List

W/C No. 1

HATTING CYCLE

The cycle of hatting of Estos and of staff members is HAT some and get production, hat more and get production, hat more and get production. Hat to total specialization, get production. Hat to more generalized skill and get production. Hat an activity until it can do own and everyone else's hat in the activity and get production.

Quarters, supply, equipment, space, all follow this same gradient. Get it in, get it producing, get more in, get it producing.

ESTO TRAINING

An Esto has two hats. (A) His own hat as an Esto in which he must be expert. (B) The hats and skills he is grooving in on others.

The most skilled Esto learns his own job and that of the other fellow rapidly and thoroughly.

These two hats are separate and must be kept separate.

INVOLVEMENT

The Esto may not involve himself in the production cycles of a post or division except to learn it himself so he can hat expertly or get the HCO PLs or tech applied to it understood by himself so he can hat and debug the post.

The Esto *must* be an *expert* on Word Clearing Method 3 tapes and then W/C Method 4ing them.

He, in Europe, MUST KNOW FOREIGN LANGUAGE TRANSLATED TAPE HCOBs, PLs AND EXPERTISE.

HCO

HCO performs its normal duties per policy. It is not called on to establish the whole org, however, but is to back up Estos.

Personnel is obtained through Department 1 by Estos but these do not have to depend only on that but must clear personnel and changes through it.

EXEC ESTO's MAA

The Executive Esto has a MASTER–AT–ARMS in a large org.

The MAA musters the crew, conducts any exercises, does ethics investigations as needful especially by the Exec Esto and helps hat the Ethics Officers of the org. He does not replace these. He does other duties assigned.

PRODUCT CONFERENCE

The PRODUCT CONFERENCE is conducted by the CO or ED (or his deputy). It consists of the divisional heads of the org as each of these is a PRODUCT OFFICER.

It sets and reports on targets.

As the CO or ED as PRODUCT OFFICER investigates and does evaluations and writes programs, some of the actions of the product conference are furnishing data to debug. The Data Series and the OEC and FOs are the tech used. (The primary reason for failures of such a conference will be found to be [A] operating on wrong Whys, [B] lack of knowledge of conference tech which is mainly do homework for the conference [CSW] before it begins, not during it and do not monopolize conference time.)

Therefore product conference success depends upon:

1. Finding and operating on correct Whys.
2. Getting targets for valuable final products of each div or department that exchange with the society around them in return for income.
3. Ensuring adequate preparation (intelligent programs).
4. Debugging production programs.
5. Getting DONES, not not-dones or half-dones as they will become hidden backlogs in the org.
6. Coming to conference prepared.
7. Not monopolizing conference.
8. Actually punctually holding them.

IT IS UP TO THE EXEC ESTO TO HAT AND GET THE PRODUCT CONFERENCE OPERATING AND COMPETENT.

ESTO CONFERENCE

The ESTABLISHMENT OFFICER CONFERENCE is held by the Exec Esto (or his deputy).

This conference handles Esto matters, debugs Esto targets worked out by the CO/ED or Estos' projects, gets in reports of divisions and their personnel, hatting, supply, spaces, quarters, etc.

The Esto conference handles financial planning using FP policy in which the Esto must be proficient. (FP must be approved by the Treasury Sec and the Flag Banking Officer. The org has to be run on FBO allocations.)

This conference is governed by similar guide rules as a conference to the product conference.

The PRODUCT conference is senior to the Esto conference but cannot overrule its FP.

PROGRAMS

Estos as well as PRODUCT OFFICERS run on programs.

These are in accordance always with Data Series 23 and 24.

AIDES COUNCIL

An Aides Council or A/Aides (or International Secretary or Assistant International Secretary) Council is held as:

1. A product conference or
2. A program conference or
3. An establishment conference.

But never two or three of these at the same time.

SUMMARY

The Esto system has already proven a success.

It will be successful in direct ratio to its:

1. Staying on policy;
2. Setting no independent policy;
3. Operating only toward production;
4. Its Estos continuing to train and be well trained;
5. Consistently staying in the division and actively working in it to establish and maintain, better establish and maintain;
6. Setting an excellent example to staff as competent, helpful executives and staff members.

HCO POLICY LETTER OF 9 MARCH 1972
ISSUE II

REMIMEO

ESTABLISHMENT OFFICER SERIES 2

HATTING THE ESTO

It will be found that hatting rules and procedures apply to the Esto himself.

In orgs while under training he himself is hatted and produces alternately, doing better and better.

He must NOT be let off hatting until he is *fully* hatted.

And he shouldn't, especially when being trained in an org by an Esto I/C, be let off establishing on the excuse he is not yet fully hatted.

IMPORTANCE OF ESTO HAT

It will be found that some Estos back off from an area because "they do not know all the tech lines and hats in that area."

The reason they give for this back-off is the wrong Why. They back off or fumble when they are not hatted as Estos! Not because they are not hatted on the area's hats.

Just like the housewife who criticizes her neighbor for a cluttered backyard while standing in a more cluttered one of her own, hatting begins at home.

If an Esto knows his business he could straighten up a huge corporation using the Esto system with never a whisper of their business!

It would be tough. But it shows where the importance lies.

There is Esto tech. When it is not known or used, then an Esto can just sink down into a division puzzled and apathetic, thinking *its* tech is what is bogging him.

He daily sees and talks to people swamped in dev-t, unsure, nervous and wide-eyed with problems and questions.

If an Esto does not at all times KNOW HE IS AN ESTO and ACT LIKE AN ESTO he can easily slide into these confusions and try to handle production-performance problems that are outside the Esto's line of duty.

FIRST, LAST AND ALWAYS IT IS THE ESTO HAT THAT MUST BE WORN IN ANY GIVEN SITUATION.

Thus the A (own hat) and B (div tech and hats) differences of hats is important to know.

It's great to know and one should know a division's tech and hats. But this is something one learns as he goes along.

It's a matter of THE MOST VITAL IMPORTANCE that the Esto wears his Esto hat.

That's the hat he has to have down cold.

Then he will find that org and division confusion is nothing to him.

HE HANDLES THINGS LIKE THAT!

HE IS AN ESTO!

HCO POLICY LETTER OF 9 MARCH 1972
ISSUE III

REMIMEO

ESTABLISHMENT OFFICER SERIES 3

DEV-T AND UNHATTEDNESS

The first thing an Esto runs into in an area that is not hatted is DEV-T (developed unnecessary traffic).

People in an org can be working frantically, totally exhausted and yet produce nothing of value. The reason is that their actions are almost totally dev-t.

The WHY of this is UNHATTEDNESS.

The people on the posts do not know their own hats or even if some do they are dealing in the "NOISE" of other people who don't know their own hats.

Few if any of these people know the other hats or duties of the org and so don't know where to go for service or who to approach or despatch for what.

So it's not an org or a division. It's a nonproductive chaos.

The answers are three:

1. Get dev-t understood and

2. Get the staff at least instant-hatted at once.

3. Chinese school (staff or div staff all together in front of a big org board chanting together the hats, duties and products of the org as visible on the org board).

In order to get anything done at all or even begin this, an Esto Ethics Officer function has to be in.

A schedule has to be posted including exercise, post time and study and staff has to be mustered and handled at these periods. This gets some awareness of the org group as a team of people with similar purposes.

DEV-T

Dev-t packs are made up. These consist of:

HCO PL	2 July 59 II	DEVELOPED TRAFFIC THE DELIRIUM TREMENS OF CENTRAL ORGS
HCO PL	19 Aug. 59 III	HOW TO HANDLE WORK

HCO PL	4 Sept. 59 I	COMPLETED STAFF WORK
HCO PL	17 Nov. 64 I	OFF–LINE AND OFF–POLICY YOUR FULL IN–BASKET
HCO PL	31 Jan. 65	DEV-T
HCO PL	8 Feb. 65	DEV-T ANALYSIS
HCO PL	13 Oct. 65	DEV-T DATA EXECUTIVE RESPONSIBILITY
HCO PL	5 Jan. 68 I	OVERFILLED IN–BASKET BAD NEWS
HCO PL	27 Jan. 69	DEV-T SUMMARY LIST
HCO PL	30 Jan. 69 II	DEV-T SUMMARY LIST ADDITIONS
HCO PL	27 Oct. 69 I	AKH Series 23 DEV-T
HCO PL	4 Nov. 69	DEV-T GRAPHED
HCO PL	23 July 71	TELEX COMM CLARITY (Dev-t Series)
HCO PL	25 Oct. 71 I	COMM ROUTING, HOW TO TIE UP A WHOLE ORG AND PRODUCE NOTHING
HCO PL	27 Feb. 72	Exec Series 9 ROUTING
HCO PL	29 Feb. 72 I	Exec Series 10 CORRECT COMM

These packs are issued to staff members and they are required to check out on them.

Each staff member keeps a dev-t log and writes down the name of anyone he is getting dev-t from and also issues Dev-t Chits.

HATTING

The staff at the least are instant-hatted at once — place on the org board, work space, supplies, what his title is and what it means, org comm system, what he is supposed to produce on his post.

He is gotten producing what he is supposed to produce in some volume at once.

Hat checklists and packs are verified as there or are gotten ready.

A full hat checkout can then begin.

Courses he needs are done in staff study time.

Actually hat study and checkout is done on the post a bit each day.

This is in fact "on-the-job training," as he is expected to go on producing while he is being hatted.

ORG BOARD

Org bds are rapidly gotten up or up-to-date in the org (in HCO) and (full org bd) in each division.

Each division is Chinese-schooled, first on its own org bd, then on the org as a whole, in such a way that they know the duties of divisions, departments and posts and the flow lines of the org.

Wherever an org or even a division falls apart or slows up, this campaign is repeated.

SAMPLE ORG ED

This is a sample Executive Directive (ED) giving a program written for an actual org where the above was done to cure dev-t and get the org hatted and producing:

ED _____ Date _____

TOP PRIORITY

Takes priority over all other EDs
(as they can then be gotten done!)

CORRECT COMM PGM

SITUATION:

It has been very difficult to handle the org.

DATA:

A long and intensive collection of data has finally culminated in discovering, through reports on comm and inspections by showing why the org appears fantastically busy and overworked while producing very little even when it was found the org was insolvent.

Ethics has been very heavy for some time and has not led to any spectacular recovery.

But the comm line reviews and analysis reveal

INVESTIGATION:

The org and all its units is drowning in DEV-T. HCO is even generating it. This makes an appearance of frantic action and overload while little is produced.

And an analysis has produced a

WHY:

The org is almost totally unhatted and untrained.

DEV-T comes only from AN UNHATTED UNTRAINED ORG.

STATS:

Out the bottom and below the briny bedrock of the sea so far as finished products per man-hours and as far as GI by reason of the org are concerned.

IDEAL SCENE:

A whole staff and the org fully hatted and producing only correct comm without dev-t and at work actually producing things of real value which will *exchange* for value.

HANDLING:

THE ESTO SYSTEM AND DEV-T PLs HANDLE THIS.

1. Admin Cramming and each Esto to be furnished with packs of dev-t policies at once including last Exec Series PL Routing and new dev-t PL Correct Comm.

ALL HANDS DISSEM _____

2. FULL Esto setup to be gotten on post at once. They go on duty and part-time train.

HAS _____

3. Existing Estos and those to be put on at once to hammer, hammer, hammer all posts on off-line, off-origin and other points of dev-t so they are UNDERSTOOD.

EXEC ESTO _____

4. Big paper org bd with new complement to be gotten up at once in HCO.

HCO ESTO _____

5. Big paper org bds from it to be gotten up in each div and the div Chinese-schooled on it. Specializing in the div but also covering the whole org so people know where they are and what each handles and where other terminals in the org are so they can properly route to or go to them for the exact service of that exact post.

DIV ESTOs under EXEC ESTO _____

6. Straighten out the comm lines of each post.

EXEC ESTO/DIV ESTOs _____

7. Report to his div Esto (see org bd) or Ethics Officer any person originating off-line, off-origin traffic or failing to originate from his post paper or body or remark. Report by "Dev-t Chit."

EVERYONE IN THE ORG _____

8. Send flagrant offenders to Admin Cramming.

EXECUTIVES _____

9. Put in:

    1. Instruct, and if no improvement

    2. Cram, and if no improvement

    3. Retrain, and if no improvement

    4. Offload

    where hatting continues to fail to produce rapid comprehension of dev-t and/or persistent inability to actually DO his hat. Court of Ethics or Comm Ev on request to remedy any injustice.

    ESTOs _____

10. Excuses concerning hatting and arbitraries like "only study hat in hatting college" to be wiped out and any barriers to getting on-policy, on-FO-FSO wiped out by Ethics action or Cramming.

    ESTOs _____

11. Instant-hat every staff member.

    DIV ESTOs _____

12. Chinese-school every division.

    DIV ESTOs _____

LET'S MAKE THIS A CRACK ORG WE CAN BE PROUD OF!

EXECUTIVE DIRECTOR

The above program can be completed in a few days.

It is followed by further programs to get in lines of the org, full hatting, and proper comm setups for each staff member, etc.

If the program falls out or dev-t flares again, (A) REHAT Estos and (B) do the program once more.

The org will come right and begin producing PRODUCTS WHICH EXCHANGE FOR VALUABLES.

The org will become solvent.

Only the Esto system makes such a program possible.

We have long had the tech as you can see by the PL dates. Dev-t tech has existed since the mid-1950s. But it could not be gotten in swiftly enough to make a startling change in the org morale or stats until Estos were on post in an org.

If it does not go in rapidly even with Estos, then some of the Estos are not well enough or firmly enough hatted *as* Estos; and the answer of an Exec Esto or Esto I/C is to very rapidly cram his Estos or, following the (1) instruct, (2) cram, (3) retrain, (4) offload pattern, improve his Esto team.

Fully done, the program works like a beautiful breeze bringing peace and a cheerful staff.

HCO POLICY LETTER OF 10 MARCH 1972

REMIMEO

ESTABLISHMENT OFFICER SERIES 4

EXEC ESTO HATTING DUTIES

An Esto I/C or Exec Esto has as his primary duty *the hatting and handling of ESTOs*.

It will be found that an Esto tends to get pulled into operating the division when (a) he is too new at it and (b) he fails to establish.

Such hatting actions usually require a repeat checkout or harder assertion of the PLs relating to HCO such as "musical chairs," "don't unmock a working installation." Such PLs cover the host of errors that HCOs and HASes have made.

Usually the Esto in training just doesn't know the material or even believes it's all "old" because it came before the Esto system. The prime cause of alter-is is just not knowing or understanding the material.

The system of (1) instruct, (2) cram, (3) retread applies to Estos in training.

WHYS

Like in auditing the situation may look so desperate that unusual remedies are thought to be needed.

The skill of an Esto in rapidly finding a Why (as in investigation tech and the Data Series) and quickly handling is what makes a real Esto.

Dreaming up new solutions not in policy usually comes from not really investigating and finding a Why.

Finding Whys is like seeing real gold for the first time. Until a person really finds a REAL Why that promptly unravels the whole knot he is like the tourist in the gold field who can be sold any yellow glitter as being gold. But when he sees real GOLD for the first time he never after can be fooled.

Usually first Whys an Esto I/T finds about a post or a class or a line are usually so shallow and so narrow that they are just dev-t. They would resolve nothing.

The Exec Esto will have to keep an Esto I/T at it, looking again, looking again, looking again.

An Esto I/T will first think of removals. Then he will think of doing musical chairs. Then he will think of having only the BEST people. He's going along the old worn

ruts of human prejudice and impatience. He is not really looking for a Why there in front of him but at his or another's dreams.

An Esto I/T usually buys whatever Why the person on the post gives him. He mistakenly believes "but he has more experience with the scene" and "I am so green on this scene that . . ."

This piece of tech applies IF THE WHY THE PERSON OR AREA HAS WERE THE RIGHT WHY THERE WOULD BE NO TROUBLE THERE.

This comes from "the problem a pc thinks he has isn't the problem he has. If it were it would as-is and he wouldn't have it."

Whys are obtained by observing the obvious (obnosis) closely enough to find the biggest OUTPOINT that explains all the nearby outpoints (always a lack of production or low production per high man-hours).

Whys are traced back from the PRODUCT, its absence or lack of volume or quality.

So an Esto I/T has to be sent in again and again and again until he finds THE Why. And then the post unsnarls rapidly.

Example: TR Course product horrible, slow and upsetting the inflow of new people. Esto I/T was ordered to hat the TR Supervisor. After much blow-off, apathy, TR Super in tears, the Esto I/T said HE would take over the course. Wrong answer. It couldn't be more wrong. Esto I/T bypassed, an experienced Esto investigated students, Super and area and within about three hours found it. The Super was so unhatted that WHAT IS A COURSE? PL was wholly out. The TR students had no packs of their own, could not read those and weren't being supervised either and just struggled on with the unhatted Super falsely reporting how great the students were doing (while they didn't finish and wanted to blow).

Now what did this Esto I/T do wrong?

He didn't work out the product: successfully completed exultant students.

He didn't then start hatting the Super with just standard HCOBs about TRs and supervising.

He didn't check the course as a COURSE against WHAT IS A COURSE? PL to know what was missing on it.

Had he just done his job as an Esto he would have found the Why.

The course, of course, resolved at once and got the product.

BEWARE

A person training to be an Esto himself can be very guilty of dev-t to his senior Esto.

By *bringing a problem* to a senior without having resolved it, HE CAN GET HIS SENIOR UPSET, ALARMED, DESPERATE AND PULLED INTO THE DIVISION!

These solutions of "transfer this one or that," "comm ev this one or that," "this situation is so ghastly that (and there follows some wild solution that sounds like 'stand the pc on his head')" are simply abandonment of standard actions.

As the observation is bad, the Why is not found. Then the situation looks unusual. So unusual remedies are urged.

And a senior can be dragged right in!

CORRECT ACTION

Anyone handling Estos in training has to use the standard action of:

1. Get the packs of that post! (Or area or div he's trying to handle or proposes the unusual solution for.)

2. Look over the policy materials! (May include discard of "former occupant hat write-ups" and looking into PL or FO or files for the real materials about it. May include Word Clearing 4 or a clay demo or a Why as to why the Esto can't dig them.)

3. Work out the product of that post! (Or course or section or dept or div or even the org. May require getting the word PRODUCT understood or Word Clearing Method 4 on the Esto I/T, or even the "Management Power Rundown" or cram on products or any other standard action such as even finding Why he can't dig *products*.) (And it may require "detective" work on the materials of the post to find out what is continually talked ABOUT so one can figure out from *that* what the product would have to be.)

4. Be sure it is the major EXCHANGE product of that post! (Or dept or div or area. May require reviewing the Esto I/T on EXCHANGE, its PLs and the Esto tapes.)

5. Check it with the product officer! (The head of the dept or div or org and don't be startled if he has a cognition on it or if he violently disagrees with it while having his own product wildly nonexchangeable! Which opens up a whole new situation! Or he may simply suggest a revision of the wording. BUT THIS POINT HAS TO BE CLEARED or the Estos will find themselves going east while the product officers go west!)

6. Go to your area! (This may include making the Esto I/T do TR 0 on the area or running him on bodily reaching and withdrawing from it and other drills or even a third party investigation.)

7. Observe the scene! (Which may mean having to wait until it has traffic or action in progress. It may mean a microphone plant as on an auditor or a tape of an interview with a voice start–stop operated recorder to catch the traffic, but it generally means just looking and comparing what one sees to the key PL about it or an ideal scene as would have to be in order for a product to occur in it.)

8. Find the Why! (And that means investigation tech and the Data Series. It can be formally written up or just there it is!)

9. Get it accepted! (Which can mean argument or HE&R or violence or blows off post if it isn't the right Why or the person is just plain SP. The right Why brings in GIs almost always. It's usually as obvious as a bass drum in the middle of the floor once *seen*.)

10. Have (him, her or them) GET IT IN! (Which can mean a project written per Data Series 23 and 24 or it can be just "do it.")

11. Straighten up the (spaces, lines, materiel, personnel) indicated by the Why.

12. Hat the person (personnel) to get production! (Could mean begin to hat, wholly hat, could mean train further, could mean find the Why that stops him or them from being hatted, but it means get better hatting DONE.)

13. Review to find if production increased! (Means look it over again to be sure it was the right Why found as a Why must lead to a nearer approach to ideal scene. Usually means INCREASED STATS for the area.)

14. Train the Esto I/T better.

DOGGEDNESS

The protection of an Esto I/C or Exec Esto is his own insistence along the lines of the above.

The moment he comes off of holding this line of hatting his Estos and keeping them at it, the less successful he will be.

If he doesn't do this, the next thing he knows he will be in total exasperation with the *org* and will be pulled right into it himself.

AUDITORS

We've been through all this before training auditors in 55–58. Ds of P and I.

They often had unusual solutions. They also would say they had "already done that" so we had a trick — "*What* did you do?" And we'd hear some *other thing* than what was ordered.

We know all about that.

And today when we apprentice them in orgs, boy, they really come out as real auditors!

So we know all about getting standard actions really done.

And there IS a thing called standard tech.

And there is a thing called STANDARD ADMIN.

Above is the 1 to 14 of making a real Esto and thereby a real org. This is really third dynamic auditing for production.

RULE

The EXEC ESTO or his deputy must okay every major action any Esto means to take to be sure it is ON–POLICY, ON–LINES.

HOLD THE FORM

The one thing an Esto I/C or Exec Esto ALWAYS DOES is hold the form and lines of the org.

EQUIPMENT

An Esto I/C or Exec Esto should have a 1–14 checklist with a blank at the top for the Esto's name and date and time.

When a solution is brought in he enters the Esto's name and date and a note of it.

Then he or his deputy keeps tabs on it by checking off the dones.

Such an action as 1–14 takes little time, actually. Twenty-four hours is an AGE.

He will find that some of his Esto I/Ts can't complete them rapidly, a rare one can't complete at all. This needs a Why itself. And maybe a retread or, that failing, a replacement.

A policy and HCOB library like the Qual Library is a necessity. You can't hold the form of an org with no record of the form.

FAITH

Faith in the system comes first, then faith in the Esto I/Ts and then faith in the org will prevent a lot of shooting.

But a few right Whys then show that it usually isn't evil. It's just outpoints. AND THAT THESE CAN BE HANDLED. The real gold of REAL WHYS.

This restores one's faith. Rapidly.

SIGN

And on his desk, facing outward, the Exec Esto should have a sign:

THE ANSWER TO YOUR
OFF–POLICY SOLUTION IS "NO!"
FIND THE WHY.

HAT HAT HAT

An Esto is busy hatting staff, handling lines. He is being hit with weird solutions. Product officers talk to them about how it should really be established (while not themselves producing or getting anything produced).

Someone has to hold the Esto stable as an Esto.

That's the senior Esto of the org.

He hats Estos while they establish. He demands establishment! And he gets it if he hats, hats, hats Estos and keeps them establishing. He IS the real holder and expander of the form of the org. Via his Estos.

HCO POLICY LETTER OF 13 MARCH 1972

REMIMEO

ESTABLISHMENT OFFICER SERIES 5

PRODUCTION AND ESTABLISHMENT ORDERS AND PRODUCTS

The situation one often finds in an org, after one has to some degree conquered dev-t, is that PEOPLE REQUIRE ORDERS. For years I wondered why this was so. Well, I found it.

WHEN PEOPLE DO NOT CLEARLY KNOW WHAT THEIR PRODUCTS ARE THEY REQUIRE CONSTANT ORDERS.

To the Establishment Officer, this reflects most visibly in trying to get program targets DONE.

Some people have to be ordered and ordered and ordered and threatened and howled at. Then, in a bewildered way, they do a target, sometimes half, sometimes nearly all.

Behind this apparent blankness lies an omitted datum. When they're like that they don't know what their product is or what it adds up to. Or they think it's something else or should be.

That blankness can invite overts.

It is very seldom that malice or resentment or refusal to work lies behind the inaction. People are seldom that way.

They usually just don't understand what's wanted or why.

Because they don't know what a PRODUCT is!

A whole Ad Council of a downstat org was unable even to *define* the word.

They had required orders, orders, orders and even then didn't carry them out.

HAT SURVEY FOR ORDERS

A staff member who requires orders may also think that any order is a policy and lasts forever. If you look into hats you will even find casual "close the door" type of orders given on one occasion to fit one circumstance are converted over into STANDING (continued) ORDERS that forever keep a certain door closed.

An Esto surveying the hats of a unit may very well find all manner of such oddities.

It is a standard Esto action to survey hats.

In hats you will find despatches giving specific orders or quoted remarks preserved instead of notes on what one has to know to produce a product.

In auditors' hats, directions for *1* specific pc in 1960, never published and from no tape or correct source, held on to like death like it was to be applied to every pc in the world!

A dishwashing hat may have orders in it but not how to wash dishes rapidly and well.

This is all a symptom of a unit or activity that does not know what its products are.

DISESTABLISHMENT

Where you find lots of orders kicking around, you will also find disestablishment by bypass, command channels not held and staff members like to take their orders from anyone but those in authority — any passerby could give them orders.

This is rampant where an executive has not been well on post.

By counting such orders up and seeing who they are from one can determine the unhattedness of staff, their org bd weaknesses and principally their lack of knowledge of their products.

HATTING FOR PRODUCT

If an Esto is to hat so as to get the staff member to get his product out, then the Esto has to know how to clear up "products."

Now an Esto is an Establishment Officer. There are product officers. The product of an Esto is the establishment. Then what is he doing with products?

Well, if he doesn't *hat* so staff members get out products then the org will be a turmoil, unhappy and downstat.

Production is the basis of morale.

Hattedness is a basic of third dynamic sanity.

But if you don't HAT SO AS TO GET THE STAFF MEMBER YOU ARE HATTING PRODUCING YOU WILL HAT AND HAT AND IT WILL ALL BE IN VAIN. The person won't stay hatted unless he is hatted so as to be able to produce.

The product officer should be working to get the products out.

So if you don't hat for the product then the staff member will be torn between two sets of orders, the Esto's and the product officer's.

Only when you hat to get product will you get agreement with product officers.

If you are in disagreement with product officers, then the Esto is not hatting to get production.

RIGHT WAY TO

There is a right direction to hat. All others are incorrect.

1. CLEAR UP WHAT THE PRODUCT IS FOR THE POST. AND HAT FROM THERE.

2. HAT FROM THE TOP OF THE DIVISION (OR ORG) DOWN.

These are the two right directions.

All other directions are wrong.

These two data are so important that the failure of an Esto can often be traced to violation of them.

You can have a senior exec going almost livid, resisting being hatted unless you hat by first establishing what the *product* is. If PRODUCT is first addressed and cleaned up then you can also hat from the top down.

If this is not done, the staff will not know where they are going or why and you will get silly unusual situations like, "All right. So you're the Establishment Officer. Well, I give up. The division can have 2½ hours a day establishment time and then get the hell out of here so some work can be done . . . !" "Man, you got these people all tied up! Stats are down! Can't you understand . . ."

Well, if you don't *do* 1 and 2 above you'll run into the most unusual messes and "solutions" you ever heard of, go sailing off-policy and as an Esto wind up at your desk doing admin instead of getting your job done in the division. And an Esto who is not on his feet working in the division is worth very little to anyone.

So see where the basic errors lead and

Hat on product before doing anything else and

Hat from the top down.

STEPS TO CLEAR "PRODUCT"

This is a general rundown of the sequence by which *product* is cleared and re-cleared and re-cleared again.

This can be checklisted for any exec or staff member and should be with name and date and kept in the person's "Esto file folder" for eventual handing to his new Esto when the person is transferred out of the division or in personnel files if he goes elsewhere.

1. Clear the word PRODUCT. _____

2. Get what the product or products of the post should be. Get it or any number of products he has fully, fully stated, not brushed off. _____

3. Clear up the subject of *exchange*. (See HCO PL 27 Nov. 71 I, Exec Series 3, Finance Series 6-1 and HCO PL 3 Dec. 71, Exec Series 4, Finance Series 6-2.) _____

4. Exchange of the product internal in the org. For what valuable? _____

5. Exchange external of the valuable with another group or public. For what valuable? (Person must come to F/N VGIs on these above actions before proceeding or he goes to an auditor to get his Mis-Us and out-ruds very fully handled.) _____

6. Does he want the product? Clean this up fully to F/N VGIs or yourself get E/S to F/N or get an auditor to unsnarl this. _____

7. Can he *get* the products (in 2 above) out? How will he? What's he need to know? Get him fully settled on this point. _____

8. Will it be in volume? What volume? Is that enough to bother with or will it have to be a greater volume? Or is he being optimistic? What's real? What's viable? _____

9. What quality is necessary? What would he have to do to attain that? To attain it in volume? _____

10. Can he get others to want the product or products (as in 2 above)? What would he have to do to do this? _____

11. How do his products fit into the unit or section or department or division or the org? Get this all traced. _____

12. Now trace the blocks or barriers he may believe are on this line. Get what HE can do about these. _____

13. What does he have to have to get his product out? (Alert for unreasonable "have to have before he can do" blocks.) _____

14. Now does he feel he can get his product or products out? _____

_____
Signature of Esto
or Clearer

NOW he really can be hatted.

BRUSHOFF

Quickie handling is a very, very bad fault. "Quickie" means a brushoff "lick and a promise" like wiping the windshield on the driver's side when really one would have to work at it to get a whole clean car.

So don't "quickie" product. If this is poorly done then there goes the old balloon. Hatting won't be possible.

Orders will have to be poured in on this terminal. Dev-t will generate. Overt products will occur, not good ones. And it won't be worthwhile.

DISAGREEMENT

There can be a lot of disagreement amongst product officers and Estos on what products are to be hammered out.

In such a case, or in any case, one can get a Disagreement Check done in Dept of Personnel Enhancement (who should look up how to do one).

This is a somewhat extreme way to settle an argument and should only be a "when all else fails."

It is best to take the whole product pattern of the org apart with the person, STARTING FROM THE BIGGEST PRODUCT OF THE ORG AND WORKING BACK TO THE PERSON'S PRODUCT.

Almost always there will be an outpoint in reasoning.

An exec who *only* wants GI can be a trial as he is violating EXCHANGE. As an org is paid usually before it delivers, it is easy to get the org in trouble by backlogs or bad repute for nondelivery. An org that has credit payments due it that aren't paid maybe didn't deliver. But Div 3 may soften up collections for some reason like that and then where would the org be?

Vol 0 of the OEC Course gives an excellent background of how a basic org works. As one goes to higher orgs, lower orgs are depended upon to continue to flow upward to them. (See HCO PL 9 Mar. 72 I, Finance Series 11, INCOME FLOWS AND POOLS, PRINCIPLES OF MONEY MANAGEMENT.)

A study of Vol 0 OEC and a full understanding of its basic flows and adapting these to higher orgs will unsnarl a lot of odd ideas about product.

The Esto has to be very clear on these points or he could mis-hat a person.

Usually however this is very obvious.

Heads of orgs and divisions have had to organize so long they get stuck in it.

They will try to order the Esto.

This comes about because they do not know their products or the Esto is not following 1 and 2 above and does not know his own product.

The product officer may try to treat the Esto as a sort of "organizing officer" or a "program officer" if

A. The Esto is not hatting to get production.

B. The product officer is not cleared on product.

So it comes back to the 1 and 2 first mentioned.

You can look over it now and see that if one is not doing these two things, dev-t, nonviability and orders will occur.

So where you have dev-t, down stats and orders flying around, you know one thing that will resolve it:

SOMETHING WILL HAVE TO BE IRONED OUT ABOUT *PRODUCT*.

When it all looks impossible, go to this point and get to work on 1 and 2.

L. RON HUBBARD
FOUNDER

HUBBARD COMMUNICATIONS OFFICE
SAINT HILL MANOR, EAST GRINSTEAD, SUSSEX

HCO POLICY LETTER OF 14 MARCH 1972
ISSUE I

REMIMEO

ESTABLISHMENT OFFICER SERIES 6

SEQUENCE OF HATTING

1. The Executive Establishment Officer or Establishment Officer In-Charge hats and keeps Estos working in their areas.

2. The Estos work in their areas hatting and establishing.

3. The product officers get production.

In that way the org is built or expands stably. In that way the org is prosperous, the staff is happy.

If some other sequence is being tried or other things are happening then the org is likely to be slow, upset or nonviable.

When an org has both an Exec Esto and an Esto I/C or Chief Estos or Leading Estos the Exec Esto shall hat all the Estos and the I/C or Chief or Leading Estos especially until they can safely be trusted to become a 1A relay point in the above where 1 would be "The Exec Esto hats all Estos I/C, Chief and Leading Estos until they in turn can hat and handle their Estos as per 2."

SPEED

Power is proportional to the speed of particle flow. This applies to despatches, bodies, materiel and anything else that can be called a particle.

What then slows things down?

UNCERTAINTY.

Many things can cause uncertainty. Threats, transfers, rumors.

People want their posts. Leave one without one awhile and see what happens!

Firm establishment, unchanging orders give certainty.

Nothing however causes more uncertainty than what one's product is.

Or if he can get someone to get out a product.

As certainty becomes firm on the product of a post or org, the ability to get it out, then all else falls into place and establishment has occurred.

BYPASS

It is easy for an Exec Esto or Esto I/C or any Esto to imagine he could make it all right by just bypassing and doing the product job. If he does that he fails as an Esto and the staff becomes uncertain as they feel they can't get out the product.

SPEED UP

If you want to speed up an org just do the usual 1, 2, 3 as given above.

The org will become certain.

It will speed up.

ESTO DESKS

Estos who do lots of admin are not being Estos. They belong on their feet or at best sitting with a staff member hatting him.

When an Esto has given up he begins to do admin.

Of course one has to do org boards and CSWs for posting, lines and materials. And one does have despatches. But if these require more than a couple hours a day something is very wrong.

The Esto is the only one who MUST bring a body.

ASSISTANT MASTER–AT–ARMS

In a very large org there are at least two Esto Masters-at-Arms.

Both have crew mustering, exercise, etc. Their functions can interchange.

But the senior is the Exec Esto's MAA for investigation and finding Whys.

The Assistant MAA is the one who helps handle the Estos and cross-checks on them and helps them and acts as liaison between them and the Ethics Officer or HCO terminals of the org.

Estos do NOT go to the HCO Esto for HCO PRODUCTS. They go to the HCO terminals involved or, far better, put it via the Asst Exec Esto's MAA — "the Esto's MAA." And *he* does not go to the HCO Esto either but to the proper terminals in HCO.

The Assistant MAA should know at any given moment where to find any Esto in the org. This is so he can get them for the Exec Esto or locate them due to emergencies.

He is their personal troubles terminal.

He verifies their presence at any muster.

He is in fact keeping the lines in between the Exec Esto and the Estos.

It is all done by body traffic, not by any despatch.

In an exact division of duties the Senior Exec Esto MAA is responsible for the whole *staff* as people. And how they influence org form.

The Assistant Esto MAA is responsible for the Estos as Estos on post and as people. And how they influence the Esto pattern of operations 1, 2 and 3 above.

SUMMARY

Thus the pattern can be held.

If it is, the wins are fantastic.

It is an easy pattern to hold.

It can be done.

ORGS ARE BUILT OF PEOPLE.

ESTOs WORK DIRECTLY WITH PEOPLE.

And the pattern of the work is 1, 2 and 3 above.

REMIMEO

ESTABLISHMENT OFFICER SERIES 7

FOLLOW POLICY AND LINES

About the fastest way Estos can unmock an org is pursue the fatal course of org officers in the first product officer–org officer system.

These org officers bypassed all normal lines for personnel, materiel, spaces and supplies and by disestablishing in that fashion tore more org apart than they built. This made it almost impossible for the lonely HAS to establish anything.

An Exec Esto especially and any Esto must:

1. Get personnel on usual channels.

2. Get materiel only by proper procurement.

3. Get and use spaces only according to standard CSW to the authorities involved — usually the CO or ED.

4. Get supplies only by the exact purchase order and supply channels.

5. Follow the exact admin lines designed to achieve establishment.

For, after all, those lines ARE a major part of establishment.

If these lines are not in they must be put in.

If the Exec Esto and Estos cannot or do not follow the *exact* procedure required in policy or routing forms or admin patterns THEY WILL TEAR THINGS UP FASTER THAN THEY CAN BE GOTTEN IN.

Estos must be drilled on these lines until they are truly in and effective.

It is up to them to set the example to others.

LINES

Lines that cross from one division to another such as public lines are under the control of Dept 2 HCO.

They are dummy run by the Dir Comm under the guidance of the HCO Esto and with the cooperation of the Esto conference.

These lines are vital to an org.

This is also true of personnel *lines*, supply *lines* and routing forms for new staff or transfers or any other action that may involve two or more divisions.

Lines within a division are the business of the Estos of that division.

Where departmental Estos exist, the lines linking up departments are handled by the Esto conference of that division.

INVISIBLE

Lines are invisible to many people. They disregard them and chaos results.

Thus Estos of all people must see that edges are put on those lines, usually in the form of HCO routing forms and ethics actions for violations.

AN ORG WHOSE ADMIN OR BODY LINES ARE BEING VIOLATED WILL DISESTABLISH.

What is gained in sudden action is lost in disestablishment. The seized desk without permission, the grabbed space without proper allocation, the ripped-off supplies for lack of chits and supply lines, the suddenly transferred personnel all end up with a headache for somebody else and an unmocked area.

WORKING INSTALLATION

DO NOT DISESTABLISH A WORKING INSTALLATION!

Example: An exec spends months building up a producing Qual Div. The Qual Sec is suddenly ripped off without replacement and apprenticing the replacement. The div collapses. There went months of work. It was far more economical to have a Qual Sec In-Training under that Qual Sec for a month or two before the transfer.

Using the wrong personnel pools for want of proper recruiting and training is the downfall of most orgs.

Because it wrecks working installations.

This applies as well to org machinery. Don't wreck one machine to get a part for another. And don't ever take one apart that is running well.

OPERATIONAL

The definition of OPERATIONAL is running without further care or attention.

Anything that needs constant fiddling or working at to make it run is non-operational! It must be repaired fully or replaced.

Man-hours and time waste easily eat up any value of the inoperational machine.

Further, a machine that is forced to run that does not run well may then break down utterly and expensively. The time to repair is *soon,* the moment it cannot be run without great care or attention.

OPERATIONAL is a key definition that answers many problems.

It is also true of people. Those who need continual pushing around or rounding up cannot be considered operational. They can absorb time totally out of proportion to worth.

This is no license to shoot staff down. But it is a warning that where too much time is absorbed trying to make a staff member functional he cannot be considered OPERATIONAL.

If an Esto spent 100 percent of his time for weeks on just one staff member and let the rest go hang, he'd soon find he was rewarding a downstat as well as violating the definition of operational.

RIGHT TARGET

A working unit that is getting on well, has an already established activity even to internal training, is not the right target for an Esto to reorganize.

His whole activity should be to get it support and new trainees for it. His internal functions should be minimal so long as it runs well.

He helps it without hindering it.

Putting a unit there that is already there is a bit foolish.

The right thing to do is get it help and support!

Example: An exec who really turns out the production. Seven Esto should groove in his communicator and support lines and hat hell out of *them*.

Example: A Mimeo Section that runs like a bomb. The Esto recruits new in-trainings for it, eases its supply problems and better establishes the outside lines into it.

You keep what's established going.

New brooms may sweep clean. New Estos know their scene. And *then* establish what *isn't* established or its support lines. To do otherwise can hurt a working unit or activity.

SUMMARY

Know what disestablishes.

Then you won't accidentally tear down faster than you build up.

The hallmark of the good Esto is

ESTABLISH AND MAINTAIN.

Sometimes he is unlucky and has disestablishing going on.

Sometimes he is very lucky and only has to maintain!

HUBBARD COMMUNICATIONS OFFICE
SAINT HILL MANOR, EAST GRINSTEAD, SUSSEX

HCO POLICY LETTER OF 16 MARCH 1972
ISSUE I

REMIMEO

ESTABLISHMENT OFFICER SERIES 8

LOOK DON'T LISTEN

An Establishment Officer who stands around or sits around just talking to people or seniors is dev-t.

If these people knew what was wrong the stats would be in Power. So if they aren't, why gab?

Questions, sharp and pointed, as in an investigation, yes.

But an Esto who just talks, no.

A GOOD ESTO LOOKS.

The scene is in the hats or lack of them. The scene is on the org board or lack of it.

THE SCENE IS RIGHT BEFORE ONE'S EYES.

It is moving or it is not.

Its graphs are rising or they are level or falling or they are false or don't reflect the product or they aren't kept or they aren't posted.

Products are appearing or they are not.

Overt products are occurring or good products.

The lines are followed or they aren't.

The MEST is okay or it isn't.

It is a SCENE. It is in three dimensions. It's composed of spaces and objects and people.

They are on a right pattern or they aren't.

A person is on post or he is moving onto one or moving off or isn't there at all or he is dashing in and out.

None of these things are verbal.

Few are in despatches. Quantities of despatches, types of despatches, yes. Content? Only good for investigation, not for adjusting the lines, types and volumes.

Example: Overloaded exec. Examine his traffic. Don't *talk* to him. Examine his traffic. Look to see if he has an in-basket for each hat he wears, a folder for each type or area. Find a WHY. It can be as blunt as he doesn't know the meaning of the word "despatch." Use the WHY. Handle. Hat his communicator on comm procedures. Hat him on comm procedures. Examine his org board. Find where it's wrong. Adjust it. Get his agreement. And the load comes off and product goes up.

Now there are moments in that example when one talks. But they are concerned with ACHIEVING THE PRODUCT OF AN ESTABLISHED PRODUCING EXECUTIVE.

If the Esto doesn't himself know, name, want and get and get wanted his Product 1 (an established thing) or Product 3 (a corrected establishment) he will talk, not look. (See HCO PL 29 Oct. 70 I, Org Series 10, THE ANALYSIS OF ORGANIZATION BY PRODUCT, for Products 1, 2, 3, 4.)

You can't know what's happening in a kitchen by talking to a cook. Because he's not cooking just then. You can't know how good the food is without tasting it. You don't know really how clean a floor is without wiping at it. You don't know how clean an icebox is without smelling it.

You don't know what a tech page is really doing without watching him.

You don't know how an auditor is auditing without listening to him, looking at the pc, the exam reports, the worksheets, the date and progress of the program. If you *listened* to him, wow, one sometimes hears the greatest sessions that you ever could conceive.

To adjust a scene you have to LOOK AT IT.

ADMIN

An Esto or Esto I/C or Exec Esto who tries to do it with admin will fail.

Admin is S-L-O-W.

A product officer acts very fast if he is producing. The flurry to get a product can tear the establishment apart.

You don't halt the flurry. That's exactly counter to the purpose of an Esto.

The right answer is to ESTABLISH FASTER AND MORE FIRMLY.

It takes quickly found RIGHT Whys to really build something up.

And it isn't done by admin!

"Dear TEO. I have heard that you are in trouble with the D of P. Would you please give me a report so I can bring it up at a meeting we are holding at the Hilton next week to see if we can get people to cooperate in sending us Whys about the insolvency of the org. My wife said to say hello and I hope your kids are all right. Drop around sometime for a game of poker. Seeing you sometime. Don't forget about the report. Best. Joe, Esto I/C."

Right there you'd have a Why of org insolvency. Not any meeting. But that it's on a despatch line. TOO DAMNED SLOW.

Already establishment is slower than production. It always is. And always will be. It takes two days to make a car on an assembly line and two years to build a plant.

BUT when you make establishing even slower, you lose.

Esto admin is a splendid way to slow down establishment.

Let me give you some actual times.

1. SITUATION: Overloaded exec. Three periods of looking, each 15 to 20 minutes. Time to inspect and find WHY, and handle Mis-U word 32 minutes. Time to write cramming orders on a communicator 17 minutes. Total time to totally Esto handle: 1 hr and 49 minutes over a period of 3 days.

2. SITUATION: Investigation of lack of personnel. Collection of past records 1 hour. Location of peak recruitment period by record study 7 minutes. Location of EDs and hats of that period 35 minutes. Study of what they did. 20 minutes. Location of Why (dropped out unit) 10 minutes. Orders written as an ED to reestablish unit. Approval 9 minutes. Total Esto time 2 hours and 21 minutes. Plus time to form unit by HAS. 1 day. Unit functioning in 36 hours and got first 3 products in 2 days.

3. SITUATION: Backlog on an auditor. Inspection of lines ½ hour. Of folders of all auditors and their times in session 2 hours. Finding WHY and verifying 25 minutes (other HGC auditors dumping their pcs on one auditor because he had a slightly higher class and "they couldn't do those actions"), investigation of D of T 32 minutes (not on post, doing admin, Supers doing admin). Writing pgm 35 minutes. Locating PLs on course supervision, 1 hour. Writing cramming chits on 6 auditors, Supers and D of T 1 hour 15 minutes. Total time 6 hours and 17 minutes. Check of Why 5 days later found HGC stats up and auditor not backlogged.

4. SITUATION: Stats I/C goofing, making errors. Meter action Method 4, 18 minutes. Found word "statistic" not understood. Total time 18 minutes. Check back in 3 days, Stats I/C doing well, taking on all the duties of the hat.

5. SITUATION: Pc Admin only instant hatted. Getting her mini-hatted. M4, demos, clay demos, 4 days at 1 hour per day and 15 minute check in late day to see if she is applying it to produce what it says, 5 hours.

6. SITUATION: Exec believes all his products are overt. Three hours and 15 minutes completing 14 steps of Esto Series 5 on him, locating only one product was overt. Twenty minutes clearing up how to unbug it. Three hours and 35 minutes.

These are typical Esto situations. They are not all the types of actions Estos do. They would be typical total required time involved if the Esto were right on his toes.

I do such Esto actions. They are very rapid and effective. So what I am writing is not just theory.

Not all actions are at once successfully resolved. I have been involved in efforts to find a WHY in a very broad situation for months before all was suddenly revealed.

But where in all this was writing despatches about it?

F/N VGIs

One knows he is right when he looks and when he finds the right WHY. It's always F/N VGIs. Gung-ho! ("Pull together.")

So one isn't only looking. He is looking to see the scene and find the WHY and establish.

If the Esto has spotted and named the product he wants, then he has a comparison with the existing scene.

He cannot compare unless he looks!

Product named and wanted. Is it here in this scene? One can only see by *looking*.

You start listening and you get PR, problems, distractions, 3rd partying, etc., etc. An Esto gets into a cycle of

Outpoint, handle, outpoint, handle, outpoint, handle.

He hasn't looked and hasn't found a Why. So the scene *will get worse*.

You have then a busy, frantic Esto with the walls of Jericho falling down all over him because he listens to people blowing their own horns.

When you see an Esto standing and listening. Okay. If you see it again elsewhere. What? What? This Esto is not doing his job.

If you see an Esto standing and watching, okay. If you see him pawing through old files, okay. If you see him sitting doing a checkout, okay. If you see him working with a meter on somebody, okay. If you see him with a pile full of hats gazing into space tapping his teeth, okay. If you see him running, okay. If you see him reading policy, okay.

If you see him sitting at a desk doing admin, no, unless it's "today's chits." As a habit all day, No No No No No No.

If you see him standing talking, standing talking, give him a Dev-t Chit. He's not being an Esto.

The real tale is told when a division or an org is established so that its stats RISE and RISE.

When the staff looks happier and happier.

When the public being served is bigger and bigger and more and more thrilled.

And the Esto achieves all that by LOOKING.

A good Esto has the eye of a hawk and can see an outpoint a hundred feet away while going at a dead run.

A good Esto can find and know a real WHY in the time it takes a human being to wonder what he'll have for dinner.

A good Esto LOOKS. And he only listens so he can look.

And like Alice he knows he has to run just to keep up and run like everything to get anywhere.

And so a good Esto arrives.

L. RON HUBBARD
FOUNDER

HUBBARD COMMUNICATIONS OFFICE
SAINT HILL MANOR, EAST GRINSTEAD, SUSSEX

HCO POLICY LETTER OF 16 MARCH 1972
ISSUE II

REMIMEO

ESTABLISHMENT OFFICER SERIES 9

STUCK IN

An Esto, as well as being mobile, must not get "stuck in" on one point of a division or org.

Spending days hatting only *one* staff member and letting whole departments go is an example of what is meant by "getting stuck in."

This is why one "short cycles" an area. By that is meant doing a short start-change-stop that COMPLETES that action.

This is why one (a) instant hats, (b) gets production, (c) does a mini hat PL on the person, (d) gets production, (e) does another PL, (f) gets production.

The *produce* is a test to the Esto of whether or not he is winning on a post.

You cover your whole area as an Esto with short cycles you can complete on each person individually.

You do group drills of the whole group, little by little.

Gradient scales are at work here. (Look it up if you don't know it.)

Like, found one basic product for each in the div. Then handled other things. Then got product moved to Exchange on each one. Then did other things. Etc., etc.

The other things are find a Why for a jam area or handle a blow or any other Esto duty.

But don't spend 82 hours hatting Joe who then doesn't make it while the rest go hang.

Dev-t drops little by little and production rises IF you short cycle your actions.

Don't get "stuck in." "I've been working on Dept 1 and it is better now. Next month I go to Dept 2" is a wrong look.

Short cycles. Each staff member getting attention individually as well as a group.

If one man was totally hatted and all the rest not, they'd just knock his hat off anyway.

Don't get stuck in on a dev-t terminal. Instruct, cram, retread, dismiss is the sequence.

Short cycles work. They show up the good as well as the bad. This gives upstats a reward.

Never have a situation where a product officer can say to you, "I appreciate all the trouble you're taking getting Oscar hatted. Let me know someday when you've finished so I can stop holding the div together and get on with my product."

Little by little a whole group makes it. Drilled as a group as on org bds. Hatted on one product or a PL as an individual.

In between you work like mad to get up an org bd and groove in the new staff member or find the WHY the Exec Esto is so anxious to get.

If two days pass and a staff member has not had any individual attention, no matter how brief, from an Esto, that Esto has gotten "stuck in."

Stay unstuck!

Flow. Be mobile.

You can, you know. And be very effective too.

HCO POLICY LETTER OF 18 MARCH 1972

REMIMEO

ESTABLISHMENT OFFICER SERIES 10

FILES

The lowly and neglected item called FILES is the cause of more company downfalls than desks and quarters and sometimes even personnel.

Because files are looked upon as routine clerical work they seldom are given enough attention by executives. Yet the downfall of most executives is lack of information and FILES.

Files are often considered an area of overwork on the shoulders of one person or a part-time action. This is the most expensive "saving" an org can get itself into.

Example: One org (Joburg, early 1960s) did not have file cabinets or proper respect for files and kept losing their 6,500 Central Files of clients. The org remained in income trouble.

Example: Another org (SH 1960) would not file into its bills files or keep them up and routinely overpaid creditors. In 1964, for lack of these proper accounts files, it thought it owed £1,000 when it actually owed £22,000! And don't think *that* didn't cause management overwork!

Example: An org didn't have its CF straight and its Address was therefore incorrect and not tabbed for publics. (AOLA 1971–72) This cost thousands of dollars a week in (a) promo wasted to wrong addresses, (b) low returns, (c) insolvent cash-bills.

I could go on and on with these examples. FSM pgms broken down as Dept 18s had no proper FSM file or any real selection slip file. Inability to promote to correct publics because of no tabbed address plates. Inability to locate suppliers due to no purchaser files. No personnel obtained as personnel files nonexistent. And so on.

There are LOTS of files in an org. HCO PL 23 Feb. 70, THE LRH COMM WEEKLY REPORT,* lists the majority of these.

ORGANIZING FILES

The Establishment Officer will find all too often that in the flurry to get products, the file forming and maintenance function is bypassed. He will find files are being pawed through and destroyed by frantic staffs.

*[*Editor's Note:* HCO PL 23 Feb. 70, THE LRH COMM WEEKLY REPORT has been cancelled. The files to be kept by any division are covered in the OEC volume for that division.]

He will seldom find similar attention being given to files. He will even find local (and illegal) orders like, "They are spending too much time organizing and too little time producing. So just produce, don't organize."

Such people are getting this week's stats at the expense of all next year's income!

They even order files destroyed as "old" instead of setting up archives.

Half to two-thirds of an org's income comes from having a well kept Central Files and Address and FSM files and a lot of credit rating and correct payment comes from bills files. PL and HCOB files almost totally monitor training and processing and admin quality.

So files are FINANCIALLY VITAL TO AN ORG.

Efforts to block or cheapen files supplies and personnel must be countered. This is the first step of organizing files.

The next step is using a simple system that lets one recover things once they are filed.

The next step is collecting everything to be filed *while filing it*.

The next step is *completing* the files (usually by extra hands).

The final step is MAINTAINING the files by keeping people there to do it and having exact lines.

Independent files all over a division are liable to file out-of-date or lost. Therefore it is best to have DIVISIONAL FILES. These usually go in the last dept and section of the division. Usually every type of file in the div is kept there.

In this way you *can* keep a files person on the division's files.

A big deep FILES BASKET exists in the div comm center.

A log-out log-in book exists to locate where files have gone. This can be a large colored card that takes the place of the file.

A prefile set of boxes A–Z sits above the files and is used, so one isn't opening and closing file cabinets every time one files in one scrap of paper.

Files personnel HAVE TO KNOW THEIR ALPHABET FORWARDS AND BACKWARDS LIKE LIGHTNING. This is the biggest cause of slow or misfiling.

All hands of the division actions can be taken for an hour or two a day to catch a sudden inflow or backlog.

There are *no* "miscellaneous files" or catchall "that we put things in when we don't have another place for them."

Clerks must be able to get things out of files rapidly as well as file in.

The files location must not be so distant from the users (like Letter Reges or Accountants) that use of them is discouraged by the delay or the time lost. When this is true they start keeping their own independent files.

MEMORY

A person without memory is psychotic.

An org without files has no memory.

ESTOs

The Esto is responsible for organizing, establishing and maintaining files even when there is a Files I/C. The div head and dept heads are in command of files and their use and over files people. But this does not excuse an Esto from having the div's files established.

If an Esto only did this file action well, the increased income of an org and the decreased cost would cover his and the file clerk's pay several times over!

FILES ARE VALUABLE TO AN ORG.

HCO POLICY LETTER OF 23 MARCH 1972

REMIMEO

ESTABLISHMENT OFFICER SERIES 11

FULL PRODUCT CLEARING LONG FORM

Ref: HCO PL 13 Mar. 72

Esto Series 5
PRODUCTION AND ESTABLISHMENT
ORDERS AND PRODUCTS

MUST BE DONE ON AN ESTO BEFORE HE DOES IT ON STAFF

If you ask some people what their product is, you usually get a DOINGNESS.

There are three conditions of existence. They are BE, DO and HAVE.

All products fall under HAVE.

The oddities you will get instead of a proper product are many.

Thus it is possible to "clear products" without any real result.

PRODUCT CLEARING FORM

_____
Org

_____
Person's Name

_____
Date

_____
Post

The 14 points of Esto Series 5 are done in this fashion, with a meter used to check words.

STEP ONE

DO NOT TAKE FOR GRANTED THAT THE PERSON KNOWS WHAT "PRODUCT" MEANS. GET IT AND EVERY WORD IN THE DEFINITION LOOKED UP.

a. Clear the word PRODUCT. Dictionaries give a variety of definitions. Make sure you get a usable definition that the person understands AND WHICH HE UNDERSTANDS ALL THE WORDS IN. He can be hung up on "that" or "is" in the definition itself believe it or not. _____

b. Have the person USE the word PRODUCT ten times in sentences of his own invention and use it correctly each time. _____

c. Now clear up BE, DO, HAVE, the conditions of existence. People often think a BE is a product or a DO. It is always something someone can HAVE.

Clear the words BE, DO, HAVE by dictionary, especially HAVE. _____

d. Write these on a sheet of paper:

BE

DO

HAVE

Tell the person to name a product out in the world (a car, a book, a cured dog, etc.).

Put an arrow into the word DO if he gives you a "do," into BE if he gives you a "be" instead of a HAVE.

Mark HAVE with an arrow each time he gives a right HAVE product.

When he can *rapidly* name a product that is something that one can HAVE, without a comm lag, go on to next step. _____

e. Clear up this question on a meter Method 4 (see HCOB 22 Feb. 72, Word Clearing Series 32, WORD CLEARING METHOD 4):

Have I used any word so far you did not understand?

Get it clean. _____

f. Now give the person a copy of HCO PL 29 Oct. 70 I, Org Series 10, THE ANALYSIS OF ORGANIZATION BY PRODUCT.

Have him read the policy letter. _____

g. Clear by Method 4 Word Clearing this question:

Are there any words in the policy letter you did not understand?

Get it cleaned up. If there were any, have him reread the policy letter until he says he has it. _____

h. Drill the pc on Products 1, 2, 3 and 4.

Write:

Product 1 Product 2

Product 3 Product 4

on a sheet of paper. Let him retain and consult the HCO PL 29 Oct. 70 I, Org Series 10.

Put the point of your pen on one of the products (Product 1 or 2 or 3 or 4) and say, "Name a Product 1." "Name a Product 3." "Name a Product 4." "Name a Product 2." Do this until pc has it.

Now take the PL away from him and repeat the drill.

When your Product 1, etc., is all blacked up with ballpoint spots *and* the person is quick at it, thank him. Tell him he has it and go on to next step. _____

STEP TWO

a. Look up the hat and org board of the post of the person being product cleared and get some idea of what the post's product would have to be to fit in with the rest of the scene. It won't necessarily be in former hat write-ups. What the post produces must be worked out. Write down what it possibly may be. _____

b. Get the person to tell you what his post *produces*. Have him work the wording around until it is totally satisfactory to him and is not incorrect by Step 2a.

Be *very* careful indeed that you don't get a wrong product or you could throw the whole lineup of the org out.

Beware of "a high stat" or "a bonus" or "GI" as these are items received in exchange, not the person's produced product.

Once more resort to:

BE

DO

HAVE

to be sure he is not giving a doingness. And point this out until he actually has a HAVE.

Write down the product on the worksheet. _____

c. Ask if there are any more products to the post. If the person is wearing several hats, he would have a product for each hat.

List each hat and get the product of each hat written after it. _____

d. Now take the principal product of the post and see if it is really three products of different degrees or kinds. (Example: an auditor has [A] a well pc [one who has been gotten over a psychosomatic illness], [B] a person who is physically active and well and will continue to be well, and [C] a being with greatly increased abilities. A Super has [A] a trained student, [B] a course graduate, [C] a person who successfully applies the skills taught. Note: The above are rough wordings.)

The A, B, C you will notice fit roughly into (A) BE, (B) DO, (C) HAVE.

If the person has trouble with this, write BE, DO, HAVE on the worksheet. _____

e. Find out if the person has had these confused one with another or if he is trying for A when his product was C, or any other mix-up.

See if he has to first get a BE, then a DO to finally achieve a HAVE.

When he has all this straight he should cognite on what product he is going for on his post, with VGIs. _____

f. Tell the person that's it for the step and verify the products with a product officer. (Be sure it's a product officer who has had his Product Clearing. If this is THE product officer of the org, see if it compares to the valuable final products of an org [see HCO PL 8 Nov. 73RA, Rev. 9 Mar. 74, THE VFPs AND GDSes OF THE DIVISIONS OF AN ORG*].)

If the products are not all right check the person on a meter for Mis-Us and do Steps 1 and 2 again. If okay, proceed to Step 3. _____

STEP THREE

a. Give the person HCO PL 27 Nov. 71 I, Executive Series 3, Finance Series 6-1, MONEY and HCO PL 3 Dec. 71, Executive Series 4, Finance Series 6-2, EXCHANGE. Have him read them. _____

b. Return and do Method 4 on the PLs and clean up any misunderstood word. If these are found and looked up and used, then have the person read the PLs again. _____

c. Now that the person has it, exchange objects with him.

Have him now explain exchange until he sees clearly what it is. _____

*[*Editor's Note:* HCO PL 8 Nov. 73RA, Rev. 9 Mar. 74, THE VFPs AND GDSes OF THE DIVISIONS OF AN ORG was later cancelled and the data on VFPs can now be found on the org board provided with OEC Volume 0.]

STEP FOUR

a. Now write his product on the left-hand side of your worksheet and draw an arrow from it to the right:

His product ——————→

And one to the left below it

←——————

Have him tell you what, *internally* in the org, he could get in *exchange* for producing his product and getting it out.

Have him clear up why he might not get that. _____

b. Have him look at a worksheet picture:

	Overt Act	——→	Injury
	Injury	←——	Overt Act
SELF	No Product	——→	OTHERS
	Nothing	←——	Nothing

as a cycle. Be sure he grasps that. _____

c. Have him look at a worksheet picture:

Overt Product	——→	Upset
Upset	←——	Overt

And have him grasp that cycle. _____

d. Now have *him* draw various such cycles having to do with the products he has been getting out. Such as:

Bad Product	——→	Dissatisfied
Bad Feelings	←——	Ethics

But using various versions of products.

Do this until he has it untangled and feels good. _____

e. Have him write down his product on the left, arrow to the right, what comes back on the right and what occurs on the left.

If he has this now, tell him that's fine. _____

STEP FIVE

(All in Big Clay Demos)

a. Have him work out what theft is in terms of exchange, and arrows. _____

b. Have him show how his product contributes to the org's product. _____

c. Have him work out how the org's product as relates to his division is then exchanged with society outside the org and Scientology and what society exchanges back to the org. _____

d. Have him work out how his product contributes to org's product outward and outside the org and Scn and then from the society outside back to the org and org back to him.

This may have more than two vias each way. _____

e. Have him work out the combined staff products into an org product and then out into the society and then the exchange back into the org and to CLOs and upper management and to org staff. _____

f. When the demos are all okay and BIG, tell him that's fine and go on to next step. _____

STEP SIX
(Metered)

a. Find out if person wants his *product*? (not the exchange).

If not, find out who might suppress it? and E/S times.

Who might invalidate it? and earlier times.

Two-way comm it to F/N cog VGIs. _____

b. Establish now if the person wants his product. _____

(If bogs turn over to a C/S and auditor for ruds and completion.)

STEP SEVEN
(Metered)

a. Can the person get his product out?

Handle by two-way comm E/S to F/N. _____

STEP EIGHT
(Metered)

a. What will his product be in volume?

Is that enough to bother about or will it have to be in greater volume?

What would be viable as to volume?

Clean up RUSHED or failures.

To F/N cog VGIs. _____

STEP NINE

(Metered)

a. What quality would be necessary?

Get various degrees of quality stated.

What would he have to do to attain that quality?

What volume could he attain?

What would he have to do to attain that?

To F/N cog VGIs. _____

STEP TEN

(Metered)

a. Can he get others to want the products he put out?

What would he have to do to attain this? _____

STEP ELEVEN

(In BIG Clay)

(This is a progressive clay demo added to at each step.)

a. How does his product or products fit into the framework of his section? Requires he work out the section product if his is not it. Then fit his to it. _____

b. How does his product fit into the department? Requires he work out the department's product and fit his to it if his is not the dept's product. _____

c. How does his product fit into the division's products? He will have to work out the div's product or consult HCO PL 8 Nov. 73RA, Rev. 9 Mar. 74, THE VFPs AND GDSes OF THE DIVISIONS OF AN ORG. _____

d. How does the division's product exchange with the public? And for what? _____

e. What happens to the org on this exchange? _____

STEP TWELVE

(In Big Clay)

a. What blocks might he encounter in getting out his product? _____

b. What can HE do about these? _____

STEP THIRTEEN

(Two-way Comm)

a. What does he have to have to get his product out? (Beware of too much have before he can do. Get him to cut it back so *he* is more causative.) _____

STEP FOURTEEN

(Written by Pc)

a. What is his product on the 1st dynamic — self?
How does it fit in with what he is doing? _____

b. What is his product on the 2nd dynamic — family and sex?
How does it fit in with what he is doing? _____

c. What is his product on the 3rd dynamic — groups?
How does it fit in with what he is doing? _____

d. What is his product on the 4th dynamic — mankind?
How does it fit in with what he is doing? _____

e. What is his product on the 5th dynamic — animal and vegetable kingdom?
How does it fit in with what he is doing? _____

f. What is his product on the 6th dynamic — the universe of matter, energy, space and time?
How does it fit in with what he is doing? _____

g. What is his product on the 7th dynamic — beings as spirits — thetans?
How does it fit in with what he is doing? _____

h. What is his product on the 8th dynamic — God or the Infinite or religion?
How does it fit in with what he is doing? _____

i. What is his post product? _____

j. Can he get it out now? _____

_____
Esto or Product Clearer

Note this long form has to be run on leading executives and eventually on all staff. The short form in Esto Series 5, HCO PL 13 Mar. 72, PRODUCTION AND ESTABLISHMENT, ORDERS AND PRODUCTS, 14 points, serves as a rapid action.

Where there is any hang-up on the short form, send the person to an auditor. Where there is a hang-up on the long form, send the person to an auditor. The auditing action is to fly ruds on the RD and assess any key words the pc is upset about and do an 18 button Prepcheck *carrying* each prepcheck button to F/N.

TA

Where the TA is already high do not attempt the short or long form.

Where the person turns on a rock slam check for rings on the hands. If so, remove rings. Note if R/S continues.

In either case the person should be programed for TA trouble with C/S 53RRR and handled, and then given a GF 40RR Method 3 (F/Ning each question that reads) and then running the engrams with drugs run first.

Product Clearing is best done after Word Clearing No. 1 is successfully done.

An Esto who can use a meter and Method 4 W/Cing and knows clay demoing can do it.

HCO Bulletins are planned to be issued on this RD to handle it on rough ones or repair it as needed in the hands of an expert auditor.

FOUNDER

HUBBARD COMMUNICATIONS OFFICE
SAINT HILL MANOR, EAST GRINSTEAD, SUSSEX

HCO POLICY LETTER OF 1 APRIL 1972

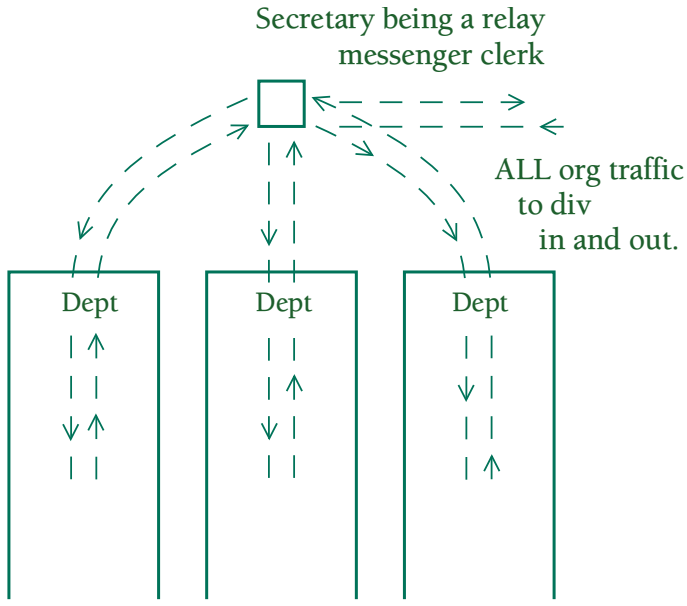
REMIMEO

EXECUTIVE SERIES 11
ESTABLISHMENT OFFICER SERIES 12

MAKING AN EXECUTIVE

FLOW LINES

If an executive has his flow lines wrong he will NEVER be a product officer but only a comm clerk.



For some poor reason executives get themselves onto all comm lines in their area. Probably it is an individual Why for each one. But the fact remains that they *do* do it!

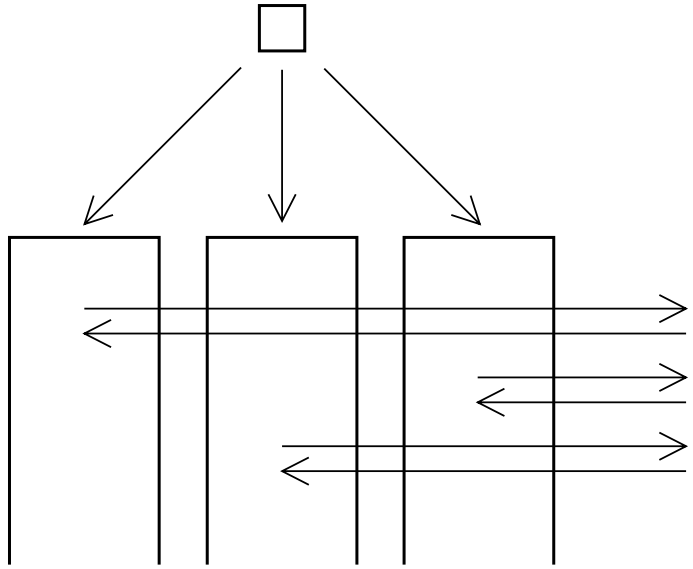
And they promptly cease to be useful to anyone. While they "work" like mad!

Basically *they have confused a comm line with a command line.* These are two different things. A comm line is the line on which particles flow, it is horizontal. A command line is a line on which authority flows. It is vertical.

Here is an example of a divisional secretary who can get nothing accomplished while sweating blood over her "work."

Wrong

Now quite obviously this secretary is suffering from "fear of juniors' actions" or "having to know all." Exactly nothing will happen because the person is plowed under with paper. No real actions are taken. Just relays.



One such secretary of a division even acted as the relay point on all out and in BODY traffic. In short, just a divisional receptionist.

No product. Nothing happening at vast expense.

Here is another example. The correct one.

Div secretary as product officer

Right

This is known as horizontal flow.

It is a fast flow system.

The correct terminals in each department are addressed by terminals outside the dept, directly. And are so answered.

Now we have a divisional secretary who is a PRODUCT OFFICER and whose duty is to get each department and section and unit producing what it is supposed to produce.

MISROUTE

So long as a command line is confused with the comm line an org will not produce much of anything but paper.

INFORMATION

It *is* vital that an executive keep himself informed.

The joker is, the despatch line does NOT keep him informed. It only absorbs his time and energy.

The data is not in those despatches.

The data an executive wants is in STATISTICS and REPORTS and briefings.

Statistics get posted and are kept up-to-date for anyone to look at, especially but not only the executive. They must ACCURATELY reflect production, volume, quality and viability.

Reports are summaries of areas or people or situations or conditions.

The sequence is (a) statistic goes unusually high, (b) an inspection or reports are required in order to evaluate it and reinforce it.

Or (a) the statistic dives a bit and (b) an inspection or reports are needed to evaluate and correct it.

Thus an executive is NOT dealing with the despatches or bodies of the division's inflow and outflow lines but the facts of the division's production in each section.

An executive makes sure he has comm lines, yes. But these are so he can make sure stats get collected and posted, so reports can be ordered or received and so he can receive or issue orders *about these situations.*

Despatchwise that is all an executive handles.

INSPECTIONS

Personally or by representative, an executive INSPECTS continually.

His main duties are:

OBSERVATION

EVALUATIONS (which includes handling orders)

and SUPERVISION.

All this adds up to the production of what the division is supposed to produce. Not an editing of its despatches.

A good executive is all over the place getting production done.

On a product he names it, wants it, gets it, gets it wanted, gets in the exchange for it.

He cannot do this without doing OBSERVATION by (1) stats, (2) reports, (3) inspections.

And he can't get at what's got it bugged without evaluation. And he can't evaluate without an idea of stats and reports and inspections.

Otherwise he won't know what to order in order to SUPERVISE. And once again he supervises on the basis of what he names, wants, gets, gets wanted and gets the exchange for.

THE SCENE

This *is* the scene of an executive.

If he is doing something else he will be a failure.

The scene is an active PRODUCTION SCENE where the executive is getting what's wanted and working out what will next be wanted.

ABILITY

An actual executive *can* work.

A real fireball can do any job he has getting done under him better than anyone he has working for him or under him.

He can't be kidded or lied to.

He *knows*.

Thus a wobble of a stat has him actively looking in the exact right place. And evaluating knowingly on reports. And getting the exact right WHY. And issuing the exact right orders. And seeing them get done. And knowing it's done right because he knows it can be done and how to do it.

Now that's an ideal scene for an exec.

But any exec can work up to it.

If he does a little bit on a lower job each day, "gets his hands dirty" as the saying goes, and masters the skill, he soon will know the whole area. If he schedules this as his 1400 to 1500 stint or some such time daily, he'll know them all soon. And if he burns the midnight oil catching up on his study.

And he *knows* he must watch stats and then rapidly get or do observations, so he can evaluate and find real Whys quickly and get the correction in and by supervision get the job done.

That's the ideal scene for the exec himself where he's head of the whole firm or a small part of it.

If he can't do it he will very likely hide himself on a relay despatch line and appear busy while it all crashes unattended.

An exec of course has his own admin to do but they don't spend hours at it or consider it their job for it surely isn't. Possibly an hour a day at the most handles despatches unless of course one doesn't police the dev-t in them.

Most of their evaluations are not written. They don't "go for approval" when they concern somebody's post jam. They are done by investigation on the spot and the handling is actual, not verbal.

A desk is used (a) to work out plans, (b) catch up the in-basket, (c) interview someone, (d) write up orders. Two-thirds of their time is devoted to production. Even if a thousand miles away they still only spend one-third of their time on despatches.

An executive has to be able to produce the real products and to get production. That defines even an Esto whose product has to do with an established person or thing.

Any department, any division, any org, any area responds the same way—favorably—to such competence.

ANALYSIS

To attain this ideal scene with an executive, one can find out WHY he isn't, by getting him to study this PL and then find WHY he can't really do it and then by programing him to remedy lack of know-how and other actions, increase his ability until he is a fireball.

If you are lucky you will have a fireball to begin with. But only the stats and *the truth of them* tell that!

Esto action: Can you do all this and these things? If the answer is no or doubtful or if the executive isn't doing them, find the Why and remedy.

L. RON HUBBARD
FOUNDER

HUBBARD COMMUNICATIONS OFFICE
SAINT HILL MANOR, EAST GRINSTEAD, SUSSEX

HCO POLICY LETTER OF 3 APRIL 1972

REMIMEO

ESTABLISHMENT OFFICER SERIES 13

DOING WORK

The basic Esto problem is getting somebody to do his job.

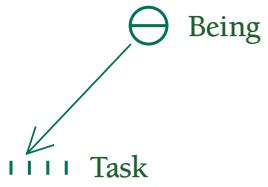
This is not just executives nor "bad staff." It tends to be rather prevalent in our modern culture.

The basic question really is, "Why can't you do what you are supposed to be doing?"

An Esto will find many people "busy," but really not doing their post hat.

As the Esto's own stat depends on people actually doing their jobs, and as the pay and well-being of those people also depend on it, it amounts to quite a problem.

You can do a Product Rundown to cognitions. But then in some cases nothing happens.



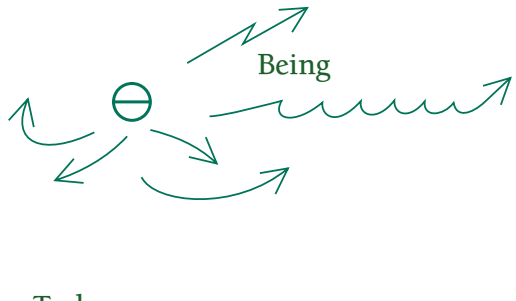
You hat and still nothing happens.

ABERRATION

To understand this you have to understand "aberration."

Get the idea of a being doing wholly what he is doing. You get this:

A.



It is a *straight* line of attention.

Now get the idea of somebody "doing a job that is not doing what he is doing."

We get

B.

This is aberration. Which means "not in a straight line."

So in example (A), the person *does* what he is doing.

In example (B), he is doing but he is not doing what he is doing MENTALLY. Mentally he is doing something else while he is doing what he *seems* to be doing.

SCHIZOPHRENIA

The most prevalent "mental disorder" is supposed to be schizophrenia. This means "SCISSORS" or 2 plus "head." A two-head in other words. And in this case two heads are not better than one (joke).

You see this in institutions. A person is changing valences (personalities) click-click-click, one to the next.

But the condition is a gradient one that worsens between sanity and the bottom of the scale.

Midway, the condition is common but almost never noticed. It is so common today that it passes as normal humanoid.

The person is not doing what he is doing.

Examples of this are: people who do not like a job with responsibility because they "like to do mechanical things so they can dream of something else while working"; persons who "have to do something else before they can _____"; persons who are out of area; persons who continually make dev-t.

There is also the person who rams sideways into the work of others with "mistakes," "demands," and prevents them from doing what they are doing while himself not doing what he is doing.

One can't say these people are crazy. Not today. But one can say they make problems which are very difficult unless you know how to unlock the riddle.

BARRIERS

Study Series 2, HCOB 2 June 71 I, CONFRONTING, and the drills given in the Esto tape series can push their way through an astonishing mass of barriers.

For this is what the condition is — an effort to get through barriers.

The reason example (B) above occurs is that the person's attention is misdirected by mental barriers each time he tries to do (A) above.

Yet only if he can do (A) will he have any self-determinism and power.

It does not mean he is crazy. It means he is incapable of directing his attention straight. Each time he does, he hits something that deflects it (sends it off at an angle).

All this will seem very reasonable to him because it is the way it has always been. And like the little girl who never knew she had had a headache from the time of birth, and only knew it when it quit suddenly, such a person does not realize he cannot control his attention.

Such think about lots of other things while apparently thinking about what they are doing. And they do lots of other things.

MISUNDERSTOODS

Misunderstood words prevent them being in communication with materials or others. Thus they do not *read* or *listen*. They maunder (which means wander about mentally).

This is the inflow side of it.

The outflow side are barriers of odd fears and peculiar ideas.

Such people appear rather weak and dispersed. Or too heavy and stubborn to make up for it.

They have fixed ideas and other outpoints because their thoughts *detour* instead of running along a highway.

HAPPINESS

To get someone to actually do what he is doing when he is doing it will sound cruel to some people. That's because they find it painful to confront and would rather withdraw and maunder, sort of self-audit themselves through life.

They are not happy.

Happiness comes from self-determinism, production and pride.

Happiness is power and power is being able to do what one is doing when one is doing it.

COMPETENCE

When a person is competent, nothing can shake his pride. The world can yell. But it doesn't shake him.

Competence is not a question of one being being more clever than another. It is one being being more able to do what he is doing than another is.

Example (A) is competence.

Example (B) is incompetence.

MORE THERE

You could say a competent person was "more there." But this is really "more able to put his attention on what he has his attention on."

WHY

Anyone who is not a fireball on his post could be described by this WHY:

Unable to do his post for an individual WHY for each person.

Thus there are two ready remedies an Esto can use.

1. He can find the WHY a person cannot do his post, and then handle it.

2. He can do Esto drills on the person.

In finding the WHY, the observation itself that his stats are low may find the person a bit defensive.

It just could be that he *does* do what he is doing. But if so his stats would be high and he would be moving fast.

Thus one has to find his personal WHY. If it is the right one he should have very good indicators and speed up and do his job. If it is not quite the right one he may feel degraded or ashamed.

The test of any right WHY is does it raise the existing scene toward the ideal with existing resources.

Thus you can get a WHY that is not wholly acceptable until handled. But if you really are spot on it should blow a lot of the barriers.

Thus a real WHY blows a lot of the barriers, when handled, between the being and his job.

The drills then push it on through.

The drills sometimes blow through the WHY. The WHY sometimes blows right through any need of drills.

So these two actions interact.

If you see someone feeling very guilty after the WHY "is found," better check it over. It could be a wrong Why, and in this case, just find a new one.

THIRD ACTION

The Primary Rundown, HCOB 30 Mar. 72, should be done on a staff member thoroughly.

Otherwise he will remain to some degree out of comm. He will not be able to take in data quickly if he cannot communicate with words.

Of course processing removes *all* the barriers eventually. But it is not necessarily aimed at doing a job.

Ability potential is enormously increased by processing.

But traditionally we do not rely on processing to handle staff.

We handle people and we handle cases.

But auditors and staff members, simply because we *do* handle people and cases, must not have cases on post. We do not admit that they have cases. This raises necessity level.

And it is quite amazing how high that necessity level can be raised and how a person can function despite his case.

If we admitted that staff had cases, we couldn't handle public cases. It's that simple.

So an Esto does not advise or use auditing on staff members as a post remedy nor accept case as a WHY.

Of course "case" is a Why. But when you accept it you retreat from example (A) above and at once get a (B).

You will be amazed how a person can begin to do what he is doing by finding his Why and doing drills.

And of course you also have to handle the fellows who jam in from the side at every turn and disperse the staff member's attention. He too (and especially) isn't doing what he is doing.

The same procedure (Why and drills) handles him as well.

In sum, if a staff member isn't doing what he is doing he is doing something else. They never do nothing.

Ask, "What is the reason you do not fully do your post?" or any such version. Find the real WHY. And handle the person.

That's the major part of an Esto's job.

And don't be surprised if you get a cheerful "but I am!" And find he is.

But his stats and speed tell the whole story.

REMIMEO

ESTABLISHMENT OFFICER SERIES 14

ETHICS

The normal level of an unhatted, dev-t, nonproducing org is out-ethics.

The reason you see so many heavy ethics actions occurring — or situations where heavy ethics actions should occur if they aren't — in such an org is that it has its EXCHANGE flows messed up.

It is important to know this fact as this factor alone can sometimes be employed to handle persons in the area whose ethics are out.

CRIMINALITY

Unless we want to go on living in a far nowhere some of the facts of scenes have to be confronted.

An inability to confront evil leads people into disregarding it or discounting it or not seeing it at all.

Reversely, there can be a type of person who, like an old-time preacher, sees nothing but evil in everything and, possibly looking into his own heart for a model, believes all men are evil.

Man, however (as you can read in HCOB 28 Nov. 70, C/S Series 22, PSYCHOSIS), is basically good. When going on some evil course he attempts to restrain himself and caves himself in.

The Chart of Human Evaluation in *Science of Survival* was right enough. And such people also can be found by the Oxford Capacity Analysis where the graph is low and well below a center line on the right.

This sort of thing can be handled of course by auditing but the Esto does not depend on that to handle his staff's problems.

Criminal actions proceed from such people *unless checked* by more duress from without not to do an evil act than they themselves have pressure from within to do it.

Criminality is in most instances restrained by just such an imbalance of pressures.

If you have no ethics presence in an org, then criminality shows its head.

Such people lie rather than be made to confront. They false report — they even use "PR," which means public relations, to cover up — and in our slang talk "PR" means putting up a lot of false reports to serve as a smoke screen for idleness or bad actions.

Unless you get ethics in, you will never get tech in. If you can't get tech in, you won't get admin in.

So the lack of ethics permits the criminal impulse to go unchecked.

Yes, it could be handled with tech. But to get money you have to have admin in.

Unless there is ethics and ways to get it in, no matter how distasteful it may seem, you will never get tech and admin in.

Of course there is always the element of possible injustice. But this is provided against. (See HCO PL 24 Feb. 72 I, INJUSTICE.)

When ethics is being applied by criminal hands (as happens in some governments) it can get pretty grim.

But even then ethics serves as a restraint to just outright slaughter.

Omitting to handle criminality can make one as guilty of the resulting crimes as if one committed them!

So criminality as a factor has to be handled.

It is standardly handled by the basic ethics PLs and the Ethics Officer system.

EXCHANGE

The unhatted, unproducing staff member, who is not really a criminal or psychotic, can be made to go criminal.

This joins him to the criminal ranks.

The ethics system also applies to him.

However there is something an Esto can do about it that is truly Esto tech.

This lies in the field of EXCHANGE.

If you recall your Product Clearing, you will see that exchange is something for something.

Criminal exchange is nothing from the criminal for something from another.

Whether theft or threat or fraud is used, the criminal think is to get something without putting out anything. That is obvious.

A staff member can be coaxed into this kind of thinking by

PERMITTING HIM TO RECEIVE WITHOUT HIS CONTRIBUTING.

This unlocks by the way an age-old riddle of the philosophers as to "what is right or wrong."

HONESTY is the road to SANITY. You can prove that and do prove it every time you make somebody well by "pulling his withholds." The insane are just one seething mass of overt acts and withholds. And they are very physically sick people.

When you let somebody be dishonest you are setting him up to become physically ill and unhappy.

Traditional Sea Org ethics labeled noncompliance as Liability and a false report as Doubt.

And it's true enough.

When you let a person give nothing for something, you are factually encouraging crime.

Don't be surprised that welfare districts are full of robbery and murder. People there give nothing for something.

When *exchange* is out the whole social balance goes out.

Every full scholarship ever given by an org wound up in a messy scene.

When you hire a professional pc who just sits around making do-less motions while people audit him and contribute to him DO NOT BE SURPRISED IF HE GETS SICKER AND SICKER.

He is contributing nothing in return and winds up in overwhelm!

Similarly if you actively prevented someone from contributing in return, you could also make him ARC broken and sick.

It is EXCHANGE which maintains the inflow and outflow that gives a person space around him and keeps the bank off of him.

There are numbers of ways these flows of exchange can be unbalanced.

It does not go same out as comes in. Equal amounts are no factor. Who can measure goodwill or friendship? Who can actually calculate the value of saving a being from death in each lifetime? Who can measure the reward of pride in doing a job well or praise?

For all these things are of different values to different people.

In the material world the person whose exchange factor is out may think he "makes money." Only a government or a counterfeiter "makes money." One has to produce something to *exchange* for money.

Right there the exchange factor is out.

If he gives nothing in return for what he gets, the money does not belong to him.

In Product Clearing many people it was found that some considered their food, clothing, bed and allowance were not theirs because they produced. They were theirs "just by being there." This funny "logic" covered up the fact that these people

produced little or nothing on post. Yet they were the first to howl when not getting expensive (to the org) auditing or courses or tech!

Thus such a person, not hatted or made to produce, will get ill.

It is interesting that when a person becomes productive his morale improves.

Reversely it should be rather plain to you that a person who doesn't produce becomes mentally or physically ill. For his *exchange* factor is out.

So when you reward a downstat you not only deprive upstats, you also cave the downstat in!

I don't think welfare states have anything else in mind!

The riots of the ancient city of Rome were caused by these factors. There they gave away corn and games to a populace that eventually became so savage it could only enjoy torture and gruesome death in the arena!

A lot of this exchange imbalance comes from child psychology where the child is not contributing anything and is not permitted to contribute.

It is this which first overwhelms him with feelings of obligation to his parents and then bursts out as total revolt in his teens.

Children who are permitted to contribute (not as a cute thing to do but actually) make noncontributing children of the same age look like raving maniacs! It is the cruel sadism of modern times to destroy the next generation this way. Don't think it isn't intended. I have examined the OCAs of parents who do it!

So if a person is brought up this life with the exchange all awry, the Esto has his hands full sometimes!

He is dealing with trained-in criminality!

WHAT HE CAN DO

The remedy is rather simple.

First one has to know all about EXCHANGE as covered in the Product Clearing policy letters.

Then he has to specially clear this up with people who do not produce.

He should get them to work on it as it relates to ALL THEIR DYNAMICS IN RELATIONSHIP TO EVERY OTHER DYNAMIC.

That means he has to clear up the definitions of dynamics with *care* and then have the person draw a big chart (of his own) and say what he gives the first dynamic and what it gives him. Then what he gives the second dynamic and what it gives him. And so on up the dynamics.

Now, have him consider "his own second dynamic." What does his second dynamic give his first dynamic? What does his second dynamic give the second dynamic and what does it give him?

And so on until you have a network of these exchange arrows, each both ways.

Somewhere along the way, if your TRs are good and you have his attention and he is willing to talk to you, he will have quite a cognition!

That, if it's a big one, is the end phenomena of it.

And don't be surprised if you see a person now and then change his physical face shape!

CONDITIONS BY DYNAMICS

An ethics-type "action" can be done by giving the person the conditions formulas (pages 383, 438, 442, 443, 444, 445 of Vol 0, Basic Staff Hat. HCO PL 14 Mar. 68 — page 437 — gives one the table.)

Method 4 the person on the table of conditions and pick up any other misunderstoods.

Have the person study the *formula* of each of these conditions in the table so that he knows what they are and what the formulas are.

When he has all this now with no misunderstood words you must clear up the words related to his dynamics 1 to 8 and what they are.

Now you're ready for the billion-dollar question.

Ask him what is his condition on the first dynamic. Have him study the formulas. Don't buy any glib PR.

Don't evaluate or invalidate. When he's completely sure of what his condition really is on the first dynamic he will cognite.

Now take up the second dynamic by its parts — sex, family, children. Get a condition for each.

Similarly go on up each one of the dynamics until you have a condition for each one.

Now begin with the first dynamic again.

Continue to work this way.

You will be amazed to find he will come out of false high down to low and back up again *on each dynamic*.

Somewhere along the line he will start to change markedly.

When you have a person in continual heavy ethics or who is out-ethics (ethics bait, we say) and who is floundering around, you can do an S&D on him and quite often save his future for him.

When you have such a person you do this one first before you do the Exchange by Dynamics.

In other words, you use this on "ethics bait" and then when he's come out of such, you do Exchange by Dynamics on him.

SUMMARY

When all looks black, and you are getting false reports, and the things said done were not done and what was really being done were overt products and despite all your work the stats just *won't* go up, you still have three answers:

1. GET IN ETHICS ON THE ORG.
2. GET EXCHANGE DONE ON INDIVIDUALS.
3. GET IN CONDITIONS BY DYNAMICS ON THE ETHICS BAIT.

And after that keep a strong, just Division 1 Dept 3.

You'll be amazed!

ESTABLISHMENT OFFICER SERIES 15

PRODUCT CORRECTION

If you find the wrong product for a post, you knock the staff member's hat off.

Example: Get the janitor a product of "a well-established business" and he's the Exec Esto!

When all the "products" have been "found" you can have bits of trouble here and there. This would be very mysterious unless you realize that a certain percentage of products found will be:

a. Incorrect,

b. Too few,

c. Incompletely worded,

d. Are doingnesses not havingnesses,

e. Can't be worked into a stat.

There will also be a certain small number who were upset by a poor Product Rundown and will have to have auditing to handle (usually the bypassed charge list L1C on the Product Rundown or what is called a Green Form or even a Word Clearing Correction List).

The majority probably will be all right, so that's a pluspoint.

But these flubbed rundowns become themselves a Why.

So let's see how to correct one.

1. **Did the product add up to a havingness?** _____

2. **Was it exchangeable?** _____

3. **Did it match the actual hat?** _____

4. **Were there more for the same post?** _____

5. **Is the person really wearing several hats, each of which has a product?** _____

6. If more than one found did they go together with each other? _____
7. Does it give the person a different hat? _____
8. Did it give the person somebody else s hat? _____
9. Were there misunderstood words in the rundown? _____
10. Does the person have contrary orders from some other person? _____
11. Was it just an exercise to the person? _____
12. Did doing the rundown make the person ARC broken or otherwise put ruds out? _____
13. Didn t the person agree with it? _____
14. Was the person really trying to do some other job? _____
15. Was the person about to leave present post or wanted to? _____
16. Was the Product Rundown really not done? _____
17. Is the person unhappy on post? _____
18. Is the person taking illegal orders? _____
19. Is the person connected to antagonistic people (PTS)? _____
20. Wrong post for the product? _____
21. Wrong org board? _____
22. Crossed over into another department? _____
23. Crossed over into another division? _____

The questions, assessed on a meter, should be handled if they read.

And when that is done (assessed and handled), the door is open to finding the Why called for in Esto Series 13. The above questions could be the Why or part of it but usually that's just a symptom of the real Why called for in Esto Series 13.

But in any event the questions correct the Product Rundown and it's vital to do that.

HATS AND ORG BOARD
EXISTING ORG BOARD

The routine action with a post is to get the person to list on separate cards WITH CORRECT EXACT WORDING each hat the person wears or has been wearing no matter how small. This is NOT copied from a PL. It's an honest "What hats do you really wear?"

The list may be as long as 35 or 40! The higher you go on the command channel, the more of these hats.

Having done that for every member in a division, you wind up with either:

1. Completely expressed division hats or
2. Woefully missing functions or
3. Badly adjusted workloads.
4. A totally cross-hatted scramble.

You put these cards (identified as whose by the writing) onto a blank org board. You now have AN EXISTING ORG BOARD.

NEXT ACTION

The following is an entirely separate action.

Now you take the 1965 org board or FEBC org board or whatever org board is a model and see if the "hats" you have go under the functions listed on the board.

You adjust the hats around to cover the actual functions of the division.

You write up cards to cover the missing functions.

You put these new cards on the org board.

FUNCTION BOARD

You write up the *functions* of the org board of the division by departments on a separate model and add the valuable final products per HCO PL 8 Nov. 73RA.*

This gives you the functions to get out the VFPs expected.

These functions will or won't get out the VFPs.

What *functions* are needed to get them out?

By blocking in these, you have now a FUNCTION ORG BOARD.

TITLES ORG BOARD

From this function org board you can now make up a TITLES ORG BOARD.

Each title has some of these functions. The functions must be of the same general type for the title.

When you have done this (with divisional secretary, divisional org officer and divisional Esto and department heads), you now have a TITLES ORG BOARD.

*[*Editor's Note:* HCO PL 8 Nov. 73RA, Rev. 9 Mar. 74, THE VFPs AND GDSes OF THE DIVISIONS OF AN ORG was later cancelled and the data on VFPs can now be found on the org board provided with OEC Volume 0.]

POSTING

The main failure in putting names on an org board is that people take the easy way out and try to put a different person's name on each title. This gives you a 100-person division "absolutely vital" while the production is about 5 man!

You take the names you have NOW in the division and post those to cover all the functions and titles.

You post from the top down. YOU NEVER POST FROM BOTTOM UP. And you NEVER LEAVE A GAP BETWEEN PERSONS ON LOWER POSTS AND HIGH POSTS. Either of these faults will raise hell in the division's functioning and are grave faults.

Having done this, you now have a POSTED ORG BOARD.

MATCHING

Now the hat lists you have are probably wildly different than your posted org board.

Take the cards of hats they were wearing and try to fit these onto your POSTED ORG BOARD.

You now at once "before your very eyes" will see what's wrong with your product and what might be right with it.

You will have one of these:

1. Completely expressed division hats
2. Woefully missing functions
3. Badly adjusted workloads OR
4. A function not on the POSTED BOARD but done by someone that is getting the product!

You will see that the board, made from the hat cards they wrote, doesn't usually compare with your posted org board!

AND THAT'S A POSSIBLE WHY YOU COULDN'T GET PRODUCT RUNDOWNS DONE!

Hats don't add up to product. Or the actions really being done are totally unproductive.

You now have it before your eyes.

CAUTION

By an excess of purity you can crash a division or an org by removing a key function someone is doing that's NOT on the posted org board *but* IS getting the product!

We had a Phone Reg recently removed because he wasn't allowed for on the org board and "had to be Dir Reg but wouldn't." When he was *forced* into line, the stats promptly crashed!

The stats recovered promptly when his removal was spotted and he was ordered back on post.

You don't juggle an org board lightly. You can destroy a division or unit by juggling hats.

The rule is DON'T DISMANTLE A WORKING INSTALLATION. NEVER!

You can build around it, support it, put in another one like it. But don't touch it!

It is heartbreaking to build a successful upstat division — takes months — and have somebody crash it by musical chairs, musical functions.

So always look at stats. And look at the PAST points of high stats of that div in past years and see what was its organization when it was *really* upstat.

You could do no better than to rebuild that old structure.

But if your div or activity was a working installation that was really getting out the product, don't monkey with it. Study it instead.

RECLEARING PRODUCT

If Product Clearing wasn't good, and the unit isn't doing well, then do the above org board exercises to see what gave.

And you probably will now see that you didn't have the right products.

Try to get your division or dept standard if its stats are low. Standard is your 1965 SH org board for a big org. That org really ran! Most policy is built on it.

But a little org builds up from "Org Program No. 1," LRH ED 49 Int, 9 Dec. 69. And can go through the 6-dept stage of London, LA and DC in their glory (56–62). They had an HCO, a Registration, Accounts, Training, Processing and a Department of Personnel Efficiency (public).

These did all the functions. There was an HCO Sec and an Association Sec. But Org Program No. 1 phases into it with a person in full charge of public.

Or a little org can build a big org from Org Program No. 1 right on into the 65 org board.

The *approximate* products of HCO PL 8 Nov. 73RA are being worked for. I say approximate as there may be more and the wording may be better adjusted.

When you have the hats getting out the subproducts (those necessary to make the VFPs of the org) you will get the VFPs.

CORRECTED ORG BOARD

You may find it necessary to correct your posted org board to get the VFPs.

Remember, it has the staff it has, plus any new ones it manages to get plus any field technical persons it can get in to go on staff.

YOU HAVE TO SET IT UP TO GET OUT THE VFPs NOW NOW NOW.

An org can't stand idle to be organized. It can die if it is halted just to establish.

So you post the people you have to do the functions that must be done.

Then you Product Clear.

You clear from the top down.

You HAT *to produce*.

There isn't anything more important than this step.

EASY WAYS

The easy way to do this is to do two of the short form steps quickly on EACH staff member from the top down.

Then take the next two on ALL the staff, each one.

If a Product Rundown has been done already but it isn't running well, correct it, with above list.

And do it with two steps and go on to the next staff member.

NEGLECTING TO CLEAR PRODUCTS

The biggest omission is not clearing products at all.

The next biggest omission is failing to clear from the top down.

The next is not clearing them all through the div two at a time.

The next is not clearing products on the new people coming into the div promptly.

CRISSCROSSING PRODUCTS

A div can be tangled by having the wrong products for the hats.

So product is always suspect when stats are down or lines tangle.

BIGGEST WHY

The biggest Why of products not getting cleared is an Esto I/C in a small org or an Exec Esto who does not run and train his Estos. If an Exec Esto listens to "but I can't use a meter," "my TRs are out," "she won't let me hat her," "I have Mis-Us on the PLs so don't read them" and does not handle his Estos the way a coach handles a hot football team, products won't get cleared.

Naturally if products are not cleared on an Esto I/C or an Exec Esto or if they aren't cleared on the Estos, they will flounder.

Once again it's a two-step at a time action round and round while getting other things done between each two steps.

EXAMPLE OF PRODUCTS

An example of Product Clearing that throws things out is crossing the hats of the Esto MAAs.

The Exec Esto's MAA is responsible for the schedule and getting to work and exercise and activities of STAFF MEMBERS.

The Assistant Esto MAA is responsible for Estos.

If their products are incorrectly cleared they will flounder around and their posts may look of little value.

The Exec Esto's MAA probably has a product like "effective post hours of each staff member." Each staff member on post one hour is a product. He also therefore has a welfare sort of function that leads to a lesser product that leads to the main one. Like "a staff member in good physical condition for the day." And this gives another lesser product, "a secure staff member for that day." And so it goes. This is not a list nor an exact wording of his products. But do you see that they all fit? They are ethics-type stats so they have *time* in them because they *preserve* and measure survival. They could not be graphed without *time* in them. They would not vary.

The Esto's MAA has "an Esto on post with ethics in that day." He has lesser products of "a defended or secure Esto that day" and "an Esto assisted with liaison with HCO." Do you see that the products mesh? If an Esto has out-ethics he can't be defended because he can be hit from above.

Also the Exec Esto's MAA has the staff and the Esto's MAA has the Estos so "both sides" are supported.

Now, if you product cleared the Exec Esto's MAA as having "a working Esto" as his product he would be at once the Exec Esto! While called "Esto's MAA." He wouldn't be able to make head nor tail of his post.

If the org's HCO Ethics Officer had the same products as the Esto MAAs (or, lord help us, all three had wrong products), whole zones of ethics would be missing in the org and out-ethics would occur. The Ethics Officer has several products but as HCO is a production division, he has "an out-ethics person whose ethic level has been made acceptable." It would not be "Ethics Orders issued" as that isn't the whole product of

the E/O nor would "people hit by Ethics" be a product because it isn't a product. The product would have to include *public* and if it didn't the whole public zone would be out. Students would get into an E/O section jammed with staff backlog and would be kept off course and maybe blow. Decent investigations couldn't be made. So ethics would go out in the area.

But an Esto having trouble with a staff member would know, if products were right and published, to send him to the Exec Esto's MAA!

And what of files? It's useless to duplicate files so HCO Ethics Files has *all* ethics files and the Exec Esto MAA's files and the Estos MAA files.

So, just with this example, you can see that products *can* be very neatly coordinated. AND MUST BE FROM STAFF MEMBER TO STAFF MEMBER in a section, a department, a division, an org. Then it all FLOWS. Somebody is in charge of each internal product in the org that it takes to make a VFP and in charge as well of that VFP loosely (incorrectly called) the GI (GI is really the valuable FINAL REWARD for which the VFPs are exchanged).

Thus, an org properly product cleared RUNS, PRODUCES VFPs in high volume and quality and is rewarded with GI and other things for which VFPs exchange.

And that's the org you want!

HCO POLICY LETTER OF 24 APRIL 1972
ISSUE I

REMIMEO

ESTABLISHMENT OFFICER SERIES 16

HATTING THE PRODUCT OFFICER OF THE DIVISION

Estos have been told "hat from the top down."

Why? Because the head of a div or org or the product officer of the org is the one who gets other people to work.

If the product officer is not hatted to get people to work there will be no products, the stats will be very low and that Esto could be very mystified and look bad as an Esto.

For if he does not do this one thing first then whatever else he does will be wasted.

An Esto who gets drawn in and given orders by a div head or who cannot confront the div head will wind up withdrawing from the div or just being inactive.

The first major failure of an Esto would be a failure to hat the product officer of the org or div.

FIRST SITUATION: There is no head of div (or org). Correct action: Get a head of div (or org) *fast* and *rapidly* org board the div. The number of people in the div (or org) does not matter at this stage. First things first. Get a head of div (or org). And rapidly org board the place.

SECOND SITUATION: You have a head of div (or org). Correct action: Hat him with HCO PL 28 July 71, ADMIN KNOW–HOW No. 26. Tell him you will attend to the hatting *IF* he will get them producing. *He* is responsible for their production. Get him to know this PL. (Method 4 W/C.) Tell him he is in Phase I. So let's see some production.

THIRD SITUATION: The head of div or org flies about, looks busy or just sits there. He is not getting out production. He will tell you all about "not being hatted," "doesn't know the tech," on and on, excuses, excuses. But no production from him or staff. Correct action: He has to be made to understand that he isn't doing his job no matter how *busy* he looks or how many reasons he has. He probably has not noticed and does not know that he is faking work. People with low confront don't *see*. If he *is* really doing his job and getting out his products and forcing any staff to get out theirs, you have a pearl. Cherish him, and don't consider doing this third action on him. But one is easily fooled. Only real products tell the tale. A busy exec or division is not necessarily a producing exec or div. So if no products from him or staff for whatever

reason, he's below Danger. You don't have a head of div or org if you don't have products coming off and exchange occurring. Only *these,* not excuses or motions, tell the tale. You can get "PR" and glowing (but false) reports. You can get all sorts of things. But where are the products? So you bait (tease) and badger (nag) the head of div (or org) to IMPINGE ON HIM (draw his attention) until he snarls or cries or screams AND SPITS OUT AN OUTPOINT. You don't ask him like repetitive commands "Why aren't you working?" You ask in many ways "Where are the products?" And he'll eventually tell you an outpoint. Like "But I can't get out any products because they aren't products until they are back home telling people how good we are so how can I _____." Or "I just keep running around here and nothing happens." Or some other nonsense that *is* nonsense. That's his Why. So you tell him, "Look, you don't get out products because you don't think you can!" Or "You are just trying to look busy so you won't be thought idle." And if you're smart and on the ball, that will be it. The exec will cognite and go into smooth two-way comm at once and you got him out of the Esto PL Series 13 state into a confront. This is "Bait and Badger" to get him broken out of nonconfronting. That's all that's wrong with him really. He doesn't look.

SITUATION FOUR: The exec won't let an Esto near him. Snaps, snarls. Don't avoid him. Correct action: Bait and Badger. He's already halfway through Situation Three above. Finish it up.

SITUATION FIVE: The exec goes into shock. This is a symptom of no confront. He won't fight back. He will propitiate. But he won't do anything either. Correct action: Get a new exec. Tame execs who won't fight and can't work will never get a staff to work. After getting a new exec, salvage the old one with processing. Do steps one to four on the new one.

SITUATION SIX: Having gotten the original or a new exec this far, you will find he is usually outpointy in his actions even if producing. Correct action: Run Confront in his area. Run Reach and Withdraw in his area. Then product clear him on every section and department he has as though he's the head of it.

SITUATION SEVEN: Gets out volume but quality suffers. This is a general nonconfront. Correct action: Bring him personally up through each dynamic, through the conditions per Esto Series No. 14. Get him in normal or higher on each dynamic. Now do Dynamic Exchange, Esto Series No. 14.

SITUATION EIGHT: He is active, producing but isn't forcing staff to produce. Correct action: Recheck him on HCO PL 28 July 71, ADMIN KNOW–HOW No. 26, and look for a Why that he can't pull himself out of Phase I into Phase II. Get this VGIed. Tell him, "Preach to them that dones come from effective doingness. If they don't do things that are effective they will not get a *done.* Demand DONES."

SITUATION NINE: He really doesn't know his job. Correct action: Begin to hat him. Don't start hatting him further than an instant hat before you have worked it up to Situation Eight. His *confront* will not be good enough to apply the material even if he knows it. So only at this stage do you start to really hat. And at this stage you hat by *observing* what he doesn't know that he needs to know and you look up and select PLs that fit his current state of unhattedness and check him out on only these. You keep a log of what he's checked out on so he gets credit for it.

SITUATION TEN: The executive skids back. He roller-coasters or gets ill. Correct action: Recognize this as a PTS situation. Get him interviewed by the D of P. Get the PTS situation HANDLED and don't buy "It's just the flu" or whatever. He's PTS and that's trouble. (See HCOB 17 Apr. 72, C/S Series 76, C/Sing A PTS RUNDOWN.)

SITUATION ELEVEN: The exec does not seem to remember what he's been checked out on or apply what he knows. He is glib or he is foggy. Correct action: Get him word cleared Method 1. Then word clear him Method 4 on the materials he has covered. (See Word Clearing Series HCOBs.)

HOW MUCH TIME

How much time do you spend with an exec?

Well, effective or not his time is valuable.

Do not use peak load post time or he'll be going mad with the PTP of unhandled actions needing to be done. So you won't get anywhere.

Try to do these actions on an exec during his *study time.*

Observe him on post to know what to do in his study time.

If he has no study time, you must get the Study Correction List (HCOB 14 Jan. 72, Study Series 7)* done on him and handled as in Situation Thirteen. An exec who can't study can't see either.

If this conflicts with your own study time, make other arrangements for that portion of yours. But get yours IN too.

SITUATION TWELVE: Has study time in addition to working hours but does not study. Correct action: See that study time is run per WHAT IS A COURSE? HCO PL 16 Mar. 71 I and WHAT IS A COURSE HIGH CRIME, HCO PL 16 Mar. 72 V and LRH ED 174 Int, STUDY AND TECH BREAKTHROUGH, 29 Mar. 72.

SITUATION THIRTEEN: Even though staff course exists does not study. Correct action: Have a Study Corr List, HCOB 14 Jan. 72, Study Series 7, done and properly handled.

REST OF STAFF

What do you do with the rest of staff?

These thirteen situations cover as well any staff member.

You could do no worse than do these things on each one as beginning actions.

There are many Esto actions that can be done but if you don't get these done you won't get far.

But on staff below dept head, Situations One, Two and Eight do not apply.

*[*Editor's Note:* HCOB 14 Jan. 72, Study Series 7, was later replaced by HCOB 4 May 81RA, Rev. 27 June 88, STUDY GREEN FORM.]

SITUATION ONE STAFF: Major post not posted. Correct action: Force a Dept 1 into existence via the Exec Esto and get it producing staff and get the post posted. (Don't do an incorrect action and use other parts of the org as personnel pools and dismantle working installations or rob Tech.) Get the org board up and the person on it.

SITUATION TWO STAFF: You have a person on the post. Correct action: Instant-hat him. Get him programed for training for post. Unbug his study time. See that he studies per program.

SITUATION EIGHT STAFF: He is active and producing but isn't moving his products or is backlogging and/or gets in jams. Correct action: Volume 0 of OEC Course, get in its comm sections, drill him on org board and show him the other terminals he is supposed to be in comm with. Make him follow his product physically through lines and then make him follow the routes of things that should come to him. While doing this you will find bugs in the lines or in his own lines. Smooth them out. Drill the person further.

THIS PL AS A CHECKLIST

You can use this PL as a checklist.

Get a cardboard folder. Put the person's name on it.

Write the person's name in at the top of this PL.

When each action is done, mark the dates it is being worked on in the margin beside the situation with your initial.

When fully done mark it DONE with date. Beware of NOT–DONES or HALF–DONES or BACKLOGS. (See AKH Series 29, Exec Series 5, both are HCO PL 26 Jan. 72 I, NOT–DONES, HALF–DONES AND BACKLOGS.)

Don't skip about on this one.

THE GENERAL WHY OF INACTIVITY OR NONPRODUCTION IS: LOW CONDITION ON ONE OR MORE DYNAMICS MAKING A NONALIGNMENT WITH OTHER DYNAMICS CAUSING AN INABILITY TO CONFRONT.

Most beings are not there as a being as they are below existence. As a being plus body they have social responses and can do orders or will do at something when attention is called to it. Otherwise they are blind with their eyes wide open. They are not malicious. They just don't SEE.

If they are not there they won't have to be responsible for what they do, will they? They do not think they have lived before or will live again, which is why the population is fixed on a one-life idea.

As a result the above situations *do* occur. And the handling has been tested and works.

Do not say, "Why haven't you seen _____" this or that outness. Say, "Do you see this _____" outness. And they will look in that direction. But sometimes have to be shown further evidence. Then they *see* it. Until the above situations are handled, you are working with social machinery.

When you have handled these situations as above correctly as noted, you will get toward full application of HCO PL 5 May 59, POLICY ON SEC EDs AND HATS, Vol 1 of OEC. Call the above "correct actions" the modern processes plus many other Esto actions and you *can* bring the exec to CAUSE so that he CREATES his post.

Until you have handled, using his social machinery as per the situation handlings above, he is *not* being bad, he just *can't see*.

This is how you get an exec functioning.

It is no overt act to get him functioning as only until you do will he have any morale at all.

SITUATION FOURTEEN: An exec or staff member may try to use the Esto as an org officer or to get the Esto to get involved in the division's products. BOTH are fatal Esto errors. Correct action: Explain Esto functions to them briefly so they know the Esto's product is THEM.

CHINESE SCHOOL

As very few westerners have ever seen a Chinese or Arab school in progress, it is very easy for them to miss the scene when one says "Chinese school."

The term has been used to designate an action where an instructor or officer, with a pointer, stands up before an assembled class and taps a chart or org board and says each part of it.

It is very funny to one who knows or has heard a real Chinese school to see the class sitting there silently. This is strictly a Western pattern. This is how a teacher does it in Omaha or Cornell. But never in Shanghai!

A Chinese class sings out in unison (all together) in response to the teacher. They *participate!*

The only Western near equivalent is a German beer hall where the audience choruses items sung out by the song leader.

Chinese school, then, is an action of class vocal participation. It is a very lively loud affair. It sounds like chanting.

In a real Chinese school the response is so timed that although spoken by many voices it is quite easy to tell what answer is being chorused.

It is essentially a system that establishes instant thought responses so that the student, given "2 x 2" thinks instantly "4."

For example, the instructor, tapping a big multiplication chart cries, "Two times two." The class in one voice cries, "Four." Instructor: "Five times two." Class: "Ten." And so on and on and on by the *hour*.

This gets more complex when, let us say, the maxims of good conduct or the Koran are being taught. In such cases the tablets or scrolls are on the wall. The teacher calls chapter and verse and the students chant it.

You could teach the Laws of Listing and Nulling, the Auditor's Code, Axioms and so on in this way.

The tools are the same — an instructor, a pointer, a chart or set of pictures or big scrolls, a class.

There are two steps in such teaching.

A. The instructor taps and says what it is. Then asks the class what it is and they chant the answer.

B. When the class has learned by being told and repeating, the instructor now taps with the pointer and asks and the class chants the correct answer.

DRILL

The instructor himself has to grasp the drill.

Here is how it would go on an org board.

A

Instructor taps Div 1. "This is Division 1 HCO Division."

Class chants, "Division 1 HCO Division."

Instructor taps Div 6. "This is Division 6 Distribution Division."

Class: "Division 6 Distribution Division."

And so on until all divisions have been named a few times.

B

Instructor taps Div 1. "What is this?"

Class: "Division 1 HCO Division."

Instructor taps Div 4. "What is this?"

Class: "Division 4 Tech Division."

And so on and on. The divisions are then considered trained-in on the class.

Next one would go to departments. Then to philosophic names of departments. Then to sections. Then one would go to the titles of each division head. Then to dept heads. Etc. Etc.

If one had a function org board of what each div and department and post *did* one would go on with the same thing.

A Chinese school drill run for a short period each day will eventually cover an enormous amount of org board.

Newcomers to the drill have to be schooled-in to catch up or join a new class.

Anything can be taught by Chinese school that is to be learned by rote. The parts and actions are always the same.

There is also a version that uses a text, preferably with a copy of it in each student's hands. It sounds the same.

One is limited only by what he can put on a chart or even in a text where each student has a copy of the text open before him.

Crude charts are easy to draw up with a felt (heavy ink) pen. The size of a chart is determined by the ability of the students furthest away to see it easily.

Cloud types, pictures to be named in a foreign language, even slides of airplane types, anything can be Chinese schooled that is to be learned verbatim. And you'd be surprised how many things should be. And if they aren't the person has a shaky foundation under the subject.

Care should be taken to define strange words. But it is not really a problem or exercise in Word Clearing. It is verbatim rote teaching.

And it works.

And is lots of fun.

CHINESE SCHOOLING AN ORG BOARD

Ref: HCO PL 13 May 72 I

Esto Series 17
Study Series 4
CHINESE SCHOOL

In a Chinese school the instructor stands up before the class, with a pointer, and taps each part of the chart or text being taught and says it. A Chinese class then chants in unison in response to the teacher.

This system of verbatim teaching is used in orgs to drill the org board.

There are two steps in Chinese schooling an org board.

A. The instructor taps the org board with a pointer and says what it is. Then asks the class what it is and they chant the answer.

B. When the class has learned by being told and repeating, the instructor now taps the org board with the pointer and asks, "What is this?" and the class chants the correct answer.

The top exec of the org (CO or Exec Dir) is the first one drilled, with other execs following suit, as they have to know the org board far better than the crew — otherwise they will run a "hey you" org board.

Chinese schooling an org board is never flattened. Once you get the org board itself and the names of the people on the posts well drilled, you start drilling the duties of each department and every post one by one, all the way down the org board and that takes weeks. Then you go back to whole org board drilling and so it goes.

REVISED 14 DECEMBER 2000

REMIMEO

DATA SERIES 26
ESTABLISHMENT OFFICER SERIES 18

LENGTH OF TIME TO EVALUATE

(Restored 14 Dec. 2000 to the original LRH text.)

It will be found that long times required to do an evaluation can be traced each time to AN INDIVIDUAL WHY FOR EACH EVALUATOR.

These, however, can be summarized into the following classes of Whys:

This list is assessed by a Scientology auditor on a meter. The handling directions given in each case are designations for auditing actions as done by a Scientology auditor and are given in the symbols he would use.

1. **MISUNDERSTOOD WORDS?** _____
   (Handled with Word Clearing [Method 1 and Method 4 of the Word Clearing Series].)

2. **INABILITY TO STUDY AND AN INABILITY TO LEARN THE MATERIALS?** _____
   (Handled by a Study Correction List HCOB 4 Feb. 72.*)

3. **OUTPOINTS IN OWN THINKING?** _____
   (Handled by what is called an HC [Hubbard Consultant] List, HCOB 28 Aug. 70.)

4. **PERSONAL OUT ETHICS?** _____
   (Use PL 3 May 72, by an auditor. Has two Listing and Nulling type lists.)

5. **DOING SOMETHING ELSE?** _____
   (2-way communication or PL 3 May 72 or reorganization.)

6. **IMPATIENT OR BORED WITH READING?** _____
   (Achieve superliteracy. LRH Executive Directive 178 International.)

7. **DOESN T KNOW HOW TO READ STATISTICS SO DOESN T KNOW WHERE TO BEGIN?** _____
   (Learn to read stats from Management by Stat PLs.)

*[*Editor's Note:* HCOB 4 Feb. 72 was later replaced by HCOB 4 May 81RA, Rev. 27.6.88, STUDY GREEN FORM.]

FIND
AGAIN
EXIT
CONTENTS
ORG BOARDS
INDEX

8. **DOESN T KNOW THE SCENE?** _____
(Achieve familiarity by direct observation.)

9. **READS ON AND ON AS DOESN T KNOW HOW TO HANDLE AND IS STALLING?** _____
(Get drilled on actual handling and become Super-Literate.)

10. **AFRAID TO TAKE RESPONSIBILITY FOR THE CONSEQUENCES IF WRONG?** _____
(HCOB 10 May 72 on Robotism. Apply it.)

11. **FALSELY REPORTING?** _____
(Pull all withholds and harmful acts on the subject.)

12. **ASSUMES THE WHY BEFORE STARTING?** _____
(Level IV Service Facsimile triple auditing.)

13. **FEEL STUPID ABOUT IT?** _____
(Get IQ raised by general processing.)

14. **HAS OTHER INTENTIONS?** _____
(Audit on L9S or Expanded Dianetics.)

15. **HAS OTHER REASONS NOT COVERED IN ABOVE?** _____
(Listing and Nulling to blowdown F/N item on the list.)

16. **HAS WITHHOLDS ABOUT IT?** _____
(Get them off.)

17. **HAS HAD WRONG REASONS FOUND?** _____
(C/S Series 78.)

18. **NOT INTERESTED IN SUCCESS?** _____
(PL 3 May 72, and follow as in 14 above.)

19. **SOME OTHER REASON?** _____
(Find it by 2-way comm.)

20. **NO TROUBLE IN THE FIRST PLACE?** _____
(Indicate it to person.)

When this list is assessed one can easily spot why the person is having trouble with the Data Series or applying it. When these reasons are handled, one can then get the series restudied and word cleared and restudied and it will be found that evaluations are much easier to do and much more rapidly done.

REMIMEO

ESTABLISHMENT OFFICER SERIES 19

PROGRAM DRILL

A majority of people cannot follow a written program. Yet all legal projects are in program form.

The reasons are various. But when programs are not understood they can be cross-ordered, abandoned, left half-done and the next thing you know you have a backlog (HCO PL 26 Jan. 72 I, NOT–DONES, HALF–DONES AND BACKLOGS).

There can be (and usually are) other situations that prevent the doing of a program. Out-ethics (PL 3 May 72, ETHICS AND EXECUTIVES), PTS or SP (PL 5 Apr. 72, PTS TYPE A HANDLING), lack of understanding of a product or exchange, an unmanned or undermanned area are the commonest reasons. But when all these have been handled, there can be two other reasons — the written project itself is bugged so it can't be done (needs special equipment or finance or is outpointy or doesn't apply) or THE PERSONS CONCERNED JUST CAN'T DO A PROJECT. The former of these reasons is seized upon all too often to excuse the latter WHICH USUALLY IS THE CASE. They can't execute a project and prefer cross orders because the orderliness of a project or what it is, is not understood. Therefore, to handle this we have the following project drills.

The person is just to do these, honestly, each one, from targets 1 on.

DUMMY PROJECT 1

PURPOSE: To learn to do a project.

MAJOR TARGET: To get it done.

PRIMARY TARGETS:

1. Read this PL down to "Dummy Project 1."
2. Check off each one when done.

VITAL TARGETS:

1. Be honest about doing this.
2. Do all of it.

OPERATING TARGETS:

1. Take off your right shoe. Look at the sole. Note what's on it. Put it back on.
2. Go get a drink of water.
3. Take a sheet of paper. Draw three concentric circles on it. Turn it over face down. Write your name on the back. Tear it up and put the scraps in a book.
4. Take off your left shoe. Look at the sole. Note what is on it. Put it back on.
5. Go find someone and say hello. Return and write a despatch to your post from yourself as to how they received it.
6. Write a despatch from your post to yourself in proper despatch form Volume 0 OEC correcting how you wrote the despatch in 5 above. File it in your hat.
7. Take off both shoes and bang the heels together three times and put them back on.
8. Write a list of projects in your life you have left incomplete or not done.
9. Write why this was.
10. Check this project carefully to make sure you have honestly done it all.
11. List your cognitions if any while doing this project.
12. Decide whether you have honestly done this project.
13. Hand all written papers including the scraps in the book over to your Esto or senior with a proper despatch on top Dummy Project No. 1 Completion.

END OF PROJECT

DUMMY PROJECT 2

PURPOSE: To learn about production.

MAJOR TARGET: To actually produce something.

PRIMARY TARGETS:

1. Get a pencil and five sheets of paper.
2. Situate yourself so you can do this project.

VITAL TARGETS:

1. Read an operating target and be sure to do it all before going on.
2. Actually produce what's called for.

OPERATING TARGETS:

1. Look very busy without actually doing anything.

2. Do it again but this time be very convincing.
3. Work out the valuable final product of your post. Get help from your Esto or senior as needed.
4. Straighten up the papers in your in-basket.
5. Take sheet 1 as per primary targets above. Write whether or not No. 4 was production.
6. Pick over your in-basket and find a paper or despatch that doesn't contribute in any way to your getting out your own product.
7. Answer it.
8. Take the second sheet called for in the primary target. Write on it why the action in 7 is perfectly reasonable.
9. Take the third sheet of paper and draw the correct comm lines of your post.
10. Get out one correct product for your post, complete of high quality.
11. Deliver it.
12. Review the operating targets and see which one made you feel best.
13. Take the fourth sheet of paper and write down whether or not production is the basis of morale.
14. Take the fifth sheet of paper, use it for a cover sheet and write a summary of the project.
15. Realize you have completed a project.
16. Deliver the whole project with papers to your Esto or senior.

END OF PROJECT

REMIMEO

ESTABLISHMENT OFFICER SERIES 20

SUPERVISOR TECH

Refs:

HCO PL	25 June 72	RECOVERING STUDENTS AND PCs
LRH ED 174 Int	29 Mar. 72	STUDY AND TECH BREAKTHROUGH
LRH ED 178 Int	30 May 72	SUPER–LITERACY

It should be very plain to an Esto that if the materials of Dianetics and Scientology are not available and not taught, all his work will be in vain.

The TRAINING and HATTING of Course Supervisors is not a product officer function. It belongs to HCO Dept 1 or the E Esto or his TEO.

A failure on course supervision (and Cramming Officer functions) will throw out the whole tech delivery of an org *and* staff and defeat everything an Esto is trying to do.

Public and staff courses are both of vital importance. After these come auditing. But where training fails, auditing won't occur as the auditors won't be able to audit.

Further, an Esto often trains and he should have these points down as well. And he should get them in on Supers NO MATTER WHAT DIVISION HE IS ESTOing.

If he doesn't, a training breakdown will defeat all his best laid plans. Bad Supers? So who gets trained?

MATERIALS

First and foremost is *materials*. If you don't have these on the course for that course, what course?

Always check the available materials and then move mountains to get them remedied where out or missing or too few.

SCHEDULES

Next is schedules.

These must be real and KEPT BY THE SUPER AS WELL.

PRESENCE

Next is the existence or presence of the Super.

There may be none, he may be there part time, he may be there but doing something else.

Get the Super on the course supervising the course, not doing admin or folders. (With a course co-auditing, the D of T whose job it is, dumps it on the Super or fails to get a C/S and then there's no Super.)

So get a Super supervising the course properly as his hat and duty.

SUPER ASSISTANCE

Two extremes can happen in course supervision:

1. *No* attention to the student.

2. Bothering the student and stopping his progress.

The point one has to grasp is "OBNOSIS." This is a coined (invented) word meaning OBSERVING THE OBVIOUS. There is no English or any other language precise equivalent for it.

Man just does not seem to observe the obvious. The reason for it is misunderstood words. Not understanding the symbol (word) the actual thing can become somewhat less visible.

The real job of the Course Supervisor is to get the puzzled or doping or bogged student going. And to *protect* the student who is flying from interference, including the Super's own.

To do this the Course Supervisor has to *observe the obvious.*

Is the student going okay?

Is the student bogged?

What *is* an F/Ning student? Is he chortling and gurgling and slapping his knee? No. He is just calmly going right along.

What *is* a bogged student? Is he stretched out on the floor snoring? No, he is groggy or puzzled or frowning or even emotionally upset by his Mis-U words. When not caught and handled he will go to sleep or just stare into space.

Should a student's fingers be wiggling? No, he should do demos fully and with full attention only when he has something to demo in order to grasp it. Should two students be chattering about a date they had? No. They are not F/Ning *students* even if they are F/Ning gossipers.

When the Super does not know the key words of his post, his power of observation is low. To remedy this one does Word Clearing Method 6 on him (HCOB 21 June 72 II, Word Clearing Series 39, METHOD 6).

NAVIGATE
FIRST PAGE
SEARCH
FIND
AGAIN
EXIT
CONTENTS
ORG BOARDS
INDEX

And one gets him to look.

To keep from looking a Super can develop systems like, "Every 36 minutes I'll check up on every class member for it takes just 36 minutes to go around them all."

When an F/Ning student is interrupted by the Super he can be given a "withhold of nothingness." The student may say, "No, I've just been checked up" and the Super goes away. But the student now wonders, "Am I trying to hide something?" "Am I really doing all right?" Etc. A W/H of nothingness.

To keep students from blowing, BOTH these points have to be looked into.

OBNOSIS is the drill required on the Super.

And a Method 6 on the key words of his post.

And Product Clearing and his own study Why.

Study tech does work but must be applied!

A Supervisor must be a Super-Literate to be of real use.

Apply LRH ED 174 Int of 29 Mar. 72 and LRH ED 178 Int of 30 May 72.

BLOWN STUDENTS

See HCO PL of 25 June 72 RECOVERING STUDENTS AND PCs for check items of how to get students back on course.

SUMMARY

An Esto backed up by good courses and course supervision will eventually bring it all straight.

FOUNDER

HUBBARD COMMUNICATIONS OFFICE
SAINT HILL MANOR, EAST GRINSTEAD, SUSSEX

HCO POLICY LETTER OF 28 JUNE 1972

REMIMEO

ESTABLISHMENT OFFICER SERIES 21

FILES ACCURACY

As files are the vital operational line it is of the GREATEST IMPORTANCE that *ALL FILING IS ACCURATE*.

A misfiled particle can be lost forever.

A missing item can throw out a whole evaluation or a sale.

Items get misfiled for four reasons:

1. Ignorance of the alphabet

2. Ignorance of geography

3. Ignorance of the vital role of the files

4. Personal out-ethics

The remedies therefore are:

1. ALL FILES PERSONNEL (a) MUST BE ABLE TO RATTLE OFF THE ALPHABET FORWARDS AND *BACKWARDS*. (b) They must be drilled then to be able to give the letter ahead of and behind each letter in the alphabet.

2. GEOGRAPHY must be known to files personnel, particularly the locations of orgs, cities, states and continents. This is done by drilling them on a map that has key locations related to files.

3. Method 6 W/Cing should be done on words connected with the post and action of filing. Then the value and purpose of the files they handle should be done by them.

4. Persons with out-ethics or on an ethics cycle should not be given filing as an amends as they are not drilled and are out of PT to say the least.

ETHICS ACTION

Anyone finding a misfiled particle should report it to the Ethics Officer or Master-at-Arms.

He must then quickly make every effort to locate who is misfiling and take rapid action.

The first action is to hat them as above.

Any repeat is an ethics offense handled by a Court.

If the E/O cannot find the person or does not act he himself must comb all files and straighten up the particles.

SUMMARY

It is of vital interest both in ease of work and financially that all files are straight.

EXECUTIVE SERIES 14
ORG SERIES 30
ESTABLISHMENT OFFICER SERIES 22

ESTO FAILURES

For several months I have been studying the Esto system in operation and have finally isolated the exact points of any failures so they can be turned to successes.

PUTTING IN THE SYSTEM

An Esto returning to an org can crash it.

The exact reasons for this are:

A. The execs who heretofore did organizational work say, "Ah, here's the Esto system at last," and promptly drop their organizational and personnel actions.

Yet here is this lone E Esto, no divisional Estos, no one trained to support him.

The right answer is when an E Esto goes into an org where there are no Estos or only a TEO or QEO, he must gather up the execs and tell them it will take him weeks to recruit and train Estos and that THEY MUST CONTINUE ANY ORGANIZATIONAL ACTIONS THEY ARE DOING and that the HAS IS STILL ESTABLISHING THE ORG.

Otherwise they let go their lines.

B. The new E Esto takes key production personnel from the divisions to be Estos and they crash.

The answer to this is to RECRUIT the new Estos.

This is easier than it looks if you recruit idle area *auditors* to be Estos.

If you do this, remember that they went idle as auditors because they had out-ethics, were PTS, had misunderstoods and out-TR 0. To get them you do a 3 May 72 (ETHICS AND EXECUTIVES) PL, a 5 Apr. 72 (PTS TYPE A HANDLING) PL, Method 4 on their courses and make them do *real* TRs, especially zero. And they'll be ready.

You get a list of area auditors and contact them and do the above on them and you'll have Estos who are half-trained already.

Failing this or in addition to it just plain recruit.

C. The first post a new E Esto should take is Dept 1.

He does NOT "hat the HAS" or "just do programs." He rolls up his sleeves and WORKS as director of Dept 1.

He recruits, he posts up Dept 1. He hats the hell out of Dept 1.

He makes a Department 1 that really, really flows in personnel, puts up org boards and hats.

WHEN he has a Department 1 FUNCTIONING he can begin to recruit Estos as well as other org staff.

If he can't get a Dept 1 whizzing he has no business being an Esto, does he?

He does NOT put in Dept 2 or act as Dept 3. He makes the HAS handle these.

With a *strong working* Dept 1, an Esto system can then go in.

D. Musical chairs is the commonest reason any org collapses.

A "new broom sweeps clean" complex will wreck any org.

An E Esto on arrival, taking over Dept 1, FREEZES ALL PERSONNEL TRANSFERS. He does not permit even one transfer.

The only exception would be where a musical chair insanity has just occurred. If this was followed by a stat crash then one REVERTS THE ORG TO THE UPSTAT PERIOD and *then* FREEZES PERSONNEL TRANSFERS.

But before one reverts one must evaluate the earlier period by stats to be sure it WAS the upstat period.

By freezing personnel one protects what he is building.

Almost all musical chairing is the work of a suppressive except when it is the work of an idiot.

E. Anyone trying to hold Dept 1 in a personnel starved org is holding a hot seat as any HAS or Personnel Director can tell you.

Body traffic to this dept in any medium-sized org defies belief.

It looks like Grand Central Station at the rush hour.

"I have to have _____," "Where is my Course Super _____?" etc., etc., etc., is the constant chant.

You can spend the whole day interviewing staff execs and get nothing done.

There is a right way to do all these things and a billion wrong ways.

Obviously the answer to all their problems is to get and train new people. Yet how can one in all the commotion.

Ninety percent of these requests are from people who are not hatting and using the people they already have.

The right way is on any new personnel demanded one gets Dept 3 to do an Inspection and Report Form for people in the area of the exec doing the demanding. You will find very often unhatted, untrained and wasted personnel and many outnesses.

You hold the line on personnel by saying: "Handle these unutilized or half-working staff or these outnesses. You are here on my procurement board as entitled to the (give priority, 3rd, 8th) person we hire or recruit."

And get industrious in recruiting, using all standard actions, for that is the only way things can be solved.

Most orgs would run better on less people because the personnel are not hatted or trained. One org, two years before this writing, made *four* times as much money on *half* the personnel it now has.

Unhatted, the staff is slow and uncertain. Unproducing, the div heads demand little.

But they sure can scream for more personnel!

No org ever believes it is overmanned.

F. Some divisions (like the usual Treasury or Dissem) can be undermanned. Key income posts most often are empty.

When one mans up an org one sets priorities of who gets personnel.

This is done by PRODUCTION paralleling. One mans up against production.

New people come in through Div 6. They are signed up by Div 2. Delivery is done by Div 4. Money is collected by Div 3. That gives you a sequence of manning up.

You man income and delivery posts with new hirings.

The E Esto is trying to get in a Dept 1 so of course he gives this a priority as well.

Until the income is really rolling in and the delivery rolling out, one does very little about other areas.

Having gained VOLUME, one now begins to man up for quality. This means a Cramming and a W/C Section in Qual. It means more HCO.

One now hits for future quantity by getting auditors in training, more upper execs in training.

When the org is so built and running and viable it is time the whole Esto system got manned up.

G. Every 5th person hired on an average should be put in Dept 1 as a *Dept 1* extra personnel who does Dept 1 duties and trains part time as an Esto.

This gives the E Esto additional personnel in Dept 1.

It also begins an Esto right.

His most essential duties as an Esto *are* Dept 1 type duties.

You eventually have a bulging Dept 1. You have a basic Dept 1 that functions well and will continue so. You have the Esto trainees who are working in Dept 1 as Dept 1 personnel. And you have of course some new people who are HCO Expeditors until they get in enough basics for real regular posting.

This makes a fat Dept 1 and proves one can Esto!

SUCCESS

If an E Esto introduces the Esto system exactly as above and in no other way, he will be a success.

Like an auditor varying processes or altering HCOBs, a new E Esto who varies the above will bring about disaster.

Where E Estos have gone into orgs other ways or where the system has been varied, stats have crashed.

By going in this way, as above, it can be a wild success.

How fast can you put in an Esto system? It takes months of hard work. It depends really on how good the E Esto is at recruiting, org boarding and hatting.

If he's good at these things the time does not stretch out to forever.

For comparison, it took half a year each to build DC, Johannesburg and SH to their highest peaks. They were all built from a Dept 1 viewpoint of recruiting, org boarding and hatting hard enough to get production.

So this is the oldest pattern we have — Dept 1 evolves the org.

When the org gets too big Dept 1 loses touch. You extend it into each div and you have the Esto system. And you have Estos.

REMIMEO

EXECUTIVE SERIES 15
PERSONNEL SERIES 26
ORG SERIES 31
ESTABLISHMENT OFFICER SERIES 23

THE VITAL NECESSITY OF HATTING

On a graph analysis of past stats, my campaign on hatting where a hat was a checksheet and pack apparently introduced a steady rise of the International Gross Income.

Studying this further I discovered a new basic, simple fact:

HATTING = CONTROL

A person who is hatted can control his post.

If he can control his post he can hold his position in space — in short, his location. And this is power.

When a person is uncertain, he cannot control his post, he cannot control his position. He feels weak. He goes slow.

If he can control his post and its actions he feels confident. He can work effectively and rapidly.

The key is CONTROL.

Control is the ability to START, CHANGE and STOP.

When he is hatted he knows the tech of HANDLING things. Thus he can control them. He is at CAUSE over his area.

If you have an org composed only of weak wobbly posts, they tend to collapse in on each other. There is no POWER.

The org then cannot be CAUSE over its environment because it is composed of parts which are not cause. The whole is only the sum of its parts.

If all the parts are each one at cause, then the whole will be at CAUSE over its environment.

Only an org at CAUSE can reach and CONTROL.

Thus a fully hatted org can be at cause over its environment, can reach and control its fates and fortunes.

THUS THE PRIMARY TARGETS OF AN ESTO ARE:

A. ESTABLISHED ORG FORM and

B. FULLY HATTED PERSONNEL.

BASIC SEQUENCE OF HATTING

1. Recruited or hired. Signs contract.
2. Instant-hatted for the job assigned as an HCO Expeditor.
3. Staff Status 0.
4. Basic Study Manual (if the staff member has not previously done the Student Hat or Primary Rundown).
5. Staff Status I.
6. Staff Status II.
7. Posting as other than an HCO Expeditor.
8. Full hatting with a checksheet and pack fully done with M6, M7, M9, M3 and M4 Word Clearing.
9. Eligibility for study and auditing (OR for staff service or study).
10. Must have a stat and demonstrated he has produced on post.
11. Purification Rundown.
12. Objective Processes: CCHs, 8-C, SCS, Havingness, etc.
13. Scientology Drug Rundown (if required).
14. Method One Word Clearing, Student Hat.
15. Administrative or tech training (OEC or auditing).

Flag Orders in the Sea Org may change this lineup slightly but it is basically the same.

No one should have any other training, much less full-time training, before step 12 in the above.

After a staff member has completed Staff Status 0 he may receive PTS handlings and study the PTS checksheet and may have emergency assists. He may also be audited by students and TTC if he has rising stats.

There are time limits placed on how long it takes to do SS I and SS II. A person who can't make it is routed to Qual where he is offloaded with advice on how to get more employable. (In the SO it is Fitness Board.)

TIME–TESTED

The above is the route that has been tested by time and found good.

Other approaches have NOT worked.

Granting full-time training at once is folly. The person may get trained but he'll never be a staff member. This is the biggest failure with auditors — they don't know the org. Admin training with no org experience to relate it to is a waste of time.

This was how we built every great org. And when it dropped out the org became far less powerful.

Old-timers talk of these great orgs in their great days. And they will tell you all about the org boarding and hatting that went on. How the Hatting Officer in HCO and the Staff Training Officer in Qual worked as a team. And how fast the lines flew.

The above steps have stood the test of time and are proven by stats.

RECRUITING AND HIRING

You *never* recruit with a promise of free courses or free auditing. Not even HASes or HQSes. You recruit or hire somebody to be part of the team.

OPEN GATE

If *any* opinion or selection is permitted as to who is going to be let on staff, *all* recruitment and hiring will fail.

By actual stats when you let *anyone* say, "No! Not him! Not her!" the gate shuts, the flow stops. And you've had it.

Requirements and eligibility *fail*. The proof is that when they have existed in orgs, the org wound up with only PTSes and no-case-gains!

The right answer is FAST FLOW hiring. Then you have so many that those who can't make it drift low on the org board or off. You aren't trying to hold posts with unqualified people "who can't be spared."

In a short-staffed org "looking only for the best people" the guy nobody will have gets put in an empty "unimportant" department. He's now a Director!

It only happened because you didn't have dozens.

The answer is NOT lock the gate or have requirements. The answer is HAT.

An org that isn't hatted goes weak and criminal.

Don't be selective in hiring or recruiting. Open the gates and *HAT!*

Follow the steps given above and you have it.

Don't spend coins like training or auditing (or travel) on people until they have proven their worth. No bonuses or high pay for anyone until they have reached and attained step 10 (a good stat). The cost of such fast flow hiring is not then a big factor.

The only trouble I ever had with this was getting div heads to UTILIZE their staff. A FIRST JOB FOR AN EXECUTIVE IS TO GET THINGS FOR HIS PEOPLE TO DO. AND KEEP THEM BUSY AT PRODUCTIVE THINGS.

So I used to have to go through the org that did FAST FLOW HIRING regularly and get people to use their new people. And to move off those who could not work.

This was ALL the trouble I had with the system.

And until I enforced FAST FLOW HIRING there was always some effort by someone to close the gate.

ALL the great executives in Scientology came up in such orgs.

With a *flow* of people the best move on up. The worst, if any, drop off.

Only orgs with restricted hiring or recruiting give trouble.

IN A FAST FLOW HIRING ORG THE HAS AND ESTOs *MUST* BE ON THE BALL. THE BREAKDOWN OCCURS WHEN THEY DO NOT *HAT* AND KEEP ON TOP OF THE PERSONNEL SCENE.

Fast flow hiring only breaks down and gets protested where HCO and Estos are not doing a top job. They have to really *handle* the personnel, post them, hat them, keep the form of the org.

A fully formed org in a heavily populated location would need hundreds of staff. It would make hundreds of thousands.

But only if it is fast flow hiring, hatting, holding the form of the org, and only then could it produce.

REMIMEO

ESTABLISHMENT OFFICER SERIES 24

THE FORM OF THE ORG

You often hear that one should "hold the form of the org."

What is it?

Some people think it is making sure the command channel (junior to senior to senior's senior or on down). This is only a small part of an org form.

In any new group of a few people, each and every one wears all the hats. This is *not* an org form.

An org form is *that arrangement of specialized terminals which control and change the production and organization particles and flow lines of an activity*.

A *terminal* for this purpose is something that has mass and meaning which originates, receives, relays and changes particles on a flow line.

SPACE

To have any form at all, an org must have *space.*

The space must be located where it can have particles and flows or where the particles and flows with which it deals can easily be gotten to it and sent out from it and where it can conduct its activity without undue disturbance and at a velocity and volume with exchange that makes it viable.

There are a number of factors involved as noted in the above requirement: located, can have particles and flows, can get them in and out, no undue disturbance, velocity and volume, exchange and viability.

Although this looks complex, it is actually very simple as it involves *just those elements* and others are relatively unimportant. When you add aesthetics of building and grounds, and carpets and desks you can get too far off the definition of space requirement when these are given first priority. These are something you build up to. Clean and neat are closer to importance *after* the basic definition is met.

So one has a space. It has to be big enough for the traffic volume it has to handle to be viable. This is usually smaller than people think. The space is a building or other structure.

So we have a *space* as an essential of org form.

TRAFFIC GUIDE

Traffic, particles, flows have to be *guided.* They have to be pulled in (as per Div 6, Div 2 Reg, Div 2 Letter Reg, ASR, D of Tech Services, etc.). These are *reaches* out into the potential traffic that pulls it up to the space entrance point. In essence these posts work on the potential traffic and get it up to the door. So org form can start way out with a *general* approach, a magazine book ad, word of mouth, PR, an FSM, a ticket distributor, a book, etc. A specialized approach to specific names as per the Tour, the Letter Reg working CF, the Phone Reg, etc. One generally directs the whole "general public" toward the space and also specifically directs specific people in it toward the space.

This is the org form at work that functions outside the org space. If it doesn't function the org space itself gets no inflow.

Departing traffic must also be guided — and is too often neglected. An org without its CF up-to-date and used is neglecting its departing traffic.

England, for instance, loses a huge percent of its car sales business because it has no decent spare parts stockpiles (government taxes spare parts on the shelf). The customer who purchases often gets no follow-through.

Orgs that neglect departed traffic wind up with ARC broken fields.

So org form *must* include its own space *and* the spaces of its potential traffic and its departed traffic as they relate to the org's activity.

ROUTING

When particles arrive at the org space proper they must be routed AND MUST CONTINUE TO BE ROUTED FROM THE MOMENT THEY ENTER UNTIL THEY LEAVE THE ORG SPACE.

Thus there must be a Reception for bodies, for mail, for phone, for telexes and for messages in general.

There must also be an exit point for all these things and someone to send them on their way *out* of the org space.

Lack of a Reception that can and does route can break an org of any type or kind and has done so.

When bodies can't contact the org they assume the org is dead. And so it dies. The org can be so mislocated for its type of traffic that it can't get anyone in or out. Then, too, the org will seem dead.

No matter the INTERNAL form of the org, its external form can be so remote that success is impossible to maintain. Thus org form does not begin with reception and routing. This is an action that occurs after the external requirements are met.

But once the particle (body, despatch, raw materials, whatever) is at the door RECEPTION must establish the routing.

This is done usually with an each-step-signed-off ROUTING FORM that gives the full road map of the particle.

Without this, particles don't enter, jam up, get lost, go astray and DESTROY THE INTERNAL ORG FORM by making confusions.

Thus Reception has to have a very good idea of particle *types* and *org form* even to be able to issue the right routing form.

INTERNAL LINES

Routing forms often carry a particle into the org but not out.

This becomes a serious problem in getting anything *completed*. The start is on the form and not the exit. Thus the particle doesn't exit but piles up someplace.

When you see a mass of paper (in-baskets, pending, etc.) or a jam of bodies (Reg waiting room, DTS, etc.) or piles of unused pamphlets or unsold books you know two things at once:

A. Routing is unknown or not done or incomplete but in any event is faulty.

B. The internal org form is bad.

TERMINALS

To say internal lines are out, one must also be saying internal terminals are faulty.

Ideally, the internal org form is designed for flows with the target of production.

The internal space has to be so allotted and arranged that the lines flow.

The lines flow to terminals in the sequence of change required in each particle.

The principal particle, meaning the most important one for that org has the total priority for design of space and terminals.

If wheat were being processed, then the whole space and terminal allocation of the plant or org, to have *org form* would have to deal with *wheat*.

In a Scientology org it is public bodies. Thus the whole design of space and flows must deal with public bodies.

This is easily violated and when it is it makes a terrible confusion.

You have to trace such a flow with what is called a DUMMY RUN. This means going through the place pretending to be the principal particle.

When you first try this in most plants or orgs you really begin to wonder how *anything* happens ever.

The answer is correction of location, either of the whole space or the terminals in the space.

One can dummy run as anything. First dummy run the principal particle and lay that out by what has to be done to adjust the space and terminals to it. Then as a telex, then a despatch, then as a piece of money, then as an invoice, etc.

When you've done all these you'll really know what you're doing in terms of space and terminals. Until then it's all guesswork.

You will find you can't get in, you can't get handled, you can't stay in and you can't get out!

So you adjust space and terminals for the main particle and then for the lesser particles.

You will achieve a near optimum compromise.

Then you arrange it and drill it in on the terminals.

After that things will speed up and stats will go up.

HOLDING THE FORM

You now and only now have the FORM OF THE ORG.

It must be drawn up as org boards and flow plans and terminal location plans (three quite separate things). These three plans give you the form of the org.

Then you have to drill in EACH OF THE THREE PLANS usually with Chinese school.

You do the routing forms.

Now by HATTING you give each terminal control over his portion of the line.

The terminals will thereafter interact to bring about the needful flows.

And if your product is good and desired, the place will boom.

And that's what's really meant by the FORM OF THE ORG.

HCO POLICY LETTER OF 27 JULY 1972

REMIMEO

ESTABLISHMENT OFFICER SERIES 25

FORM OF THE ORG AND SCHEDULES

Those parts of the org engaged upon similar functions must be on the same schedule.

In essence, you can't play a ballgame with different members of the team appearing at different times. It would look pretty silly to have a goalkeeper show up in the last third of the game. By that time it would be lost.

If over a 24-hour period people on public lines showed up, each one, at different hours, there would be no public line. Thus there would be no org form. For there could be no flow of the major particle.

If an activity is open for business at 0900, let us say, the persons on key posts would have to be there at 0830 or at least 0845 in order to "open for business" (which means open for flow) at 0900.

Precision of schedule is determined by the *type* of particle the org form is set up to handle.

A service org handles bodies. A management org handles messages as the principal flow particle. A refinery would handle crude oil. A flour mill wheat, etc.

Of all particle types bodies tend to be the most random and are most likely to erode or knock out org form.

Thus a service org handling bodies has to be established and hatted about a dozen times more than one which handles inert particles.

This is one of the reasons "standard business practices" do not work in setting up an org. They are not strong enough or fast enough.

Schedules become very important in orgs which handle bodies. The lines rapidly jam up and make considerable confusion wherever the line goes faulty.

As almost every part of an org requires internal cooperation from almost every other part of an org, lack of schedules, unreal schedules or failure to keep a schedule are, after hatting and line establishing, the most likely causes of confusion or nondelivery.

It is important to start as a team and it is also important to stop as one if there is a "next shift" as in a Foundation. As the staffs collide, the students collide and the space tangles.

Operating a number of schedules at the same time for different parts of the org can get complicated. Governments do this to ease off automobile and commuter traffic but then they (governments) do not produce much and it doesn't matter. Half a dozen daily schedules running at the same time for one org can cause a considerable confusion.

The best schedules are very simple ones. You can have a schedule that has so many times in it, so many musters, that it is a full day's work just to keep the schedule!

A grave fault in schedules is not allowing any slack between two time points. Example: Class ends 1600. Next class, three blocks away, begins at 1600! Either one class has to let out early or everyone is late to the next class!

Schedules commonly omit any time spaces to take care of things. Example: 0900 on post. 0900 public lines open. Well, it's going to take 15 minutes or more to get a post set up, so the schedule gets violated. Thus we have it saying 0900 when it can only be 0915! This makes schedules look unreal to people, so they drop out. A correct version would be 0840 on post. 0850 open for business checklist collected. 0900 public lines open.

CLOSING LINES

Closing of lines costs a great deal. An extreme example is closing an org for 2 weeks "so everyone can have a vacation." African orgs used to do this and would often lose their higher stats for months.

Closing orgs "during a congress" can cost. During one national congress, several missions closed for a week and had to fight crashed stats for months.

Closing an org at noon or for supper can ball up lines and can have a heavy effect on stats.

All this "closing" is simply saying "we're dead."

Lines have a tendency to keep flowing when flowing and remain stopped when they are stopped.

If an org began at 0900 and, with a Foundation or second and weekend shifts, ran continuously until 2300 seven days their general stats would improve out of proportion to the additional time open.

Management orgs run very raggedly on schedules as their traffic loads vary so greatly.

It takes good observation and skill to write a good schedule for an org. If an unreal schedule exists or if one is too complex, it will not be kept. Peak loads have to be taken into account and their approximate times have to be established. There are also no-load times and to cover these with a full org is to fail to have an adequate org there for the peak loads.

Careful, real study, on the ground, watching traffic flows, has to be done to make a real schedule that will be kept and which boosts production.

A schedule which does not boost production or a schedule just to have one, are a waste of everyone's time.

So select the principal particle the org handles. Use it to determine the times of peaks and no-loads, study what goes on in actual fact. And then write the schedule. And see that it is kept.

This will greatly improve org form.

L. RON HUBBARD
FOUNDER

HUBBARD COMMUNICATIONS OFFICE
SAINT HILL MANOR, EAST GRINSTEAD, SUSSEX

HCO POLICY LETTER OF 28 JULY 1972

REMIMEO

EXECUTIVE SERIES 16
ORG SERIES 32
ESTABLISHMENT OFFICER SERIES 26

ESTABLISHING
HOLDING THE FORM OF THE ORG

If a person who could not play a piano sat down at a piano and hit random keys, he would not get any harmony. He would get noise.

If the head of a division gave orders to his staff without any regard to their assigned posts or duties, the result would be confusion and noise.

That's why we say a division head "doesn't know how to play the piano" when he knows so little about org form that he continually violates it by giving his various staff members duties that do not match their hats or posts.

But even if one could play the piano, one would have to have a piano to play.

SPECIALISTS

Each org staff member is a specialist in one or more similar functions. These are his specialties.

If he is fully trained to do these he is said to be HATTED.

The combined specialties properly placed and being done add up to the full production of an org.

The org form is then the lines and actions and spaces and flows worked out and controlled by specialists in each individual function.

These specialists are grouped in departments which have certain actions in common.

The departments having similar functions are grouped into divisions.

The divisions combine into the whole org form.

It is *far* less complex than it looks. It would be very complicated and confusing if there weren't divisions and departments and specialized actions. Without these you would get noise and very limited production and income, and at great strain.

Take a theater as an example. There are people who advertise it; these are the public relations people; they are hatted to get publicity and make people want to come to the play; call them the PR Division. There are the producers and directors; they are hatted to present a performance and make it occur; call them the Production Division. There are the actors and musicians; call them the Artists Division. There are the property men; they are hatted to get costumes and items needed; call them the Property Division. There are the stagehands and electricians and curtain and set men; call them the Stage Division. There are the ticket sellers and money handlers and payroll and bills payers; they are hatted on money and selling; call them the Finance Division. There are the people who clean the theater and show people to seats and handle the crowds; call them the House Division. And there are the managers and playwrights and score writers and angels (financiers); call them loosely the Executive Division.

Now as long as they know their org board, have their flows plotted out, are hatted for their jobs and do a good job, even a half-good play can be viable.

But throw away the org board, skip the flows, don't hat them and even a brilliant script and marvelous music will play to an empty house and go broke.

Why? Because an org form is not held. Possibly an untrained unhatted producer will try to make the stagehands sell tickets, the actors write the music, the financiers show people to their seats. If he didn't know who the people were or what their hats were he might do just that.

And there would be noise and confusion even where there was no protest. People would get in one another's road. And the general presentation would look so ragged to the public they'd stay away in droves.

ESTO ACTION

Now what would an Esto (or an Executive Director) have to do with, let us say, an amateur, dilettante theatrical company that was about to bog.

Probably half the people had quit already. And even if there were people in the company they would probably need more.

The very first action would be to Esto Series 16 the top men to make money quick.

The first organizing action would be to kick open the hiring door. This would begin with getting out hiring PR and putting someone there to sign people up who came to be hired (not to test and audition and look at references, but just to sign people up).

The next action would be to do a flow plan of public bodies and money. So one sees where the org form reaches. Then a schedule.

Next action would be to do an org board. Not a 3-week job. (It takes me a couple hours to sketch one with a sign pen for posting.) AND GET IT POSTED.

One then takes the *head* of each of these divisions and *hats* him on what his division is supposed to do and tell him to *do* it. NOW.

You make and post the flow plan, org bd and terminal locations plan where the whole company can see them.

Chinese drill on a flow plan to show them what they're doing and what has to be done.

Chinese drill on the org board including introducing each person named on it and getting it drilled, what he does and who he is.

You Chinese drill the terminal locations where each of these persons (and functions) is to be found.

You get agreement on schedules.

You now have a group that knows who specializes in what and what's expected of each.

You get the head of the whole company to work with and hat the heads of his divisions.

Now you get the heads of divisions to hat their own staffs while you help.

And you get them busy.

You then put the polishing touches on your own Dept 1 (personnel PR, personnel hiring, personnel placement, org bds, hat compilations, hat library and hatting, hatting, hatting).

And by hatting and insisting on each doing his specialized job and getting seniors to HOLD THE FORM OF THE ORG by ordering the right orders to the right specialists and targeting their production and MAGIC! This amateur theatrical company gets solvent and good enough to wind up on Broadway. It's gone professional!

You say, yes, but what about artistic quality? What about the tech of writing music and acting . . .

Hey, you overlooked the first action. You kicked the door open on hiring and you hatted and trained. And you let go those who couldn't get a stat.

Eventually you would meet human reaction and emotion and would put in a full HCO and a full Qual particularly Cramming. But you'd still do that just to be sure it kept going.

Yessir, it can't help but become a professional group IF you, the Esto, established and made them HOLD THE FORM OF THE ORG and produce while they did it.

An Executive Director can do all this and produce too. The great ones do things like this. But here it is in full view.

A Scientology org goes together just like that. Which could be why, when we want to get something started, we say:

"Get the show on the road!"

But there is no show until it is established and the FORM OF THE ORG is held.

You are luckier than the amateur theatrical company's Esto. You have policy for every post and a book of it for every division and all the tech besides.

So there is no valid reason under the sun you cannot establish and then hold the form of the org.

HCO POLICY LETTER OF 21 AUGUST 1972

REMIMEO
HATTING OFFICER
HATS

ESTABLISHMENT OFFICER SERIES 27

EFFECTIVE HATTING

Here is a report from the Ship Programs Chief on Flag of the results obtained from following my orders on how to get Estos to hat people.

It should be noted that the procedure laid down by my despatch on the second half of this PL was exactly how I operated to develop the data used for Esto Series 16. (HCO PL 24 Apr. 72 I, HATTING THE PRODUCT OFFICER OF THE DIVISION)

THE REPORT

"Dear Sir,

"We have been having trouble getting Hatting Officers in Dept 1 to actually produce. They don't complete cycles of action to a result, they don't hat from the top down or hat for production. They don't seem to understand *why* they are hatting and what are the results they should achieve in hatting.

"This was the same problem we had back in May of this year in getting Estos to do effective hatting.

"At that time you sent me the attached despatch addressed to the Exec Esto. I used it faithfully and, with it, actually got hatting to occur.

"The results are still evident on the ship. With the DEO hatting per this despatch the then Dissem Division came right up in production and is still producing very well as the PR and Consumption Bureau.

"The Treasury Division improved markedly. Some improvement was attained in the Steward's Dept, Electronics and Qual Div where all Estos hatted per this despatch.

"All of these Estos had big wins hatting because I *used* the data on this despatch and forced them to persist with a hatting action to a RESULT.

"I kept a big logbook with each hatting cycle noted down. I insisted the Esto kept at *that* cycle until it was complete.

"Each division had its own program for hatting from the top down.

"Each exec and staff member had his or her own personal hatting program kept by the Esto. These were followed and checked off as they were done.

"A number of the blue-chip FSO crew now so valuable for Flag stability were *made* by heavy hatting last spring.

"I know the data on your despatch *works* if it is *done*.

"The Estos under me at the time first had to be *forced* to hat and to continue hatting to a *result*. Apparently their lack of confront had to be overcome by a hard driving senior.

"Generally, once they started getting results, they no longer had to be forced. They knew that Esto tech worked and willingly went ahead and applied it with vigor.

"Their confront was improved as well by doing Esto No. 16 drills on each other and running TRs 6–9 on each other every evening for at least an hour.

"Only by applying the principles laid out by you on the attached despatch was I able to get real hatting done by others.

"As we are having the same problem now with Hatting Officers in Dept 1, I feel that if this data were released as policy I could force it into use and get the ship hatted up faster."

GETTING HATTING DONE

Here is the despatch I wrote to the Exec Esto on Flag back in May of this year:

Inspections do not show Estos being industrious in their divs. They are more active than they were.

They are not hatting from the top down and not hatting to get production.

Basically they do not parallel the current push. They do little cycles down the org board.

A general grasp of what's needed and wanted is missing. Thus Estos are actually in or below Non-Existence and have not achieved upgrade from a new post or new system condition.

They are getting individual results in some cases. They are not integrated into the scene with what they are doing.

They would have to upgrade their handlings about 500 percent in order to actually effect a marked change in the org.

Inspections show only a small percent of Estos do Esto actions for a small period of time each day. They have other fish frying or are acting a bit confused.

If you had that many auditors and found them auditing pcs as seldom as Estos are found doing Esto actions the HGC stat would be nearly zero WDAH.

I know what I'm talking about here because I am piloting the system to find out why it isn't producing marked changes. I find that, with two messengers a watch of six hours, working myself part time on it, I have been able to get areas working. They were NOT producing under the attention of existing Estos.

The difference is, I force those I find not working at the top to actually produce and demand production from their staffs.

In doing this I have never crossed or found an Esto working on it. I *have* found two div heads who were refusing to be gotten going. Both of these I later got going.

Thus from my viewpoint:

a. It can be done with untrained Esto Commodore's Messengers.

b. I find messengers who know little of a meter can use one without coaching or training.

c. Production *can* be achieved by getting people to work.

d. That Estos have to be run and exactly ordered to do exactly so-and-so.

e. That in running Estos one has to keep track of what one is doing with them so one doesn't get a lot of half-dones. One has to make up for a lack of persistence.

Therefore I conclude:

A. One has to know what he is trying to build.

B. One has to target and direct its building.

C. One has to force in a persistence.

I also conclude that training of Estos is secondary to getting them to DO and that "lack of training" is an excuse not to do.

This is what I am learning about the system from actually working it.

The current on-board application of the system lacks planning, direction and persistence, does not hat from the top down and does not hat toward production. It MUST *BEGIN*.

HANDLING PTS AND OUT-ETHICS PERSONNEL

An Esto must know and be able to apply HCO PL 5 Apr. 72RD, PTS TYPE A HANDLING; HCO PL 3 May 72RA, Exec Series 12, ETHICS AND EXECUTIVES and HCOB 20 Apr. 72 II, C/S Series 78, PRODUCT PURPOSE AND WHY AND W/C ERROR CORRECTION.

I recently found an org where Division 2 and Division 6 refusals and inactivities were ruining GI. The Why behind this was a downgrade of importance of both divisions and a confusion between them. The Ethics Why was that SPs and PTSes were running "can't haves" of Scientology on the org and public.

An Esto must be able to spot out-ethics and PTS/SP phenomena and effectively deal with it.

ADMINISTRATIVE SKILL

An administrator is one who can make things happen at the other end of a communication line which result in discovered data or handled situations.

A very good administrator can get things handled over a very long distance. A mediumly skilled administrator has a shorter reach.

As this scale declines, we get people who can make things happen only at arm's length.

It is interesting that administrators are valued in direct proportion to the distance they can reach and get things handled over. Persons who can handle things only at arm's length are valued but not in proportion to a long-reaching administrator.

The complexity of situations and things handled is also a test of the administrator. If one began at the highest level of capability of handling things thousands of miles away and at the bottom of the scale handling things at arm's length, one would also find complexity entering the picture.

The artisan can, by means of heavy MEST communication lines and tools, make all manner of things occur but mostly within his visual sight line.

The day laborer who can only handle a shovel usually can only handle the simplicity of lifting a few pounds of dirt to a definite position.

One of the troubles PTS people have, as an example, is handling something over a long-distance communication line. One can tell them to handle the suppressive, but one must realize he may also be giving the order to someone to handle another person several thousand miles away. This is a high level of administrative skill and is usually no part of a PTS's ability, whatever other technical considerations may intervene.

Estimating situations thousands of miles away and handling them terminatedly is actually comparable to an OT ability.

There is no effort here to include artists and technicians who do work with their hands, for this is another class of activity requiring enormous technical skill and ability.

However, very few people understand the administrator or what he is or what he can do, yet the whole world is the effect of good or bad administrators.

The administrator has technology with which to discover and handle situations and if he is a very good administrator his handling is ordinarily constructive; but whatever it is, it is firm.

A skilled administrator therefore can be defined as ONE WHO CAN ESTABLISH AND MAINTAIN COMMUNICATION LINES AND CAN THEREBY DISCOVER, HANDLE AND IMPROVE SITUATIONS AND CONDITIONS AT A DISTANCE.

When you fully grasp this and realize it is the basic simplicity that is the basic all of an administrator's further complex technology, you can estimate an administrator's efficiency or effectiveness.

If you are engaged in administration, this basic truth will serve you very well if you fully understand it and use it.

ESTO SERIES 30

All persons doing Esto work may only use the title "Esto I/T" (In-Training) until he has successfully and honestly completed:

1. HCOB 21 Nov. 73, THE CURE OF Q AND A.
2. The PRD (Primary Rundown).
3. The OEC.
4. The Esto Series.
5. Has shown on post the ability to see situations and handle them terminatedly.
6. Gets staff members actually producing by increased stats.

Any reasons for failure of the Esto system anywhere have derived from (a) a dishonest "completion" of the PRD and (b) Qing and Aing instead of seeing and handling situations terminatedly.

An Esto must be at CAUSE.

PRODUCT–ORG OFFICER SYSTEM
NAME YOUR PRODUCT

The product–org officer system, covered fully in Flag Executive Briefing Course tapes, contains the key phrase for any product officer. This is:

NAME, WANT AND GET YOUR PRODUCT.

Breaking this down into its parts we find that the most common failure of any product officer or staff member or Purchaser lies in the first item, NAME YOUR PRODUCT!

On org boards and even for sections, one has products listed. Departments have valuable final products. Every staff member has one or more products.

IF PRODUCTION IS NOT OCCURRING, THE ABILITY TO NAME THE PRODUCT IS PROBABLY MISSING.

Misunderstood post titles were collected once on a wide survey. Whenever it was found a staff member did not seem to be able to do his job, it was checked whether he knew the definition of the word — or words — that made up his post title. It was found, one for one, that he could not define it even though no unusual or special definition was being requested. In other words, the first thing about the post could not be defined — the post title. This may seem incredible, but only until you yourself check it out on staff that habitually goof.

The ability to NAME the product required goes further than a mere, glib definition. Some engineers once drove a Purchaser halfway up the wall by glibly requesting "one dozen bolts." The Purchaser kept bringing back all different thicknesses and lengths and types of bolts. The Purchaser was going daffy and so were the engineers. Until the engineers were forced to exactly name what they were seeking by giving it ALL its name. The Purchaser trying to purchase could not possibly obtain his product without being able to FULLY name it. Once this was done, nothing was easier.

A product officer can ask, beg, plead, yell for his product. But maybe he isn't naming it! Maybe he isn't naming it fully. And maybe even he doesn't know the name of it. A product officer should spend some time exactly and accurately naming the

exact product he wants before asking for it. Otherwise he and his staff may be struggling around over many misunderstood words!

When you see a staff whirling around and dashing into walls and each other and not producing a thing, calmly try to find out if any of them or their product officer can NAME what products they are trying to produce. Chances are, few of them can and maybe the product officer as well.

Handle and it will all smooth out and products will occur.

ADMIN KNOW-HOW SERIES 34
ESTABLISHMENT OFFICER SERIES 32

PRODUCT–ORG OFFICER SYSTEM
WANT YOUR PRODUCT

A product officer has to name, WANT and get his product.

Where no real or valuable production is occurring, one has to ask the question, does the product officer really WANT the product he is demanding? And does the staff member or members he is dealing with WANT the product?

The reason that a psychotic or otherwise evilly intentioned person cannot achieve anything as a product officer or staff member is that he does NOT want the product to occur. The intentions of psychos are aimed at destruction and not at creation.

Such persons may SAY they want the product but this is just "PR" and a cover for their real activities.

People who are PTS (potential trouble sources by reason of connections with people antagonistic to what they are doing in life) are all too likely to slide into the valence of the antagonistic person who definitely would NOT want the product.

Thus, in an org run by or overloaded with destructive persons or PTS persons, you see a very low level of production if you see any at all. And the production is likely to be what is called "an overt product," meaning a bad one that will not be accepted or cannot be traded or exchanged and has more waste and liability connected with it than it has value.

One has to actually WANT the product he is asking for or is trying to produce. There may be many reasons he does not, none of which are necessarily connected with being psycho. But if it is a creative and valuable product and assists his and the survival of others and he still does not want it, then one should look for PTSness or maybe even a bit of psychosis. And at the least, some withholds.

One does not have to be in a passionate, mystic daze about wanting the product. But one shouldn't be moving mountains in the road of a guy trying to carry some lumber to the house site either.

The question of WANT the product has to be included in any examination of reasons why a person or an org isn't producing.

ADMIN KNOW-HOW SERIES 35
ESTABLISHMENT OFFICER SERIES 33

PRODUCT–ORG OFFICER SYSTEM TO GET YOU HAVE TO KNOW HOW TO ORGANIZE

A product officer and ESPECIALLY an org officer has to know how to GET a product.

All science and technology is built around this single point in the key phrase "Name, want and get your product." Managers and scientists specialize in the HOW TO GET part of it and very often neglect the rest.

There are many product officers who do NOT know enough about organization to organize things so they actually GET their product. These, all too often, cover up their ignorance on how to organize or their inability to do so by saying to one and all, "Don't organize, just produce!" When you hear this you can suspect that the person saying it actually does not know the tech or know-how of organizing or how to put an organization together. He may not even know enough about organizing to shove aside other paper on his desk when he is trying to spread out and read a large chart — yet that is simple organization.

A bricklayer would look awfully silly trying to lay no-bricks. He hasn't got any bricks. Yet there he is going through the motions of laying bricks. It takes a certain economic and purchasing and transport tech to get the bricks delivered — only then can you lay bricks.

A manager looks pretty silly trying to order a brick wall built when he doesn't have any bricks or bricklayer and provides no means at all of obtaining either one.

A product officer may be great at single-handing the show. How come? He doesn't realize that building a show comes before one runs it. And even though economics demand at least a small show before one builds a large show, a very bad product officer who can't really organize either, will, instead of making the small show bigger, make the small show smaller by trying to run a no-show.

There is a HOW of organization. It is covered pretty well in the Org Series and elsewhere. Like you can't put in comm lines unless you put in terminals for them to connect with. Like you can't get particles flowing in a profitable way unless they have something for them to run *on*. That's simply the way things go in the universe in which you are operating. Now of course you could build a new universe with

different laws but the fact is, that would require a knowledge of organization as well, wouldn't it?

The tech of how to produce something can be pretty vast. One doesn't have to be a total expert on it to be able to manage the people doing it, but one has to have a pretty good idea of how it goes and know enough NOT to stop the guys who do know how to make bricks when one wants bricks.

If the product is to get somebody to come in to see you, then you have to have some means of communication and some tech of persuasion to make him want to come in to see you. Brute force may seem okay to cops but in organization it seldom works. There is more tech to it than that.

If a product officer does not know there is tech involved in GETTING the product, then he will never make his staff study it or teach anybody to do it. And he will wind up with no product. So beware the product officer who won't give time off for hatting! He doesn't know one has to know the tech of getting his product. What do you think the OEC (Org Exec Course) Volumes and the technical bulletins are all about?

One has to spend some time organizing in many different ways — the organization itself, the hatting, the technical skill staff members would have to have, to get anywhere in GETTING a product.

Sure, if you only organize and never produce you never get a product either. But if you only produce and never organize, the only brick wall you'll ever see is the one you run into.

MISTAKES

A new piece of Esto tech has come into view:

He who cannot be hatted will not learn by mistakes.

REPEATING MISTAKES

It isn't making mistakes that is actionable; it is failing to learn from them and repeating them.

We know in auditor training that we retread somebody who commits the same mistake twice but this is not true in any other area.

A failed student is apparently somebody who can't be hatted either and he is detected by somebody who makes the same mistake over and over and doesn't correct himself.

Thus it's possible to detect a failed student by somebody who makes the same mistake.

We are not unduly concerned with somebody who is unhatted. We are only concerned with people who cannot be hatted and these are easiest to detect by observing when they make the same mistakes without correcting themselves. This person is not only dangerous on lines but also frankly can't be utilized.

This could be classified as a new phenomenon, part of the cultural mess that has caught up with us.

For example, four people recently taken out of a Special Unit of a Filming Project not only couldn't apply tech standardly on which they were fully hatted but also couldn't learn from their mistakes. As a consequence their redone work contained the same mistakes that were originally made.

So this apparency of not being able to get anyplace with the unit was due to several people who could not learn by their mistakes as well as could not be hatted.

This is a new view of a failed student — it wasn't whether they studied, it was just that they couldn't be hatted and kept repeating the same mistakes, even some new ones, and they couldn't learn about their equipment.

This also connects with disassociation phenomenon in that the person does not connect the mistake he just made with the last time he made that mistake or why or what effect it created or how and why to prevent it occurring again.

SUMMARY

Where you have someone who does not learn from his mistakes and cannot be hatted, it is better to replace the person rather than just hope.

WORD CLEARING SERIES 60

MISUNDERSTOOD WORDS AND CYCLES OF ACTION

MISUNDERSTOOD WORDS AND NO PRODUCT

A misunderstood word can prevent a person from understanding the remainder of what is heard or written.

I have now discovered that: A MISUNDERSTOOD on any given subject CAN PREVENT THE COMPLETION OF A CYCLE OF ACTION related to that subject.

Therefore, those people who don't complete cycles of action on certain subjects have a misunderstood word on them.

This then results in no-product situations.

Therefore, when you are getting no product, look for the misunderstood word on the subject no matter how long and arduous it is. It's there. And when it's found the person can go on and complete a cycle of action and get a product.

CAUTION: Make sure the person actually does have an inability to complete a cycle of action *before* you get into handling him. You don't handle somebody who *is* completing cycles of action that result in production.

MISUNDERSTOODS AND PERCEPTION

Misunderstoods can also act as perception shut-offs. They can actually interrupt a person's perception.

It is quite astonishing that perceptions such as sight, sound and even touch can be shut off by Mis-U words.

This opens the door to the fact that people apparently do not see, hear, notice or handle outnesses when they have Mis-Us on them.

This also may open the door to people who have perceptic shut-offs, such as poor eyesight, deafness or other perception difficulties.

MISUNDERSTOODS AND COMPLEXITY

Misunderstoods lead to complexity. People who have Mis-Us in an area are inclined to develop vast complexities. They can generate confusions and complexities beyond belief.

People do this because, having misunderstoods, they do not confront and duplicate in the area and so get into a lot of think-think and unnecessary significance. Their ability to get things done in that area dwindles as a result. And at the bottom of all this is simply misunderstood words.

MISUNDERSTOODS AND TOTAL ORGANIZE

When you see an area that is organizing only, you know that area is loaded with misunderstoods.

When people have incomplete cycles due to Mis-Us, they get bogged down into organization.

You can tell when people have Mis-Us — they are totally involved in organize, organize, organize. They don't know what they are doing.

There is a level below this — they have overts and withholds which prevent even organizing.

Below that level people are PTS.

Lacking a sense of organization actually lies below this. It is below the level of Mis-Us, overts and withholds and PTSness — and you'd have to go north through PTSness and overts and withholds to even get to the Mis-Us.

MISUNDERSTOODS AND NO ORGANIZE

There can also exist a condition where someone does not organize any corner of his area or work or organizations or lines. This manifests itself by irrational demands to only produce and to prevent any organization so that production can occur. At the bottom of this you are very likely to find misunderstood words, particularly on the purpose of the production or why one is producing. It is in this sector that you get overt products most frequently.

HANDLING

The exact procedure for handling these Mis-Us is given in HCOB 17 June 79, CRASHING MIS-Us: THE KEY TO COMPLETED CYCLES OF ACTION AND PRODUCTS. Crashing Mis-U Finding is done as part of HCO PL 23 Aug. 79 I, DEBUG TECH. Additional data on the location of Crashing Mis-Us is found in HCOB 23 Aug. 79 I, CRASHING MIS-Us, BLOCKS TO FINDING THEM and HCOB 16 July 79, THE "ELUSIVE" MIS-U OR CRASHING MIS-U.

With this knowledge we can now handle all the factors that prevent the completion of cycles of action and products.

FALSE DATA STRIPPING

Refs:
The Study Tapes
DAB Vol 1, Nos. 1–2 STANDARD PROCEDURE (Tech Vol I)
DAB Vol 1, No. 3 HOW TO RELEASE A CHRONIC SOMATIC (Tech Vol I)
Book: *Notes on the Lectures,* Chapters 7 and 13

When a person is not functioning well on his post, on his job or in life, at the bottom of his difficulties will often be found *unknown* basic definitions and laws or *false* definitions, false data and false laws, resulting in an inability to think with the words and rules of that activity and an inability to perform the simplest required functions. The person will remain unfamiliar with the fundamentals of his activity, at times appearing idiotic, because of these not-defined and falsely defined words.

Verbal hatting is the main source of false definitions and false data. Someone who "knows" tells someone else a definition or a datum. The person now thinks he knows the definition (even though nothing in the field makes any sense to him). The word may not even read on the meter during misunderstood checks because the person "thinks he knows."

A politician is told by an adviser, "It doesn't matter how much money the government spends. It is good for the society." The politician uses this "rule" and the next thing you know inflation is driving everybody to starvation and the government to bankruptcy. The politician, knowing he was told this on the very best authority, does not spot it as false data but continues to use it right up to the point where the angry mobs stand him up in front of a firing squad and shoot him down. And the pity of it is that the politician never once suspected that there was anything false about the data, even though he couldn't work with it.

There is no field in all the society where false data is not rampant. "Experts," "Advisers," "Friends," "Families" seldom go and look at the basic texts on subjects, even when these are known to exist, but indulge in all manner of interpretations and even outright lies to seem wise or expert. The cost in terms of lost production and damaged equipment is enormous. You will see it in all sectors of society. People cannot think with the fundamentals of their work. They goof. They ruin things. They have to redo what they have already done.

You'll find people whose estimate of the environment is totally perverted to the point they're walking around literally in a fog. The guy looks at a tree and the reality of the tree is blurred by the "fact" that "trees are made by God" so he won't take care of the tree because he is convinced.

What we're trying to cure in people is the inability to think with data. This was traced by me to false data as a phenomenon additional to misunderstood words, although the misunderstood word plays a role in it and will have to be allowed for.

When a person is having difficulty in an area or on a post, when he can't seem to apply what he has "learned" or what he is studying or when he can't get through a specific drill or exercise in his training materials, you would suspect he has false data in that area or on those materials. If he is to use it at all effectively he must first sort out the true facts regarding it from the conflicting bits and pieces of information or opinion he has acquired. This eliminates the false data and lets him get on with it.

INABILITY TO HAT

We are looking here at a brand-new discovery I have made which is that it can be nearly impossible to hat anyone who is sitting on false data on the subject you are trying to hat him on. This is the *primary* reason people cannot be hatted, and False Data Stripping, therefore, enables a person to be hatted even though other approaches have failed. This is a very valuable discovery — it solves the problem of inability to hat or train.

SOURCES

False data on a subject can come from any number of sources. In the process of day-to-day living people encounter and often accept without inspection all sorts of ideas which may seem to make sense but don't. Advertising, newspapers, TV and other media are packed with such material. The most profound false data can come out of texts such as Stanislavsky (a Russian actor and director); and even mothers have a hand in it, such as "children should be seen and not heard."

Where a subject, such as art, contains innumerable authorities and voluminous opinions, you may find that any and all textbooks under that heading reek with false data. Those who have studied study tech will recall that the validity of texts is an important factor in study. Therefore, it is important that any Supervisor or teacher seeking to use False Data Stripping must utilize basic *workable* texts. These are most often found to have been written by the original discoverer of the subject and, when in doubt, avoid texts which are interpretations of somebody else's work. In short, choose

only textual material which is closest to the basic facts of the subject and avoid those which embroider upon them.

It can happen, if you do False Data Stripping well and expertly without enforcing your own data on the person, that he can find a *whole* textbook false — much to his amazement. In such a case, locate a more fundamental text on the subject. (Examples of false texts: Eastman Kodak; Lord Keynes' treatises on economics; John Dewey's texts on education; Sigmund Freud's texts on the mind; the texts derived from the "work" of Wundt [Leipzig 1879 — Father of Modern Psychology]; and [joke] a textbook on "Proper Conduct for Sheep" written by A. Wolf.)

USE OF FALSE DATA STRIPPING

False Data Stripping should be used extensively in all hatting and training activities. Current society is riddled with false data and these must be cleared away so that we can hat and train people. Then they will be able to learn useful data which will enable them to understand things and produce valuable products in life.

False Data Stripping can be done on or off the meter. It can be done by an auditor in session, by a Supervisor, Cramming Officer or Word Clearer or by an exec, Esto or any administrator. Students and staff can be trained to do it on each other.

Not a lot of training is required to deliver this procedure but anyone administering it must have checked out on this HCOB/PL and have demoed and drilled the procedure. If it is going to be done on the meter (which is preferable), the person doing it must have an okay to operate an E-Meter.

GRADIENTS

It will be found that false data actually comes off in gradients.

For example, a student handled initially on false data on a particular drill will appear to be complete on it. He goes on with his studies and makes progress for a while and then sometimes he will hit a bog or slow in his progress. This is usually an indication that more false data has been flushed up (restimulated or remembered as a result of actually doing studies or drills). At that point more basic false data will come off when asked for. The reason for this is when you first give a student false data handling, he doesn't know enough about the subject to know false data from the true. When he has learned a bit more about the subject he then collides with more false data hitherto buried. This can happen several times, as he is getting more and more expert on the subject.

Thus, the action of stripping off false data can and must be checked for and used in any training and hatting. The rundown has to be given again and again at later and later periods, as a student or staff member may come up against additional faulty data that has been not-ised. It can be repeated as often as necessary in any specific area of training until the person is finally duplicating and is able to use the correct tech and *only* the correct tech exactly.

THEORY

There is a philosophic background as to why getting off false data on a subject works and why trying to teach a correct datum *over* a false datum on the subject does not work. It is based on the Socratic thesis-antithesis-synthesis philosophical equation.

Socrates: 470 B.C.–399 B.C. A great Greek philosopher.

A *thesis* is a statement or assertion.

Antithesis: opposing statement or assertion.

The Socratic equation is mainly used in debate where one debater asserts one thing and the other debater asserts the opposite. It was the contention of Socrates and others that when two forces came into collision a new idea was born. This was the use of the equation in logic and debate. However, had they looked further they would have seen that other effects were brought into play. It has very disastrous effects when it appears in the field of training.

Where the person has acquired a *false* thesis (or datum), the *true* datum you are trying to teach him becomes an antithesis. The true datum comes smack up against the false datum he is hanging on to, as it is counter to it.

In other words, these two things collide, and *neither one* will then make sense to him. At this point he can try to make sense out of the collision and form what is called a synthesis, or his wits simply don't function. (*Synthesis:* a unified whole in which opposites, thesis and antithesis, are reconciled.)

So you wind up with the person either:

a. attempting to use a false, unworkable synthesis he has formed, or

b. his thinkingness locks up on the subject.

In either case you get an impossible-to-train, impossible-to-hat scene.

GLIBNESS

Probably we have here the basic anatomy of the "glib student" who can parrot off whole chapters on an examination paper and yet in practice uses his tools as a doorstop. This student has been a mystery to the world of education for eons. What he has probably done in order to get by is set up a circuit which is purely memory. The truth of it is his understanding or participation is barred off by considerations such as "nothing works anyway but one has to please the professor somehow."

The less a person can confront, the more false data he has accumulated and will accumulate. These syntheses are simply additives and complexities and make the person complicate the subject beyond belief. Or the collision of false data and true data, without the person knowing which is which, makes him look like a meathead.

Therefore, in order to cure him of his additives, complexities, apathy and apparent stupidity on a subject, in addition to cleaning up misunderstood words, it is necessary

to strip the false data off the subject. Most of the time this is prior to the true data and so is basic on the chain. Where this is the case, when that basic false data is located and stripped the whole subject clears up more easily.

FALSE DATA PRONE

Some people are prone to accepting false data. This stems from overts committed prior to the false data being accepted. The false data then acts as a justifier for the overt.

An example of this would be a student studying past Mis-Us on a subject, cheating in the exam and eventually dropping the subject entirely. Then someone comes along and tells him that the subject is useless and destructive. Well, he will immediately grab hold of this datum and believe it as he needs something to justify his earlier overts.

This actually gets into service facsimiles as the person will use the false data to make the subject or other people wrong.

So if you see someone who is very prone to accepting false data on a particular subject or in general, the answer is to get the prior overts pulled. Then the person will not need to justify his overts by accepting any false data that comes his way.

PROCEDURE

You may not easily be able to detect a false datum because the person believes it to be true. When False Data Stripping is done on a meter the false datum won't necessarily read for the same reason.

You therefore ask the person if there is anything he has run across on the subject under discussion which he couldn't think with, which didn't seem to add up or seems to be in conflict with the material one is trying to teach him.

The false datum buries itself and the procedure itself handles this phenomenon.

When the false datum is located it is handled with elementary recall based on 1950 Straightwire. Straight memory technique or Straightwire (so called because one is stringing a line between present time and some incident in the past and stringing that line directly and without any detours) was developed originally in 1950 as a lighter process than engram running. Cleverly used, Straightwire removed locks and released illnesses without the pc ever having run an engram.

Once one had determined whatever it was that was going to be run with Straightwire, one would have the pc recall where and when it happened, who was involved, what were they doing, what was the pc doing, etc., until the lock blew or the illness keyed out.

Straightwire works at a lock level. When overdone it can key in underlying engrams. When properly done it can be quite miraculous.

A. Determine whether or not the person needs this procedure by checking the following:

1. The person cannot be hatted on a subject.
2. No Crashing Mis-Us can be found on a subject yet it is obvious they exist.
3. The person is not duplicating the material he has studied as he is incorrectly applying it or only applying part of it, despite Word Clearing.
4. He is rejecting the material he is reading or the definition of the word he is clearing.
5. You suspect or the person originates earlier data he has encountered on the materials that could contain false data.
6. The person talks about or quotes other sources or obviously incorrect sources.
7. He is glib.
8. The person is backing off from actually applying the data he is studying despite standard Word Clearing.
9. He is bogged.
10. He cannot think with the data and it does not seem to apply.

B. Establish the difficulty the person is having — i.e., what are the materials he can't duplicate or apply? These materials must be to hand and the person must be familiar with the basic true data on the subject being addressed.

C. If the action is being done metered, put the person on the meter and properly adjust the sensitivity with a proper can squeeze.

D. Thoroughly clear the concept of false data with the person. Have him give you examples to show he gets it. (This would be done if the person was receiving False Data Stripping for the first time.)

E. The following questions are used to detect and uncover the false data. These questions are cleared before they are used for the first time on anyone. They do not have to read on a meter and may not do so as the person will not necessarily read on something that he believes to be true.

1. **Is there anything you have run across in** (subject under discussion) **which you couldn t think with?**
2. **Is there anything you have encountered in** (subject under discussion) **which didn t seem to add up?**
3. **Is there something you have come across in** (subject under discussion) **that seems to be in conflict with the material you are trying to learn?**

4. **Is there something in** (subject under discussion) **which never made any sense to you?**

5. **Did you come across any data in** (subject under discussion) **that you had no use for?**

6. **Was there any data you came across in** (subject under discussion) **that never seemed to fit in?**

7. **Do you know of any datum that makes it unnecessary for you to do a good job on this subject?**

8. **Do you know of any reason why an overt product is all right?**

9. **Would you be made wrong if you really learned this subject?**

10. **Did anyone ever explain this subject to you verbally?**

11. **Do you know of any datum that conflicts with standard texts on this subject?**

12. **Do you consider you really know best about this subject?**

13. **Would it make somebody else wrong not to learn this subject?**

14. **Is this subject not worth learning?**

The questions are asked in the above sequence. When an area of false data is uncovered by one of these questions, one goes straight on to step F — location.

F. When the person comes up with an answer to one of the above questions, locate the false datum as follows:

1. Ask, **Have you been given any false data regarding this?** and help him locate the false datum. If this is being done on the meter, one can use any meter reads one does get to steer the person. This may require a bit of work, as the person may believe the false data he has to be true. Keep at it until you get the false datum.

If the person has given you the false datum in step E, then this step will not be needed; just go straight on to step G.

G. When the false datum has been located, handle as follows:

1. Ask, **Where did this datum come from?** (This could be a person, a book, TV, etc.)

2. **When was this?**

3. **Where exactly were you at the time?**

4. **Where was** (the person, book, etc.) **at the time?**

5. **What were you doing at the time?**

6. If the false datum came from a person, ask, **What was** (the person) **doing at the time?**

7. **How did** (the person, book, etc.) **look at the time?**

8. If the datum has not blown with the above questions, ask, **Is there an earlier-similar false datum or incident on** (the subject under discussion)**?** and handle per steps 1–7.

Continue as above until the false datum has blown. On the meter you will have a floating needle and very good indicators.

DO NOT CONTINUE PAST A POINT WHERE THE FALSE DATUM HAS BLOWN.

If you suspect the datum may have blown but the person has not originated, then ask, **How does that datum seem to you now?** and either continue if it hasn't blown or end off on that datum if it has blown.

H. When you have handled a particular false datum to a blow, going earlier-similar as necessary, you would then go back and repeat the question from E (the detection step) that uncovered the false datum. If there are any more answers to the question, they are handled exactly as in step F (location) and step G (handling).

That particular question is left when the person has no more answers. Then, if the person is not totally handled on the subject under discussion, one would use the other questions from step E and handle them in the same way. All the questions can be asked and handled as above but one would not continue past a point where the whole subject has been cleared up and the person can now duplicate and apply the data he has been having trouble with.

I. *CONDITIONAL:* If False Data Stripping is being done in conjunction with Crashing Mis-U Finding, one would now proceed with the Crashing Mis-U Finding.

J. Send the person to the Examiner.

K. Have the person study or restudy the true data on the subject you have been handling.

END PHENOMENA

When the above procedure is done correctly and fully on an area the person is actually having difficulty with, he will end up able to duplicate, understand and apply and think with the data that he could not previously grasp. The false data that was standing in the road of duplication will have been cleared away and the person's thinking will have been freed up. When this occurs, no matter where in the procedure, one ends off the False Data Stripping on that subject and sends the person to the Examiner. He will have cognitions and VGIs and on the meter you will have an F/N. This is not the end of all False Data Stripping for that person. It is the end of that False Data Stripping on the person at that particular time. As the person continues to work with and study the subject in question, he will learn more about it and may again collide with false data, at which time one repeats the above process.

NOTE

False data buries itself as the person may firmly believe that it is true. Sometimes the person will have such faith in a particular person, book, etc., that he cannot conceive that any data from that particular source might be false. One artist being false data stripped had received some false data from a very famous painter. Even though the data didn't really add up and actually caused the artist tremendous problems, he tended to believe it because of where it came from. It took persistence on the part of the person administering the False Data Stripping to eventually blow this false datum with a resulting freeing up of the artist's ability to think and produce in the area.

MISUNDERSTOODS

Misunderstoods often come up during False Data Stripping and should be cleared when they do. One would then continue with the False Data Stripping. One person being false data stripped knew he had some false data from a particular source but the false datum was a complete blank — he couldn't remember it at all. It was discovered that he had a Mis-U just before he received the false data and as soon as this was cleared up, he recalled the false data and it blew. This is just one example of how Word Clearing can tie in with False Data Stripping.

REPEATED USE

False Data Stripping can be done over and over as it will come off in layers as mentioned before. If False Data Stripping has been done on a specific thing and at some later point the person is having difficulty with a drill or the materials, the stripping of false data should be done on him again. In such a case it will be seen that the person recognizes or remembers *more* false or contrary data he has accumulated on the subject that was not in view earlier. As he duplicates a drill or his materials more and more exactly, former "interpretations" he had not-ised, incorrect past flunks that acted as invalidation or evaluation, etc., may crop up to be stripped off.

CAUTIONS

CODE. False Data Stripping is done under the discipline of the Auditor's Code. Evaluation and invalidation can be particularly harmful and must be avoided. All points of the Code apply.

RUDIMENTS. One would not begin False Data Stripping on someone who already has out-ruds. If the person is upset or worried about something or is critical or nattery, then you should fly his ruds or get them flown before you start False Data Stripping.

OVERRUN. One must be particularly careful not to overrun the person past a blow of the false datum. The stress in recall is that it is a light action which does not get the person into engrams or heavy charge. Keep it light. If you overrun someone past the point of a blow, he may drop into engrams or heavy charge. Just take the recall step to a blow and don't push him beyond it.

DATE/LOCATE. Date/Locate is another way of getting something to blow. If a false datum does not blow on the recall steps despite going earlier-similar, then it could be

handled with Date/Locate *in session* as ordered by the C/S. This would normally be done as part of a False Data Stripping Repair List. Date/locating false data would never be done except in session as ordered by the C/S or as directed by the False Data Stripping Repair List. The auditor must be totally star-rated on date and locating and practiced in it before he attempts it.

FALSE DATA STRIPPING REPAIR LIST. The False Data Stripping Repair List is used in session by an auditor when False Data Stripping bogs inextricably or the person is not F/N GIs at Exams or gets in trouble after False Data Stripping has been done. A bogged False Data Stripping session must be handled within twenty-four hours.

NEW STUDENTS. Students who are new to Scientology should not use this procedure on each other as they may be insufficiently experienced to deliver it competently. In this case the Supervisor or someone qualified would administer False Data Stripping to those students who need it.

SUMMARY

The problem of the person who is unable to learn or who is unable to apply what he learns has never been fully resolved before. Misunderstoods were and are a major factor and Word Clearing must be used liberally. Now, however, I have made a major breakthrough which finally explains and handles the problem of inability to learn and apply.

Man's texts and education systems are strewn with false data. These false data effectively block someone's understanding of the true data. The handling given in this HCOB/PL makes it possible to remove that block and enable people to learn data so they can apply it.

With the ability to learn comes stability and the production of valuable products. With stability and the production of valuable products comes the achievement of one's purposes and goals, high morale and happiness.

So let's get to work on stripping away the false data which plagues man, clogs up his ability to think and learn and reduces his competence and effectiveness. Let's increase the ability of individuals and the human race.

The post of SERVICE PRODUCT OFFICER is hereby established in the Office of the CO/ED, Dept 19, of all Class IV and Sea Org orgs. His direct senior is the CO/ED.

Until such time as a SERVICE PRODUCT OFFICER is posted the responsibilities and duties are covered by the Service/Call-in Committee as fully laid out in HCO PL 9 Aug. 79 I, CALL–IN: THE KEY TO DELIVERY AND FUTURE INCOME and HCO PL 9 Aug. 79 III, SERVICE CALL–IN COMMITTEE.

The VALUABLE FINAL PRODUCTS of this post are (1) flawlessly serviced and completed paid pcs and students who re-sign up for their next service, and (2) high quality promotional items in the hands of volumes of public who come in, sign up and start an org service.

The main statistics for the SERVICE PRODUCT OFFICER are:

1. Number of pcs and students completed and re-signed on to their next service. (This includes those actually routed on to the next upper org for services and who do re-sign.)

2. Number of public in and started on to a service.

Completion: By completion is meant those actions completed and attested at C&A and accompanied by an acceptable success story.

Re-sign: By re-sign-ups are meant pcs and students who, after completion of a service, see the Registrar to sign up *again* for another service while in the org.

Promotional Items: Those items which will produce income for the organization. By promotional items are meant those things which make Scientology and our products known and will cause people to respond either in person or by written reply to the result of receiving Scientology commodities. These are: tours, book outlets, Sunday services, events, upstat image, fliers, info packs, handouts, books, ASR packs, specified service promotion, etc.

There are of course many other stats that reflect the SERVICE PRODUCT OFFICER'S subproducts and these are: VSD, TOTAL GI, INTENSIVES COMPLETED, BULK MAIL OUT, NUMBER OF PROMOTIONAL ACTIONS OF THE ORG IN, NUMBER OF FULLY AND PARTIAL PAIDS GOTTEN INTO THE ORG AND ON TO THEIR NEXT SERVICE. These are very important parts of the SERVICE PRODUCT OFFICER HAT, as they reflect his subproducts which lead to his valuable final product.

SERVICE PRODUCT OFFICER RESPONSIBILITIES AND DUTIES

The purpose of an organization is to deliver service to the public. The primary functions which add up to delivery to the public are: promotion, sales, call-in, delivery itself and re-sign. The Service Product Officer is responsible for the flow of *products* through these areas. He is a *product officer*. He names, wants and gets products in these areas and thus ensures that the organization is accomplishing its purpose of service to the public.

The full technology of product officers is explained in the Flag Executive Briefing Course lectures, where the product–org officer system was developed. This system is still fully valid and is, in fact, the tech of the Service Product Officer. He is solely interested in products. When the Service Product Officer comes across a situation that

requires organizing, he gets his organizing officer to handle it. The O/O (organizing officer) should actually be operating a few steps ahead of the Service Product Officer at all times — organizing for immediate production, per the product–org system. A full study of the product–org system, as contained in the FEBC tapes, the Org Series and AKH Series 33, 34 and 35, NAME, WANT AND GET YOUR PRODUCT is recommended in order to attain a thorough understanding of the actions of the Service Product Officer and his organizing officer.

The Service Product Officer is not a stopgap at any point of the promotion, sales, call-in, delivery and re-sign lines, where executives have failed to post and hat staff. This would be the responsibility of the Exec Establishment Officer per Esto Series 1. Establishment Officers see that short- and long-range establishment are occurring in the organization in the form of recruiting, hatting and training of staff. The Esto system is a necessary and very vital tool for the Service Product Officer and the organization and should definitely be in full use.

The Service Product Officer has the authority to directly order or work with any terminal involved in the promotion, sales, call-in, delivery or re-sign areas so long as he maintains direct liaison with their seniors.

The Service Product Officer must be fully aware of every post in the org and what their jobs consist of. He must know who handles what cycles and what cycles are on the lines. For instance, it is up to the Service Product Officer to be aware of all promotional actions occurring in the org and who is doing them, or if they aren't getting done. He must be aware of what public aren't getting serviced and he ensures those responsible get them serviced. He doesn't do this himself, as a serious goof of any product officer would be to go down the org board and do the job himself. The Service Product Officer *must* ensure others get the work done. Otherwise, he would wind up doing everyone's post and not getting anything done. It's actually pretty overwhelming to think of a Service Product Officer as responsible for doing everyone else's post duties. That's the surefire way to sink fast. Where a product isn't getting out the Service Product Officer debugs it using HCO PL 23 Aug. 79R I, DEBUG TECH, in order to get production. He is not interested in first finding the person's Mis-U or excuse, he is interested in getting production occurring now. Let the org officer and Qual worry about the staff member's Mis-Us.

Divisional Secretaries are the product officers for their division per the product–organizing officer system. The Service Product Officer sees that the product officers over the whole delivery cycle are getting their products. He coordinates the flow of products from division to division. A Service Product Officer doing his post fully and properly is, in fact, the person that makes the org board work. He sees that products aren't jamming up at one point of the line, but that they continue through the organization.

The Service Product Officer walks into the Tech Div and finds the Tech Sec sitting at his desk, shuffling paper and the pcs are piling high and complaining about no service. The last thing the Service Product Officer would do is start organizing the Tech staff around and scheduling the pcs. No sir, that's a serious offense. The first thing he would do is find out what can be produced RIGHT NOW, what auditors can be gotten into session right now and make the Tech Sec do it and GET IT DONE. This all takes about fifteen minutes and he gets the area flowing again and then,

WHAM! . . . he's out and into his next area. The Service Product Officer would not sit down and just start word clearing or doing Exchange by Dynamics on the Tech Sec. He would unstick the flows and get them moving. Then he would alert HCO and Qual to this serious problem of unhattedness and demand it be handled.

The basic sequence of the Service Product Officer on getting the products flowing off the lines is PUSH, DEBUG, DRIVE, NAME IT, WANT IT, AND GET IT. That's the only way you ever get a product. Products don't happen on their own.

This means he tells the Tech Sec to get Joe Blow there in session now! There is no general "audit these pcs." You'd never get a product that way.

The CO/ED has no authority to order the Service Product Officer to perform the total duties of any one post. The Service Product Officer must guard against being stuck into one post after another, doing it all himself. Nor is the Service Product Officer an "expeditor" for the CO/ED.

It is also very important that the Service Product Officer advise seniors that he is going into their areas so as not to create a Danger condition and wind up having to run the entire org. He also does this by getting the seniors to handle their juniors so a product is gotten. He does not walk in and cross-order the seniors of areas but works with them to see that products are produced.

The Service Product Officer is one who comes up with BIG IDEAS on getting public flooded into the org and being serviced swiftly. He is the one who thinks along the line of PRODUCTS, PRODUCTS, PRODUCTS. By spanning the divisions, he coordinates the product wanted and ensures each division is aware of its part in getting this product and that their actions are uniform. Where the Service Product Officer spots diversity, or lack of uniformity, he must alert his org officer or HCO. By doing the actions of coordination for a product and product demand, the product officer creates a team and more importantly sets the pace of the org's production and morale.

ORG LINES AND THE SERVICE PRODUCT OFFICER

There are certain aspects of the organization which the Service Product Officer must be thoroughly trained in to do his job properly.

The Service Product Officer must be fully aware of all the Valuable Final Products (VFPs) of each department and each division of the org. Without this the Service Product Officer can create havoc, as he would be ordering Division 6 to recruit or the Reges to supervise. By not knowing cold the org VFPs, the Service Product Officer would certainly jam the flows throughout the org board.

A serious fault in any executive is not knowing the functions of terminals and the relation of one terminal to another. A key function of any executive is that of routing. An executive that misroutes communications and particles will tie his org in knots and wonder why no products are coming out. Therefore, a Service Product Officer must know cold every post function in the org and what particles belong on what lines.

He has got to know where a product comes from and where it goes in order to see it through the lines. A product officer's job is to name, want and get a product. However, he must first know where that product is to come from and where it is to go. This is an incredibly fundamental point.

In order for org lines to flow, routing forms (RFs) must be used. A routing form is a full step-by-step road map on which a particle travels. Every point a particle (which could be a student, a pc, mail, etc.) must go through to wind up at its destination must be listed on the routing form.

The Service Product Officer's Organizing Officer must ensure routing forms exist and are in use for each and every line in an org he deals in. Both he and the Service Product Officer must know these forms cold and be able to instantly spot when a line is being abused or ignored so as to slam in the correct routing.

A Service Product Officer must fully clay demo all the lines of an organization for each and every product. This must include each particle from entrance to the org and through all lines on which that particle would flow until it leaves the org. Lines are the most fundamental point of administration. To not have a full grasp of these lines would be detrimental to any product officer.

SERVICE PRODUCT OFFICER SEQUENCE OF ACTIONS

It is very easy for the Service Product Officer to become wrapped up in one area while neglecting the others; however, this must not be done as, while products might be getting through in one area, they may well be seriously bogging in others.

The Service Product Officer is concerned with promotion, sales, call-in, delivery and re-sign. He begins his product officering in promotion and gets products out there or started and moves on to sales and gets them on to getting their products and so on through call-in and delivery and re-sign. He then returns to the beginning, promotion, and follows up on what he started there and gets even more production out. This is basically how the Service Product Officer moves through the org.

Daily, the Service Product Officer must plan and battle plan out his day. He must list those products he intends to achieve in each one of his areas and then get them.

The Service Product Officer is not an "information courier" or "data gatherer." He is ahead of the game and *knows* the data. He must know what public haven't been regged in the org yet, he must know who hasn't been taken into session that day, or who has been stuck in Ethics for three days, and ensure these things get handled. Therefore he must be quicker and faster than anyone else in the org and run run run.

PROMOTION

Promotion is the first action of the SERVICE PRODUCT OFFICER. He must ensure the many promotional pieces and actions are getting done. Some of these are:

1. Selling of books.
2. Staff selling books.

3. Books placed in public bookstores.
4. Selling of books to FSMs, missions, distributors, retailers and salesmen.
5. Books sold on each public contact.
6. Books advertised in mags, ads, posters, fliers, etc.
7. ASR packs.
8. Info packs.
9. Div 6 handouts for lectures and free testing.
10. Posters on major services in Div 6.
11. Promo to field auditors, FSMs, Gung-ho Groups, Dianetic study groups.
12. Org mags.
13. Flag shooting boards.
14. Promo for future events and tours.
15. *The Auditor* (for SHs).
16. *Clear News*.
17. *Advance!* mag (for AOs).
18. *Source* mag (FSO).
19. I Want to Go Clear Club promo (AOs).
20. SHSBC/NED/internships/NOTs/grades, etc., specified in promo.
21. Promo at points of public inquiry.
22. Free testing ads.
23. Fliers inviting people to buy Scientology books.
24. More Info Cards used in books.
25. Ads in newspapers.
26. Questionnaires to detect people's plans for training and processing.
27. Enough letters to public so they come in.
28. All promotional actions per HCO PL 20 Nov. 65RB I, THE PROMOTIONAL ACTIONS OF AN ORGANIZATION.
29. Book seminars, public campaigns and lectures.
30. Public Reception display (books, posters, handouts, etc.).

31. Tours and events, Sunday service.

32. Free testing line.

33. Handling of Gung-ho Groups, keeping FSMs well supplied and supervision of Dianetic study groups and FSMs.

34. Test Centers outside the org as an extension.

35. Radio and TV advertisements.

36. Dept 17 services.

37. Reception greeting, handling, routing, chasing up people for appointments and handling incoming calls with ARC and efficiency.

38. Formation of Dianetic Counseling Groups.

39. Weekly tape and film plays.

40. Promotes the org and standard tech to Auditors Association.

41. Contacts and sees any sign of ARC broken field and alerts Chaplain to clean up the field.

The first thing a Service Product Officer would want to do is get out a large volume of promo to at least get some activity occurring. This would entail Dissem getting any promo laying around the org dug up and sent out to students and pcs. They would get it out in letters and mailings, they would get it handed out to students and pcs, they would pick up the half-completed promo piece, have it fixed up and sent out. They would have promo placed in Reception, in any public inquiry, etc. In other words, the Service Product Officer ensures that the org fully utilizes what promo they do have. He would also have specific promo pieces done to enlighten the field on what services the org has. Where any of this bogged he would push — debug — drive — name it — want it — and get it.

The Service Product Officer, in trying to get in any promotional items, must review what resources he has. For example, is there a Dir Clearing, is there a Receptionist, etc.? He must concentrate on getting those terminals that already exist busy on promotional actions that will create the largest volume of inflow, while his organizing officer works on getting more immediate resources to increase the volume even further. It would be senseless to have the Dir Clearing running around trying to form up groups in an inactive field, single-handing, when he has FSMs that need to be gotten on to selecting and driving in new public. The Service Product Officer is concerned with priorities of promotional actions, so must be totally aware of all the promotional items and actions that an org can produce.

Actions such as “improved org appearance,” “high ARC handling,” and “correct and efficient routing of public” can be put in instantly. If he has two people in all of Dissem he still can and must get the particles flowing and products coming off the line.

SALES

The sales lines consist of enlightening the public, having lines to sign people up, getting public into the org and signed up for service.

The following gives you an idea of some of the sales actions and lines in an org:

1. Body Reg phones and schedules public to come in for interview.
2. Use of CF to produce business.
3. Reges who accept advance registrations.
4. D of T procurement of students.
5. D of P procurement of pcs.
6. Receptionist sells to public coming in.
7. SHs in communication with the Class IV org Tech Secs and Registrars and targeting them for public completing and routing on to the higher org.
8. AO's and SH's case consultant actions.
9. AO/SH events to Class IV org Academies to encourage upper-level auditor training.
10. Use of FSMs, Auditors Associations, personal contact, etc., to get public into the org and on to their next service.
11. Fast lines so public are not left waiting to see the Reg.

The lines of routing a public person to the Reg, or from the Reg to a service, must be tight so public aren't lost and the Reg is continuously kept busy with the public. Therefore, the Service Product Officer must police these lines and where he notices any lack of uniformity he gets his org officer onto it. Nonuniform or slow routing interferes with the product, so the Service Product Officer gets it speeded up now by push — debug — drive — name it — want it — and get it.

The first actions of the Service Product Officer in the sales area are to get all "in-the-org" public routed to the Reg on breaks or after course end to be further signed up for additional service. He can also have Dissem drilling done with Reges so as to increase sales in the org. His operating procedure is products, products, products, now, now, now. His org officer or HCO and Qual can worry about organize, organize, organize.

CALL-IN

Call-in is the action of getting fully paids into the org on to their next service. This also includes getting partially paids fully paid and on to their next service. These functions are of great concern to the SERVICE PRODUCT OFFICER as undelivered services to the public can mess up a field and increase the chance of refunds. The Service Product Officer should see to it that the Call-in Units are given stiff targets and that their production is not monitored by low auditor hours or low-producing training

areas. The execution of needed programs to get Call-in Units fully operational is under the Service Product Officer per HCO PL 9 Aug. 79 I, CALL–IN: THE KEY TO DELIVERY AND FUTURE INCOME. This same policy also lists out the functions of the Call-in Units. Call-in falls between sales and delivery, as it deals with those either fully or partially paid and needing only to finish payment and be called in and gotten on to service.

DELIVERY

The Service Product Officer must ensure that the service lines of the org are fast and 100 percent standard, that pcs and students do complete quickly and don't get lost off the lines.

The Service Product Officer is to have an alert line with the public set up whereby if a student or pc's study or auditing is slowed, or if the public person is dissatisfied in any way, he can alert the Service Product Officer so it can be handled.

Some of the actions and lines to be product officered by the Service Product Officer are as follows:

1. Tech Services arranges housing, has the pc met when he is arriving and generally operates as the pc's host while in the org.

2. The many lines such as pc to Ethics, pc to Examiner, student to Ethics, student to Qual, C/S Series 25 line and pc to D of P line must be drilled so they are flawless and handled with ARC.

3. The most senior policy applied to this area is HCO PL 21 Nov. 68 I, SENIOR POLICY, "WE ALWAYS DELIVER WHAT WE PROMISE."

4. There must be an adequate amount of auditors, Tech Pages and FESers, Ds of P, Supervisors, Course Admins, etc.

5. The auditing line must be fast so no pcs wait to be serviced.

6. Use of all hands tech terminals in the org auditing when required to handle backlogged service.

7. Getting students through their courses and on to their internship at which point they can audit in the HGC.

8. Proper scheduling so every pc gets in 12½ hours a week minimum.

9. Recovering blown auditors, getting them fixed up and auditing.

The Service Product Officer ensures tech lines are fast. For instance, a pc's folder not getting C/Sed for days, or idle auditors and Ds of P "waiting" for pcs when they can be made to procure pcs, must be spotted and handled by the Service Product Officer.

The Service Product Officer must be kept briefed on what pcs and students arrive and how they are going to be handled. He must get around to these areas (Training and HGC) to ensure that there are no slows with public or anything that would get in the way of public receiving top-quality service.

Service to the public is the reason the org is there and service must be kept fast and 100 percent standard and plentiful. This is a primary duty of the Service Product Officer; he is there to ensure this occurs.

It is losses on service that keep public away, org income down and staff pay low.

RE–SIGN–UP

The re-sign-up line is also very key to an organization's prosperity. It brings further income, and proves conclusively that the last service received by the public person was of high quality. This is why the Service Product Officer must be very alert to the amount of re-signs. Some of the things that should be watched for are:

1. That the Reg is supplied with an upstat cert for his last completed service to present to the student or pc.

2. That the Reg knows fully how to handle the public person that won't re-sign (by sending them to Qual).

3. The Reg must be provided with tech estimates, Grade Chart information, etc., so he is aware ahead of time of what the student or pc's next action is.

4. Tech terminals are fully briefed and the line is in that every completion gets routed to the Reg. This must be drilled.

The public person should be serviced in your org until he/she requires upper-level service that your org cannot deliver, at which point they should be directed to the next higher org.

PITFALLS

The Service Product Officer can lose his effectiveness if he takes any "hey you" orders or gets stuck in at various points. He is not an expeditor. He is not an information and full-time coordinator terminal. He is an executive, a *product* officer, and he is there to ensure the entire machine runs.

He must be well versed on actions occurring in the org. He must also pay strict attention to completing actions he has started and to carrying a handling through to a done. Otherwise he can wrap himself around a pole with incomplete cycles which will ball up the line and prevent the service lines from flowing flawlessly.

Where the Service Product Officer post bogs it is undoubtedly due to a lack of an organizing officer, as with the speed in which a Service Product Officer demands products, he requires a fast-moving org officer. So it is essential this post be provided with an org officer as soon as possible.

INDEX

Those personnel in the org who are responsible for organization, any Esto personnel, etc., are the people who put the units in the org there. It is not the duty of a Service Product Officer to man and hat the org. Therefore, it is a lot of sweat off the Service Product Officer's brow to have a fully functioning Esto team backing up his actions in getting the flow of products out of the organization.

SUMMARY

The Service Product Officer ensures all the actions of getting public into, through and out of the org are *accomplished* with high quality results.

It is extremely important that this post be manned in each and every org. It doesn't just make the difference between a poor, empty org and a good org. This post makes the difference between a good org and a booming org.

PRODUCT OFFICERS

(Originally written by LRH for the *Apollo* OODs of 11 June 72.
Issued as an HCO PL on 21 Sept. 80.)

Worked last evening getting Tech to start shooting them through to completions.

The PL on Selling and Delivering Auditing (HCO PL 28 Sept. 71) tells why you have to audit a pc all at once, whole program. Dribbling it out means repairs due to life upsets before the guy made it.

So crowd it on and get a pc *through*. Then we'll have some products for our coins.

A product officer has to name, want and get his products.

This means one says, "You there. Joe Blow. Want him completed. All right get it DONE." Product by product. There is no general "Audit these pcs." "Get up the hours." Hell, you never get a product that way.

"You there, George Thunderbird. I want you through your Primary and onto and through course and classified. Get going, man, get going. Oh, you were told to weedle the toofle before you woofled by Dorance Doppler. Org Officer? Get that name — to Flag MAA, get the cross orders the hell off my lines. Now you George Thunderbird, I want you through your Primary and onto and through course by 1 July. You got it? You got it now! Good. Well, get with it. Get going!" Note on clipboard: Org Off to get cross order by Dorance Doppler invest and report. "There's your slip." Note on progress board. Geo Thunderbird HSDA 1 July. "Now you Tobler Tomias, what's the tale; how are you going? . . . Well, standing there smoking and looking at the scenery isn't going to do anything. If your girl doesn't like you anymore the thing to do is drown your sorrows in the Primary Rundown. . . . Okay, you are to be an Expanded Dianetics. All right, that's fine. I want you completed by 16 July. . . . I don't care if that's a 16-hour day. Let's see, Primary Rundown by _____ and Class IV Acad by _____ and _____. Yes, that's 16 July AT NOON. Man, to hell with your PTPs. Get going, man." And on the progress board. And from the board — "And here's Bill Coal. He should be off the Primary today, where is he? All right Bill — ah, you made it that far. Now you're on schedule. That's great. HSDA. Get with it, man. You completed Primary 20 minutes ago and aren't on the next course. Super! What the _____."

That's the way it goes for a Tech Prod Off. "We are finishing Agnes, Torp and Goshwiler today. Today. Yes today. Certified and off lines. Got it, D of T? Well, do it!"

Push, debug, drive. Name it, want it, get it.

That's the *only* way you ever get a product.

Sad but true.

They don't ever happen by themselves.

And all the public relations chatter in the world is not a product. I know this product officer beat.

It's a piece of cake.

But it has to be DONE.

When I wrote LRH ED 302 Int, DEBUG TECH BREAKTHROUGH, in February of this year, I promised that there would be a policy letter issued covering the tech more fully. Well, there have been further breakthroughs in the area of debugging production. The tech given in that LRH ED has been acclaimed by hundreds to be miraculous. This policy reissues that tech and brings it up-to-date with the new discoveries.

HISTORY

Recently I noticed quite a few programs were not progressing rapidly. I found many targets bugged. Project operators did not seem to know what to do and were getting losses and becoming frustrated. Their targets were "bugged."

"Bugged" is slang for snarled up or halted.

"Debug" means to get the snarls or stops out of something.

I had always been given to believe somebody had developed and written up debug tech. People would often tell me they had debugged this or that, so of course I assumed that the tech existed and that issues and checksheets existed and were in use. Yet here were people operating projects who couldn't get the targets done by themselves or others.

I didn't recall ever having written any policy letter containing the tech of debugging programs or targets.

So I called for the various "debug checksheets" and "debug issues" they were using and found something very astonishing. None had any real tech on them to debug something. They just had various quotes that did not necessarily apply.

I did a study of the subject based on what people trying to debug should be doing and what they were not doing and developed a fast, relatively simple system. Some project operators were located in very bugged areas which had brought them to apathy and even tears of frustration. The new debug tech was put into their hands and they came streaming back in wild excitement. It worked! Their areas were rolling!

I am releasing this tech to you as it is vital that programs are quickly executed and that production occurs.

This debug tech is tested, fully valid and for *immediate* use.

Debug tech is a vital executive tool. Anyone who is responsible for getting targets and programs executed, getting production out, turning insolvency into solvency and generally making a better world frankly can't live without it.

Debug tech is used to debug program targets, programs, a lack of completion of the cycles of action which lead to production and, in short, whenever there is *any* insufficiency of viable products coming from an area, org or individual.

THE TECH

I. *INSPECTION*

The first action in debugging an area is an inspection to see what is going on in terms of production. In inspecting the area you do the following:

1. You look for what products have been gotten out in the past.

2. You look for products that are there completed.

3. You look for what products can be attained in the immediate future.

4. You look for the value of the products produced as compared to the overall cost of the production organization.

5. You look for overt products or cycles where products continuously have to be redone, resulting in no or few products.

The full volume of data on how to do an investigation is given in the Investigations Checksheet of *The Volunteer Minister's Handbook.**

When you first inspect an area for products, you just look. Policies on "Look Don't Listen" apply (HCO PL 16 Mar. 72 I, LOOK DON'T LISTEN). Don't listen to how they are going to get 150 products; just look and walk around with a clipboard.

If you don't see 150 products waiting to be shipped or invoices showing they have been, they don't exist. If you don't see receipts for 150 shipped products, they don't exist and never have. The product is either there or there is ample shipping or departure or finance evidence that they have just left or been shipped. Products that are only in people's heads don't exist.

Dreams are nice — in fact they are essential in life — but they have to be materialized into the physical universe before they exist as *products*.

The most wide trap the debugger can fall into is "But next week . . . ," since experience will tell you that next week's production may never arrive. The definition of product is something that can be exchanged for a valuable product or currency. They have subproducts. These are necessary. A subproduct can also be an overt product and block final products.

When you have done your product inspection, you then look over the period of time from a viewpoint of time and motion. This is to answer the question "Are things arranged so that there is no time wasted in useless motions which are unnecessary?" This includes poor placement of materiel on a flow line or tool sheds five miles from the site of work so that one has to go there every time one wants a hammer, out-of-sequence flows or waits.

One counts up the amount of wasted time simply because of the disorganization of a place. It isn't enough to say a place is disorganized. How is this disorganization consuming time and motion which is not resulting in a higher quantity of production? Examples of this are quite gross.

When you have done this study, during which of course you have made notes, you will have the raw materials necessary to make an estimation of the area.

If there is not an adequate and even spectacular record of products getting out and if products have to be redone or if no products are coming out, you proceed as follows:

II. *PERSONAL HANDLING*

Find a product that *can* be gotten out, any product, and insist that it and products like it or similar cycles be gotten out flat out by the existing personnel.

*[*Editor's Note:* This data is now covered in *The Scientology Handbook* chapter on "Investigations."]

Do not let this debug act as an excuse for them not to produce. The first step of this handling *is* to demand production.

When you have gotten them on that, you enter in upon a second stage of debug. This consists essentially of finding if the place is knowledgeable enough and able enough to produce what is actually required and what is actually valuable or being needed from it.

This is accomplished as follows:

(Note: You should not attempt to find Crashing Mis-Us, etc., until the above inspection and the steps A to I below have been done.)

A. **WHERE ARE THE ORDERS RELATING TO THIS TARGET (OR PROJECT OR PRODUCTION AREA)?** (Can include policies, directives, orders, bulletins, issues, despatches, tapes, valid texts and previous debugs and any and all files.)

Handling: Collect up all of the orders relating to this target (or project or production area). This includes the orders and policies the person is operating off of as well as all those he should be operating off of. At this point you may need to employ the "How to Defeat Verbal Tech Checklist":

1. If it isn't written it isn't true.
2. If it's written, read it.
3. Did the person who wrote it have the authority or know-how to order it?
4. If you can't understand it, clarify it.
5. If you can't clarify it, clear the Mis-Us.
6. If the Mis-Us won't clear, query it.
7. Has it been altered from the original?
8. Get it validated as a correct, on-channel, on-policy, in-tech order.
9. IF IT CAN'T BE RUN THROUGH AS ABOVE *IT'S FALSE!* CANCEL IT! And use HCOB 7 Aug. 79, FALSE DATA STRIPPING, as needed.
10. Only if it holds up this far, force others to read it and follow it.

B. **HAVE YOU READ THE ORDERS?**

Handling: If he has not read them, then have him read, word clear and star-rate them.

Ca. **DO YOU HAVE MIS-Us ON THESE ORDERS?**

Handling: Get the orders word cleared using M4, M9 or M2 Word Clearing—whatever Word Clearing *is* needed to fully clear any Mis-Us he has.

Cb. **DO YOU HAVE FALSE DATA ON THESE ORDERS?**

Handling: Strip off the false data per HCOB/PL 7 Aug. 79, FALSE DATA STRIPPING.

Handle this step (Ca and Cb) until the person has duplicated the orders and issues relating to this production area.

D. **ARE THERE FINANCIAL OR LOGISTICS PROBLEMS ON THEM?**

Handling: Debug using HCO PL 14 Mar. 72 II, FOLLOW POLICY AND LINES, and Flag Divisional Directive of 25 Aug. 76, FINANCIAL PLANNING MEMBER HAT CHECKSHEET. Debugging this may require getting the whole FP Committee through the FP pack.

E. **ARE THERE PERSONNEL PROBLEMS?**

Handling: Debug this using HCO PL 16 Mar. 71 IV, LINES AND HATS, and the Personnel Series, as given in the *Management Series*.

It may be necessary to do this debug on the HAS or any person responsible for getting the products of staff members who produce.

F. **ARE THERE HATTING PROBLEMS?**

Handling: Handle this using full Word Clearing and False Data Stripping and get the scene debugged using HCO PL 29 July 71 I, WHY HATTING? and HCO PL 22 Sept. 70, HATS, and HCO PL 27 Dec. 70, HATS PROGRAM PITFALLS.

Hatting problems may include the total and utter lack of a hatting course for the staff or a hatting course where WHAT IS A COURSE? PL is flagrantly not in, and if you find this, you have gotten to the root of why you are working hard debugging all over the place and it had better be handled quick.

It may also be that the area senior doesn't make sure his staff puts in study time off production hours, and in this you may find the senior is a failed student himself and this you would also have to handle.

Note: A person who *cannot* be hatted at all has false data. The handling would be to strip off the false data.

G. **IS THERE EXTERIOR INFLUENCE STOPPING THE PRODUCTION WHICH CANNOT BE HANDLED IN THE PRODUCTION AREA?**

Handling: Handle using HCO PL 31 Jan. 72, THE WHY IS GOD, and HCO PL 25 May 73, SUPPLEMENTARY EVALUATIONS, and HCO PL 30 Dec. 70, ENVIRONMENTAL CONTROL.

When told that these exterior influences exist, the wise debugger immediately verifies. The simplest way to verify is to ask the person who is supposed to be putting stops on the line if he has issued such orders. You commonly find out he hasn't. But if he has, then you have started to locate your area to handle.

You commonly run into verbal tech at which moment you use the "How to Defeat Verbal Tech Checklist."

H. **WHAT OTHER EXCUSES EXIST?**

Handling: As per HCO PL 31 Jan. 72, THE WHY IS GOD; HCO PL 19 May 70, SANITY; HCO PL 30 Sept. 73 II, SITUATION FINDING; and HCOB 19 Aug. 67, THE SUPREME TEST.

And once any obvious ones in the above have been handled, and production *still* isn't rolling, you have:

I. **ROUTINE FINDING OF MIS-Us PER WORD CLEARING SERIES.**

J. **CRASHING MIS-U TECH PER HCOB 17 JUNE 79, CRASHING MIS-Us: THE KEY TO COMPLETED CYCLES OF ACTION AND PRODUCTS.**

Crashing Mis-U Finding is done exactly per this HCOB. Crashing Mis-Us can be buried or suppressed as covered in HCOB 23 Aug. 79 I, CRASHING MIS-Us, BLOCKS TO FINDING THEM. The factors as listed in that HCOB which can cause a Crashing Mis-U to remain hidden and unknown may have to be handled before the Crashing Mis-U appears.

K. **DO THEY HAVE ANY IDEA AT ALL THAT THEY SHOULD BE GETTING OUT ANY PRODUCTS? OR DO THEY PRETEND TO BUT DON T?**

Handling: Simply two-way comm on why the guy is there. It might come as a startling realization that he is supposed to get out products. This can be backed up with Exchange by Dynamics, HCO PL 4 Apr. 72 I, ETHICS, and Short Form Product Clearing, HCO PL 13 Mar. 72, PRODUCTION AND ESTABLISHMENT, ORDERS AND PRODUCTS, or HCO PL 23 Mar. 72, FULL PRODUCT CLEARING LONG FORM.

There is also such a thing as a person who will not complete a cycle of action. This is normally true of what we call a "suppressive person" or even an insane person.

Handling: Get the person's case looked into by a competent C/S and also by the Ethics Officer for background.

But as PTS people are in suppressive persons' valences, he may only be PTS.

Handling: See section P below for de-PTSing.

L. **WRONG STAT.** The person has been given a stat that has nothing to do with what he is supposed to produce.

Handling: Get the right stat figured out so that it agrees with what he is supposed to produce and actually measures his actual production.

M. **WRONG VFP OR WRONG PRODUCT? DO THEY HAVE THE IDEA OF VFP RIGHT?** (Or does the org think it's the award rather than the product, i.e., GI rather than an audited paying pc or a trained paying student?)

It of course can occur, amazingly, that the person or department, etc., is trying to turn out a product that has no exchange value. This can occur because what they do produce is so flubby as to be called "an overt product" which nobody can use further on up the line or even at the end of the line.

You handle this by coming down on their sense of fitness of things. Overt products waste resources and time and personnel and are actually more destructive than on first glance. They cannot be exchanged but they also waste resources as well as lose any expected return. You can remedy this sort of thing by improving their tech so they do turn out something decent and useful.

They can also be turning out a type of product nobody wants—such as 1819 buggy whips in a space age. They may be great buggy whips but they won't exchange because nobody wants them.

They may also be getting out products of excellent quality but never tell anybody they have or do them. This can apply as narrowly as one worker who doesn't tell anybody he is having or doing them or a whole organization which, with complete asininity, never markets or advertises their products.

It is also possible that a combination of all three things above may be found.

It also may be they have all sorts of products they could get out but they never dreamed of getting them out, yet their lifeblood may depend upon it.

Handling: HCO PL 24 July 78, SUBPRODUCTS, HOW TO COMPILE A SUBPRODUCT LIST, which tells how to compile a subproducts list and attain VFPs. Exchange by Dynamics per HCO PL 4 Apr. 72 I, ETHICS, and Full Product Clearing Long Form on the correct and actual VFP (as well as any other products the person or area may have), as well as marketing and PR tech.

N. **NEVER FIGURED OUT WHAT THEY WOULD HAVE TO DO TO GET A PRODUCT?**

Handling: Handle this using HCO PL 7 Aug. 76 I, II and III, AKH Series 33, PRODUCT–ORG OFFICER SYSTEM, NAME YOUR PRODUCT; AKH Series 34, PRODUCT–ORG OFFICER SYSTEM, WANT YOUR PRODUCT; AKH Series 35, PRODUCT–ORG OFFICER SYSTEM, TO GET YOU HAVE TO KNOW HOW TO ORGANIZE; HCO PL 24 July 78, SUBPRODUCTS, HOW TO COMPILE A SUBPRODUCT LIST; and HCO PL 14 Jan. 69 I, OT ORGS.

O. **OUT ETHICS?**

Handling: Determine the situation and handle with O/W write-ups or auditing and ethics conditions or correction of past conditions and the ethics policies that apply.

P. **IS THE AREA OR INDIVIDUAL CREATING PROBLEMS AND DEMANDING SOLUTIONS TO THEM?**

Handling: Give the person PTS handling as per ethics policies. If and when available, get the personnel de-PTSed using Clay Table De-PTSing as per HCOB 28 Aug. 79 I, PTS CLAY TABLE HANDLING, THEORY AND ADMINISTRATION. (Note: Clay Table De-PTSing can only be done on someone by a person who has had the step himself.)

Q. **TOTAL ORGANIZE? (IS THE AREA ORGANIZING ONLY?)**

Handling: This is an indicator of many misunderstoods in the area, especially on the part of its senior. The senior and the personnel in the area need full Word Clearing on the materials to do with the production area, including Crashing Mis-U Finding as in J (Ref: HCO PL 26 Mar. 79RB, MISUNDERSTOOD WORDS AND CYCLES OF ACTION) off production hours and meanwhile make them produce what they can.

R. **ORGANIZATION ADEQUATE TO GET THE PRODUCT? INADEQUATE ORGANIZATION?**

Handling: Debug the organization per HCO PL 13 Sept. 70 II, BASIC ORGANIZATION; HCO PL 14 Sept. 70 I, COPE AND ORGANIZE; HCO PL 14 Sept. 70 II, HOW TO ORGANIZE AN ORG; HCO PL 8 Oct. 70, ORGANIZING AND PRODUCT; HCO PL 29 Oct. 70 I, THE ANALYSIS OF ORGANIZATION BY PRODUCT.

NO ORGANIZATION?

Handling: This is the situation where someone does not organize any corner of his area or work or organizations or lines. This manifests itself by irrational demands to only produce and to prevent any organization so that production can occur. The handling is to clear the misunderstoods (including Crashing Mis-Us) in the area, particularly on the purpose of the production and why one is producing.

LACKING A SENSE OF ORGANIZATION?

Handling: Lack of a sense of organization lies below the level of Mis-Us, overts and withholds and PTSness — and you have to go north through PTSness and overts and withholds to even get to the Mis-Us.

The handling would be de-PTSing as in step P. Then handle any overts and withholds and then clear the Mis-Us in the area being addressed (including Crashing Mis-Us).

Debug tech is laid out as a checklist in HCO PL 23 Aug. 79R II, DEBUG TECH CHECKLIST. It is a very useful checklist, as the points of debug can be assessed on a meter by an auditor (or any person trained to use an E-Meter) or be administratively used by anyone wishing to debug an area.

HCOB 23 Aug. 79R II, PRODUCT DEBUG REPAIR LIST, is for use by an auditor to repair someone who has been messed up by somebody trying to debug his area. As faulty debugging can mess a person up, this repair list has been written to remedy that, should it occur.

Normally, in an area that is very bogged and not producing, the first question or two will deliver the reasons right into your hands. They are trying to produce blue

ruddy rods but the order they finally dig up after a fifteen-minute search says specifically and directly that green finglebums are what are wanted here and that blue ruddy rods are forbidden. It is usually outrageous and large. As you go down the list, you will find out that you are running into things which open the door to justification. So you take very good care to notice the justifications which are being used. The handling of justifications is indicated in HCOB 23 Aug. 79 I, CRASHING MIS-Us, BLOCKS TO FINDING THEM, and HCOB 21 Jan. 60 I, JUSTIFICATION.

WHAT TO HANDLE

Handling of course is indicated by what you find and the above references. But handling must always be in the direction of at least 50 percent production. Even while debugging, do not go for an all-organize handling. Also do not go for an all-production handling.

A person, once trained on the data as contained in this PL, Crashing Mis-U tech, False Data Stripping and Product Clearing, will be able to get almost any area debugged and producing. It is important to remember that debug tech applies from the very small expected action to the huge expected project.

THE EP OF DEBUG

The above debug actions are never carried on past the point where the target or area or individual or org has been debugged.

Once production has been debugged and desirable products are now being gotten for real in adequate quantity, the debug has been accomplished.

This could occur at any one of the above steps. And when it does, you let the area get on with producing the products they are now able to produce.

EVALUATION AND PROGRAMING

There is a whole different technology called evaluation. The full tech on how to evaluate and program is contained in the Data Series and the Data Series Evaluator's Course and the Target Series HCO PLs: 14 Jan. 69 I, OT ORGS; 16 Jan. 69, TARGETS, TYPES OF; 18 Jan. 69 II, PLANNING AND TARGETS; 24 Jan. 69 I, TARGET TYPES; 24 Jan. 69 II, PURPOSE AND TARGETS; and HCO PL 14 Dec. 73, TARGET TROUBLES. One is expected to know how to evaluate. But even after you have evaluated, evaluations contain targets. And targets get bugged. So you will need debug tech even when you are an accomplished evaluator.

With the debug tech and the added steps of Crashing Mis-U Finding, overts and withholds, False Data Stripping, Product Clearing, etc., you will be able to crack the back of the most resistive nonproducing areas and get them into roaring, high-morale production.

Between February 79 and 23 August 79, I have spent a great deal of development time on the technology needed to completely debug people, projects, targets and production. A very large number of missions, researches and pilots were undertaken to discover and polish up this tech. It can now be considered a completed development cycle.

The above IS the tech.

USE IT!

REMIMEO

ESTABLISHMENT OFFICER SERIES 38-1

STOPPING PRODUCTION LINES

(Originally issued 4 Oct. 79 as LRH Executive Training Instructions.)

I just figured out how some secretly ill-intentioned persons could go about totally stopping a production line. They could pretend to be busy and doing something while actually creating chaos and overt products and pretending to reform and reassuring people it was all going along, and so involve the actual producers in the area in complexities and problems to a point where nothing could be completed.

This would come from an extremity of PTSness or secret revenge, but it could be developed into a system which would effectually stop production without seeming to.

The clue that this might be going on is the consistent use of orders and policy to stop and pretended false data. It's a kind of a trap they would get one into.

DEBUG TECH CHECKLIST

Refs:

HCO PL	23 Aug. 79R I Rev. 23.8.84	Esto Series 38 Product Debug Series 1 DEBUG TECH
HCOB	23 Aug. 79R II Rev. 14.6.88	Product Debug Series 10 PRODUCT DEBUG REPAIR LIST
The Product Debug Series		

(This checklist is clarified by HCO PL 23 Aug. 79R I, DEBUG TECH, and is used in conjunction with that PL.)

Production is the basis of morale. People who don't get products have low morale.

Executives and responsible people have the task of getting out products. When they don't get them out, the unit or organization fails.

It is extremely upsetting and puzzling to a staff member and to his seniors when he can't get out the products expected of him. I have seen an executive going around in circles for weeks trying to guess why such and such a staff member couldn't get out the products of his post area. I have seen staff members actually in tears because they were unable to achieve the products of their post. I have also seen people busy, busy, busy and totally unaware of the fact that they were producing absolutely nothing.

LRH ED 302 was a breakthrough. It has now been written into HCO PL 23 Aug. 79R I, DEBUG TECH, and contains a considerably expanded tech on how to debug products. People have had very great success in applying it.

To give them even greater successes, I have rewritten LRH ED 302-1 into this PL. The whole object of this checklist is to debug a lack of products and accomplishments of an org or post.

USE OF THIS CHECKLIST

This Debug Checklist is used in conjunction with HCO PL 23 Aug. 79R I, DEBUG TECH. It gives the person doing the debug a list of things that could be standing in the way of production. The sequence of handling is as laid out in the Debug Tech PL. The first action is an inspection of the area. Then come the personal handling steps.

This sequence must be followed in any debug action. For instance, if you haven't done the inspection, then how would you know what it is you are trying to debug?

This checklist can be assessed on a meter or be administratively used (off the meter) by Mission Operators, Program Operators, Project Operators, Evaluators, executives and anyone else needing to debug a cycle of action or lack of products, including any staff member or student himself. The only restriction on the administrative use of the list is that Sections O (out-ethics and O/Ws), P (PTS) and S (drugs) must be turned over to a qualified auditor who checks them using an E-Meter. They are *not* checked without using a meter. This is to ensure that reads and withholds don't get missed on these sections.

When assessed on a meter, each reading line is taken to F/N by doing the handling given for that line. In many cases the full handling of a reading line will involve steps done off the meter or in another session. Where this is the case, the person being debugged is put back on the meter when all the handling steps for that question are done, to ensure that he is F/Ning and VGIs and satisfied that that point is now handled.

Though the checklist is often done with the use of a meter, its purpose is not to sort out a person's *case* considerations or difficulties. Some of its questions and handlings involve case-handling actions such as rudiments and PTS handlings, but the purpose of the list is to get stalled production *un*stalled and production occurring.

When doing this checklist the individual should have the issues and references he may need to carry out the handlings along with him. He must also have a copy of HCO PL 23 Aug. 79R I, DEBUG TECH, with him for ready reference.

Anyone using this checklist must be checked out and drilled on it and on HCO PL 23 Aug. 79R I, DEBUG TECH.

THE EP OF DEBUG

Debug actions are never carried on past the point where the target or area or individual or org has been debugged.

Once production has been debugged and desirable products are now being gotten *for real in adequate quantity,* the debug has been accomplished.

This could occur at any one of the steps. And when it does, you let the area get on with producing the products they are now able to produce. But don't neglect to keep an eye on the area to make certain it is actually and stably debugged, and don't drop any incomplete action (such as PTS handling or False Purpose RD) because production is now occurring.

PRODUCT DEBUG REPAIR LIST

In case of a bog or trouble on the following checklist use HCOB 23 Aug. 79R II, PRODUCT DEBUG REPAIR LIST, to repair the person so he can continue with the debug actions.

INSPECTION

00. The first action in debugging an area is an inspection to see what is going on in terms of production.

THIS ACTION IS *ALWAYS* DONE AS THE FIRST STEP IN ANY DEBUG. IT IS NOT OMITTED OR SKIMPED OR BRUSHED OFF.

In inspecting the area you do the following, making notes on what you find and checking off each step as it is completed:

___ 1. You look for what products have been gotten out in the past.

___ 2. You look for products that are there completed.

___ 3. You look for what products can be attained in the immediate future.

___ 4. You look for the value of the products produced as compared to the overall cost of the production organization.

___ 5. You look for overt products or cycles where products continuously have to be redone, resulting in no or few products.

Full data on how to do this inspection is given in HCO PL 23 Aug. 79R I, DEBUG TECH.

0. Find a product that *can* be gotten out, any product, and insist that it and products like it or similar cycles be gotten out flat out by the existing personnel.

THE CHECKLIST

Section A:

A1. **NO ORDERS?** _____

(Find out if [a] he's needing orders due to not knowing his hat, [b] he's not getting any direction or guidance from his senior or [c] if he never received the orders. Handle [a] by getting him hatted or [b] by doing this checklist on his senior or [c] by having him get the orders and handle any cut line that isn't relaying the orders.)

A2. **CROSS ORDERS?** _____

(Find out what and handle per HCO PL 13 Jan. 79, ORDERS, ILLEGAL AND CROSS.)

A3. **ILLEGAL ORDERS?** _____

(Find out what and handle per HCO PL 13 Jan. 79, ORDERS, ILLEGAL AND CROSS.)

A4. **VERBAL TECH?** _____

(Find out what and handle per the "How to Defeat Verbal Tech Checklist" in HCO PL 23 Aug. 79R I, DEBUG TECH, and with False Data Stripping.)

Section B:

B1. **HASN T READ THE ORDERS?** _____

(Have him read, word clear and star-rate the orders.)

B2. **AVOIDANCE OR NEGATION OF POLICY?** _____

(Get his O/Ws off per HCOB/PL 2 Mar. 84R, O/W WRITE–UPS, or with Sec Checking. Then clear up his Mis-Us on the relevant policy.)

B3. **POLICY UNKNOWN?** _____

(Determine what applicable policy is unknown to him and have him read, word clear and star-rate it.)

B4. **LACK OF TECH?** _____

(Have him get familiar with the exact problem he's encountering and make him work out a solution that will handle it.)

B5. **NEVER LOOKED OVER AND READ UP ON THE EXACT MATERIALS YOU ARE SUPPOSED TO BE USING IN THIS PROJECT OR ACTION?** _____

(Have him read and word clear the exact materials he needs to know to get out the products.)

B6. **NEVER MEMORIZED THE BASIC STABLE DATA AND LAWS OF THE AREA?** _____

(Have him dig up and memorize the stable data and laws of his field or area. Note that this applies to admin and other type personnel quite in addition to technical people.)

Section C:

C1. **MISUNDERSTOODS?** _____

(Find and clear the Mis-Us.)

C2. **MISUNDERSTOODS ON THE ORDERS?** _____

(Find and clear the Mis-Us.)

C3. **DOESN T UNDERSTAND THE ORDERS?** _____

(Handle with Word Clearing and False Data Stripping.)

C4. **FALSE DATA ON THE ORDERS?** _____

(Handle with False Data Stripping.)

C5. **OUT OF AGREEMENT WITH THE ORDERS?** _____

(Get any out-ruds handled. Then handle with Word Clearing and False Data Stripping. If needed, get C/S okay and do a Disagreement Check per HCOB 22 Mar. 72RA, DISAGREEMENT CHECK.)

C6. **NO INTEREST?** _____

(Find out if it's out-ruds or Mis-Us or past failures and handle accordingly.)

C7. **LACK OF VALUE OF THE CYCLE OF ACTION ITSELF?** _____

(Find his Mis-Us and handle. Have him demo out the cycle of action.)

Section D:

D1. **FINANCE BUGS?** _____

(Find out what the bug is and get it debugged by using this checklist and finance policy on it. If it amounts to that, get the whole FP Committee through the FP pack.)

D2. **LOGISTICS PROBLEMS?** _____

(Find out what it is and handle with HCO PL 14 Mar. 72 II, FOLLOW POLICY AND LINES, and any other debug tech needed.)

D3. **ARE YOU MISSING ANY EQUIPMENT?** _____

(Find out what is needed and if it *is* really needed; if so debug it per D1 and D2 above so it is gotten. Remember that there are enormous percentages of people who absolutely have to have before they can possibly do and use that usually as an excuse not to produce.)

Section E:

E1. **SCARCITY OF PERSONNEL?** _____

(Indicate it. Then investigate and handle HCO, which is usually up to its ears in personnel requests and busy on them instead of putting an HCO there that properly recruits, hats and utilizes personnel. This may mean doing this Debug Checklist on the HAS or any person responsible for that division or activity because they aren't getting the products of staff members who produce.)

E2. **SOME OTHER PROBLEM WITH PERSONNEL?** _____

(Debug this using HCO PL 16 Mar. 71 IV, LINES AND HATS, and the Personnel Series, Org Series and Esto Series.)

Section F:

F1. **ABSENCE OF HATTING?** _____

(Find out if it's [a] lack of a hatting course for the staff, [b] a hatting course where What Is a Course? PL is flagrantly not in, [c] the area's senior doesn't make sure his staff put in study time off production hours or [d] some other reason why the person does not go to study. Handle according to what comes up and HCO PL 23 Aug. 79R I, DEBUG TECH.)

F2. **DOESN T ATTEND STUDY?** _____

(Find out if it's [a] lack of a hatting course for the staff, [b] a hatting course where What Is a Course? PL is flagrantly not in, [c] the area's senior doesn't make sure his staff put in study time off production hours or [d] some other reason why the person does not go to study. Handle according to what comes up and HCO PL 23 Aug. 79R I, DEBUG TECH.)

F3. **ABSENCE OF DRILLING?** _____

(Get any needed drilling on equipment and actions done.)

F4. **ABSENCE OF CRAMMING?** _____

(Get the subject cramming is needed on and send him to Cramming.)

F5. **FAULTY CRAMMING?** _____

(Get what occurred. If it doesn't clean up immediately, then send the data in to the C/S, who will program for handling, e.g., with a Cramming Repair List.)

F6. **A DISASSOCIATION BETWEEN THE THEORY OF WHAT IS SUPPOSED TO BE DONE AND THE PHYSICAL UNIVERSE?** _____

(Get the specific area of disassociation and have him demonstrate — in clay if necessary — and give real examples of the application of the theory. Program for the Hubbard Key to Life Course and Super Power.)

F7. **FALSE DATA ON THE HATTING MATERIALS?** _____

(Handle with False Data Stripping.)

F8. **LACK OF TECHNICAL KNOW HO W?** _____

(Locate the area of technical know-how he is lacking in and get him studying and drilling the tech on it.)

F9. **UNABLE TO BE HATTED?** _____

(Strip off the false data in the area with False Data Stripping. If this does not fully handle, send the person's folder to the C/S for programing; the program can include Student Rehabilitation List, Study Green Form, False Purpose RD, etc., as applicable.)

Section G:

G1. **EXTERIOR INFLUENCE STOPPING THE PRODUCTION WHICH CANNOT BE HANDLED IN THE PRODUCTION AREA?** _____

(Handle per Section G of HCO PL 23 Aug. 79R I, DEBUG TECH.)

Section H:

H1. **OTHER EVENTS OR REASONS?** _____

(Find out what and handle per HCO PL 23 Aug. 79R I, DEBUG TECH.)

H2. **HUGE PRODUCTION BUG?** _____

(Find out what and use full debug tech to handle.)

H3. **TIME?** _____

(Find out if there's just NOT ENOUGH time to do what he has to do or if he's wasting time by not being organized or is being dev-ted. Handle with HCO PL 14 Feb. 80, ORDER VERSUS DISORDER, study and application of dev-t PLs, etc., as applicable.)

H4. **TROUBLE WITH COMM LINES?** _____

(Find out what the trouble is. It could include W/Hs, Mis-Us, unfamiliarity with the comm lines, an incomplete or omitted Non-Existence Formula, an absence of functioning comm lines. Handle what is found as applicable per ethics policies, Word Clearing tech and the Org and Esto Series.)

H5. **INABILITY TO COMMUNICATE?** _____

(Pull his W/Hs. Make him do Reach and Withdraw on the people and objects of his area. Program him for a TRs course and the Hubbard Key to Life Course.)

H6. **ABSENCE OF ALTITUDE?** _____

(Have him read HCO PL 4 Oct. 68 II, ETHICS PRESENCE, and Exec Series 1 and 2. Have him demo how he can use them and then drill their use.)

Section I:

I1. **MISUNDERSTOODS OR CONFUSIONS IN THE PRODUCTION AREA?** _____

(Routine Word Clearing per the Word Clearing Series.)

I2. **MISUNDERSTOODS OR CONFUSIONS ON WHAT IS SUPPOSED TO BE DONE?** _____

(Routine Word Clearing per the Word Clearing Series.)

Section J:

J1. **CRASHING MISUNDERSTOOD?** _____

(Crashing Mis-U Finding per HCOB 17 June 79, CRASHING MIS-Us: THE KEY TO COMPLETED CYCLES OF ACTION AND PRODUCTS.)

J2. **TROUBLE COMPLETING CYCLES OF ACTION IN THE PRODUCTION AREA?** _____

(Crashing Mis-U Finding per HCOB 17 June 79, CRASHING MIS-Us: THE KEY TO COMPLETED CYCLES OF ACTION AND PRODUCTS.)

Section K:

K1. **NO IDEA AT ALL THAT PRODUCTS SHOULD BE GOTTEN OUT?** _____

(Simply two-way comm on why the guy is there. It might come as a startling realization that he is supposed to get out any products. This can be backed up by Exchange by Dynamics per HCO PL 4 Apr. 72 I, ETHICS, and Product Clearing per HCO PL 13 Mar. 72, PRODUCTION AND ESTABLISHMENT, ORDERS AND PRODUCTS, or HCO PL 23 Mar. 72, FULL PRODUCT CLEARING LONG FORM.)

K2. **PRETENDING TO KNOW THAT PRODUCTS SHOULD BE GOTTEN OUT BUT DOESN T GET THEM OUT?** _____

(Simply two-way comm on why the guy is there. It might come as a startling realization that he is supposed to get out any products. This can be backed up by Exchange by Dynamics per HCO PL 4 Apr. 72 I, ETHICS, and Product Clearing per HCO PL 13 Mar. 72, PRODUCTION AND ESTABLISHMENT, ORDERS AND PRODUCTS, or HCO PL 23 Mar. 72, FULL PRODUCT CLEARING LONG FORM.)

K3. **WON T COMPLETE A CYCLE OF ACTION?** _____

(Get the person's case looked into by a competent C/S and an Ethics Officer for background. If you are dealing with a suppressive or insane person, handle per ethics policies. If it is PTSness, get the person de-PTSed; if it is pretended PTSness as per HCOB/PL 28 Feb. 84, PRETENDED PTS, get the person programed for the False Purpose RD.)

Section L:

L1. **WRONG STAT?** _____

(Get the right stat figured out per policy on stats and stat management so that it agrees with what he is supposed to produce and actually measures his actual production.)

L2. **DOES THE STAT HAVE NOTHING TO DO WITH WHAT IS SUPPOSED TO BE BEING PRODUCED?** _____

(Get the right stat figured out per policy on stats and stat management so that it agrees with what he is supposed to produce and actually measures his actual production.)

Section M:

M1. **WRONG VFP?** _____

(Use HCO PL 24 July 78, SUBPRODUCTS, HOW TO COMPILE A SUBPRODUCT LIST, Exchange by Dynamics and full Product Clearing Long Form on the correct and actual VFP — as well as any other products the person or area might have.)

M2. **WRONG PRODUCT?** _____

(Use HCO PL 24 July 78, SUBPRODUCTS, HOW TO COMPILE A SUBPRODUCT LIST, Exchange by Dynamics and full Product Clearing Long Form on the correct and actual VFP — as well as any other products the person or area might have.)

M3. **UNSURE OF WHAT THE PRODUCT IS?** _____

(Get a complete and accurate statement of the correct product and product clear him on it. See also HCO PL 7 Aug. 76 I, PRODUCT–ORG OFFICER SYSTEM, NAME YOUR PRODUCT.)

M4. **THINKING IT S THE AWARD RATHER THAN THE PRODUCT?** _____

(Use HCO PL 24 July 78, SUBPRODUCTS, HOW TO COMPILE A SUBPRODUCT LIST, Exchange by Dynamics and full Product Clearing Long Form on the correct and actual VFP — as well as any other products the person or area might have.)

M5. **OVERT PRODUCTS?** _____

(Handle any W/Hs connected with this. Then handle per HCO PL 23 Aug. 79R I, DEBUG TECH, Section M.)

M6. **NO MARKETING OR ADVERTISING OF THE PRODUCT?** _____

(Handle any W/Hs connected with this. Then handle per HCO PL 23 Aug. 79R I, DEBUG TECH, Section M.)

Section N:

N1. **NEVER FIGURED OUT WHAT WOULD HAVE TO BE DONE TO GET A PRODUCT?** _____

(Handle per HCO PL 23 Aug. 79R I, DEBUG TECH, Section N.)

Section O:

Note: Section O is to be done only by a qualified auditor using an E-Meter. It is not to be done off the meter.

Each question in Section O must be prefaced so that the questions are limited to the person's current post, position or the immediate cycle that is being debugged (e.g., "Concerning the production of ruddy rods, _____," "As dishwasher, _____" or "On the target to plant potatoes, _____," etc.).

O1. **OUT ETHICS?** _____

(Handle as a W/H, E/S to F/N. Then get the person sorted out by application of ethics conditions, Sec Checking, etc., as applicable per ethics policies. May require repair of past ethics conditions per HCO PL 19 Dec. 82R II, REPAIRING PAST ETHICS CONDITIONS.)

O2. **ACTIVE COUNTER INTENTION?** _____

(Handle as a W/H, E/S to F/N. Locate and clear the person's Mis-Us in the area of the counter-intention. C/S to program for False Purpose RD. In any case, watch him and remove him if he remains CI.

If it is CI on the part of others, then find out who and handle any agreement he has with their CI as a W/H, E/S to F/N. Get the person or persons who have CI handled on their O/Ws and get their Mis-Us found. C/S to program them for False Purpose RD. In any case, watch them and remove if they remain CI.)

O3. **OTHER INTENTIONEDNESS?** _____

(Handle the other-intentionedness as in O2.)

O4. **ARE YOU WITHHOLDING SOMETHING FROM ME?** _____

(Pull it, E/S to F/N.)

O5. **HAVE YOU DONE THINGS YOU COULD BE HIT FOR?** _____

(Handle as a W/H, E/S to F/N.)

O6. **ARE YOU BEING CRITICAL OF OR MALICIOUS ABOUT OTHERS?** _____

(Pull all overts and withholds connected with this, each E/S to F/N. Note for handling of any black PR campaign he may be running on others. C/S to program for the False Purpose RD if applicable.)

O7. **HAVE YOU LISTENED TO CRITICAL OR MALICIOUS STATEMENTS ABOUT OTHERS?** _____

(Pull all overts and withholds he has connected with this, each E/S to F/N. False data strip the area of the critical or malicious statements to EP. Note for investigation and handling of any black PR campaign that may be occurring. C/S to program for the False Purpose RD if applicable.)

O8. **IS THIS NOT A POST OF YOUR OWN CHOOSING?** _____

(Handle the dishonesty of accepting a post with no intention of doing it and go E/S on times he's done that, to F/N. C/S to program for Sec Checking and/or False Purpose RD, as applicable.)

O9. **DO YOU KNOWINGLY DO THINGS THAT CAUSE OVERT PRODUCTS?** _____

(Get what he has done specifically and handle each thing done as a W/H, E/S to F/N. C/S to program for False Purpose RD.)

O10. **WHEN PRODUCTS ARE NOT COMING OUT RIGHT, DO YOU NOT CROSS CHECK TO MAKE SURE YOU LOCATE ALL THE ERRORS?** _____

(Handle as a W/H, E/S to F/N.)

O11. **HAS ANY EQUIPMENT BEEN REMOVED OFF THE LINES?** _____

(Get the data. Handle any overts and withholds connected with it, E/S to F/N.)

O12. **HAVE YOU DAMAGED ANY EQUIPMENT?** _____

(Handle as a W/H, E/S to F/N.)

Section P:

Note: Section P is to be done only by a qualified auditor, using an E-Meter. It is not to be done off the meter.

P1. **LOTS OF UNSOLVABLE PROBLEMS IN THE AREA?** _____

(Get the data, noting all meter reads and route it to the C/S. The person will need PTS handling per ethics policies. Other personnel in the area must also be checked for PTSness and handled as found necessary.)

P2. **CONNECTED TO SOMEONE OR SOMETHING ANTAGONISTIC?** _____

(Get the data, noting all meter reads and route it to the C/S. The person will need PTS handling per ethics policies.)

P3. **PTS?** _____

(Get the data, noting all meter reads and route it to the C/S. The person will need PTS handling per ethics policies.)

NAVIGATE
FIRST PAGE
SEARCH
FIND
AGAIN
EXIT
CONTENTS
ORG BOARDS
INDEX

P4. **ACCIDENTS?** _____

(Get the data, noting all meter reads and route it to the C/S. The person will need PTS handling per ethics policies.)

P5. **ROLLER COASTERING?** _____

(Get the data, noting all meter reads and route it to the C/S. The person will need PTS handling per ethics policies.)

Section Q:

Q1. **ORGANIZING ONLY?** _____

(Handle his Mis-Us in the area, including any Crashing Mis-Us.)

Q2. **TOTAL ORGANIZATION?** _____

(Handle his Mis-Us in the area, including any Crashing Mis-Us.)

Section R:

R1. **IS THE AREA DISORGANIZED?** _____

(If this is the case, do the inspection and handling steps of HCO PL 14 Feb. 80, ORDER VERSUS DISORDER. Also get done any needed study, Word Clearing, Crashing Mis-U Finding, etc., as per Section R of HCO PL 23 Aug. 79R I, DEBUG TECH, so that the area is understood and gotten organized and productive.)

R2. **IS A LOT OF TIME SPENT TRYING TO FIND THINGS?** _____

(Handle as in R1.)

R3. **ARE THINGS NOT FILED BUT JUST PILED AROUND THE AREA?** _____

(Handle as in R1.)

R4. **IS THERE NO SYSTEM OF LOCATING THINGS?** _____

(Handle as in R1.)

R5. **ARE THINGS NOT LOGGED IN AND OUT WHEN THEY ARE USED?** _____

(Handle as in R1.)

R6. **DOESN T UNDERSTAND THE THINGS BEING USED WELL ENOUGH TO ORGANIZE THEM?** _____

(Handle as in R1.)

R7. **PUZZLED ABOUT HOW TO ORGANIZE THE AREA?** _____

(Handle as in R1.)

R8. **LACKING A SENSE OF ORGANIZATION?** _____

(Get the person through PTS handling per ethics policies. Next handle any overts and withholds on the area with Sec Checking, then clear the Mis-Us and Crashing Mis-Us in the area being addressed.)

R9. **NO GRASP OF THE CONCEPT OF ORGANIZATION?** _____

(Handle as in R8.)

Section S:

Note: Section S is to be done only by a qualified auditor, using an E-Meter. It is not to be done off the meter.

S1. **HAVE YOU EVER TAKEN DRUGS, MEDICINE OR ALCOHOL?** _____

(Let him tell you about it, noting any reads. Get the data to the C/S so that he can be programed for full drug handling and/or FES and repair of past drug handlings.)

S2. **ARE THERE PEOPLE IN THE PRODUCTION AREA WITH UNHANDLED DRUGS?** _____

(Get the data and how he feels this may be affecting production in the area. Any unhandled drug cases must be gotten through the Purification RD and full drug handling.)

ORDER VERSUS DISORDER

Refs:

HCO PL	9 Feb. 74R	CONDITION BELOW TREASON
	Rev. 17.2.80	CONFUSION FORMULA AND EXPANDED CONFUSION FORMULA
HCO PL	30 Dec. 70	Personnel Series 15 Org Series 20 ENVIRONMENTAL CONTROL

I made a breakthrough recently, while investigating low production areas, and realized that a good deal more needs to be said on the subject of order and disorder.

Order is defined as a condition in which everything is in its proper place and performs its proper function. A person with a personal sense of order knows *what* the things in his area are, he knows *where* they are, he knows *what* they are for. He understands their value and relationship to the whole.

A personal sense of order is essential in getting out products in an area.

An orderly typist, for instance, would have all the materials requiring typing, she would have ample paper and carbons within arm's reach, she would have her correction fluid to hand, etc. With all preparatory actions done, she would sit down to type with an operational typewriter and would know what that typewriter was and what it was for.

She would be able to sit down and get her product, with no wasted motion or stops.

But let's say you had a carpenter who couldn't find his hammer and he didn't even know what a hammer was for and he couldn't find his chisel because when he picked it up he put it down and couldn't find it again and then he didn't know where his nails were. You give him a supply of lumber and he doesn't know what it's for, so he doesn't categorize it where he can put his hands on it.

How many houses do you think he would build?

The actual fact of the case is that a disordered person, operating in a disorganized area, makes a ten-minute cycle into a three-week cycle (believe it, this is true) simply because he couldn't find his ruler, lost his eraser, broke his typewriter, dropped a nut and couldn't find it again and had to send off to Seattle for another one, etc., etc., etc.

In working with a group of nonproductive technicians recently, I discovered something interesting: out-basics. I actually found a lower undercut to what we generally think of when we say "basics."

These technicians had reportedly researched a key piece of equipment and had it all sorted out. But I found that they didn't even know the basic fundamental of what that machine was supposed to do and what they were supposed to be doing in their area!

That told me at once that they had no orderly files, no research data. They were losing things.

Now, if they were losing things, that opened the door to another basic: They couldn't have known where things were. They put down a tool over there and then when they needed it again they would have to look all over the place because they hadn't put it down where it belonged.

Their work was not organized so that it could be done and the tools were not known.

So I checked this out. Were they logging the things they were using in and out so they could find them again? Were they putting things away when they were done with them? No, they weren't.

This is simply the basic admin coupled with the knowledge of what the things one is working with are. It's orderliness and knowing what things are, knowing what they are for and where they are, etc. That's the undercut.

If people don't have a true knowledge of what the things they're working with are, if there are omitted tools, inoperational tools, if they don't know what their tools are supposed to do, if there are no files or if once used, files are not reassembled and put back in the file drawer, if things get lost and people don't know where things are and so on, they will be running around spending 3 or 4 hours trying to locate a piece of paper. That isn't production.

If a person can't tell you what the things he works with are, what they're for and where they are, he isn't going to get out any product. He doesn't know what he's doing.

It's like the carpenter trying to build a house without knowing what he's got to build it with, without understanding his tools and raw materials and the basic actions he must take to get his product. That's what was holding up production in the area: disorderliness. And the basics were out.

This is actually far *below* knowing the tech of the area — the actual techniques used to get the product. The person does not even know what his tools and equipment are or what they're supposed to do. He doesn't know whether they are operational or inoperational. He doesn't know that when you use a tool you return it to its proper place. When you have a despatch, you put it in a file where it can be retrieved. It undercuts even knowing the orders and PLs relevant to his hat.

What are the basics that are missing? The basics of sitting down to the table that one is supposed to sit down to, to do the work! The basics of knowing what the tools, materials and equipment he works with *are* and what he's supposed to do with them to get his product. Those are the basics that are missing.

We are down to a real reason why a person cannot turn out products.

That is what is holding up such a person's production. It is well below knowing the technique of his job.

Out-basics. Does the guy know where the file is? When he finishes with that file does he leave it scattered all over the place or does he put it back together and into the file where it can be found?

Now, a person who's working will have papers all over the place, but does he know where they are and is he then going to reassemble them and put them back in order or is he going to just leave them there and pile some more papers on top of them?

If you find Project No. 2 scattered on top of Project No. 1, you know something about that area. Basics are out.

This is a little piece of tech and with that piece of tech you've got insight. You would have to have an overall picture of what the area would look like when properly ordered and organized — how it would be organized to get optimum production.

Then you could inspect the area and spot what's going on. You would inspect on the basis of: How does the area compare with how it should be organized? You would find out if the personnel didn't know what the things in their area were or what they were for, you would see if they knew the value of things in the area or if there were altered importances, omitted files or filing, actions being done out of sequence, inoperational tools or equipment, anything added to the scene that was inapplicable to production, etc.

In other words, you can inspect an area by outpoints against this one factor of orderliness.

This sort of out-basics and disorderliness cuts production down to nothing. There just won't be any production at all. There will be no houses built.

What we are talking about here is an orderly frame of mind. A person with a sense of order and an understanding of what he is doing sits down to write a story or a report and he'll have his paper to hand, he'll have it fixed up with carbons and he'll have his reference notes to hand. And before he touches the typewriter he'll familiarize himself with what the scene is. He'll do the necessary preparatory work in order to get his product.

Now, someone else might sit down, write something, then dimly remember there was a note someplace and then look for an hour to find where that note was and then not be able to find it and then decide that it's not important anyway and then come back and forth a few times and finally find out he's typed it all up without a carbon.

There is a handling for this. Anyone trying to handle an area who doesn't understand the basics of what they're dealing with and is in an utter state of disorder must get a firm reality on the fact that until the basics are learned and the disorder handled, the area will not produce satisfactorily.

The following inspection is used in determining and handling the state of such an area.

INSPECTION

This inspection is done in order to determine an area's knowledge of basics and its orderliness. It can be done by an area's senior for the purpose of locating and correcting disordered areas. It is also used as part of debug tech as covered in HCO PL 23 Aug. 79 I, Esto Series 38, Product Debug Series 1, DEBUG TECH. It is for use by anyone who is in the business of production and getting products.

The full inspection below would be done, clipboard in hand, with full notes made and *then* handlings would be worked out based on what was found in the inspection (according to the Handling section of this PL and the suggested handlings given in parentheses below).

1. **DOES HE KNOW WHAT ORGANIZATION, FIRM OR COMPANY HE S IN? DOES HE KNOW WHAT HIS POST OR JOB IS?**

   This is a matter of does he even know where he is? Does he know what the organization or company he works for is, does he know what the post he is holding is?

   (If he is so confused and disoriented that he doesn't even know the company or org he's in or doesn't know what his post is, he needs to apply the Expanded Confusion Formula, HCO PL 9 Feb. 74R, and then work up through the conditions.

   Of course the person would also need to be instant-hatted on his post — the organization, his post title, his relative position on the org board, what he's supposed to produce on his post, etc.

   If he is doing this handling as part of his Expanded Confusion Formula, simply have him get the instant hatting and carry on with his Confusion Formula.)

2. **ASK THE PERSON WHAT HIS PRODUCT IS.**

   Does he know? Can he tell you without comm lag or confusion?

   You may find out that he has no idea of what his product is or that he has a wrong product or that he has confusions about his product. Maybe he doesn't even know he's supposed to get out products.

   (If this is the case, he must find out what his product is. If the person's product is given in policy references, he should look these up. If his product is not covered in tech or policy references, he'll have to work out what it is.)

3. **CAN HE RATTLE OFF A LIST OF THE BASIC ACTIONS, IN PROPER SEQUENCE, NECESSARY TO GET OUT HIS PRODUCT OR DOES HE HEM AND HAW ON IT?**

   Does he know what to do with his product once it is completed?

   He may try to tell you what he does each day or how he handles this or that and what troubles he's having with his post. You note this, but what you're interested in is does he know the basic actions he has to take to get out his product? And does he know what to do with the product once it is complete?

   (If he can't rattle off the sequence of actions 1, 2, 3, then he'd better clay demo the basic actions, in proper sequence, necessary to get out his product and then drill these actions until he can rattle them off in his sleep. If he does not know what to do with his product once completed, then he'd need to find out and then drill handling the completed product.)

4. **ASK HIM WHAT HIS TOOLS ARE THAT ENABLE HIM TO GET THIS PRODUCT.**

   Note his reaction. Can he name his tools at all? Does he include the significant tools of his area? Does he include his hat pack as a tool?

   (If he doesn't know what his tools are, he'd better find out what he's operating with and what it does. A good workman knows his tools so well he can use them blindfolded, standing on his head and with one arm tied behind his back.)

5. **ASK HIM TO SHOW YOU HIS TOOLS.**

   Are his tools present in the work area or does he have them out of reach, down the hall or in some other room?

   (He may have to reorganize his work space to get his tools within easy reach and to get in some basics of organization. The purpose of such organization would be to make production easier and faster.)

6. **ASK HIM TO TELL YOU WHAT EACH OF HIS TOOLS ARE.**

   Can he define them?

   Does he know what each of them are and what they are for?

   (If he doesn't know, he'd better find out.)

7. **ASK HIM TO TELL YOU WHAT THE RELATIONSHIP IS BETWEEN EACH ONE OF HIS TOOLS AND HIS PRODUCT.**

   (If he can't do this, have him clay demo the steps he takes to get out his products with each tool he uses, so he sees the relationship between each tool and his product.)

8. **ASK HIM TO NAME OFF THE RAW MATERIALS HE WORKS WITH. ASK HIM TO SHOW YOU HIS MATERIALS.**

   Does he know what his raw materials are? Are they in his work area? Are they in order? Does he know where to get them?

(He may have to find out what the raw materials of his post are [by defining them] and where they come from. He should drill procuring and handling them and then run Reach and Withdraw on them.)

9. **DOES HE HAVE A FILE CABINET? FILES? ASK HIM WHAT THEY ARE.**

   Does he know what they are for? Does he know what a despatch is, etc.?

   (He may have to be brought to an understanding of what files, file cabinets, despatches, etc., *are* and what they have to do with him and his product. He may have to clay demo the relationship between these things. He will have to set up a filing system. Ref: HCO PL 18 Mar. 72, Esto Series 10, FILES.)

10. **DOES HE HAVE A SYSTEM FOR LOCATING THINGS?**

    Ask to see it. Check his files. Does he have logs? Does he log things out and correct the logs when he puts them back? Are the comm baskets labeled? Does he have a specific place for supplies? Ask him to find something in his files. How long does it take?

    Does he have an orderly collection of references or a library containing the materials of his field? Is it organized so as to be usable?

    (If he has no system for locating things, have him set one up. Have him establish a filing system, a logging system, label the comm baskets, arrange supplies, etc. Get a reference library set up and organized. Drill using the system he has.)

11. **WHEN HE USES AN ITEM, DOES HE PUT IT BACK IN THE SAME PLACE? DOES HE PUT IT BACK WHERE OTHERS CAN FIND IT?**

    He'll probably tell you, yes, of course he does. Look around. Are objects and files lying about? Is the place neat or is it a mess? Ask him to find you something. Does he know right where it is, or does he have to search around? Is there an accumulation of unhandled particles around?

    (Have him clay demo why it might be advantageous to put things back in the same place he found them. Drill him on putting things back when he's finished with them. Have him clean up the place, handling any accumulation of unhandled particles.)

12. **IF FEASIBLE, ACTUALLY GO WITH THE PERSON TO HIS PERSONAL LIVING AREA.**

    Is the bed made? Is the area clean? Are things put away? How much dirty laundry does he have? Is it stowed in a bag or hamper or is it strewn about the place? People who had disorderly personal MEST, one for one were *not* getting out any products on post — they had no sense of order.

    (If his personal quarters are a mess, have him — on his own time of course — straighten up his personal area and keep it that way on a daily basis. This will teach him what order *is*.)

Some areas, of course, will be found to be in excellent order and will pass the inspection. These will most likely be high production areas.

Other areas will be found to have only a few points out which would correct easily with the above handlings. These will probably be areas where some production is occurring.

Where personnel have a concept of what order is and why it is important, they will usually be eager to correct the points of disorder that have turned up on the investigation and may need no further urging, drilling or correction, but will quickly set about remedying outpoints. For many bright and willing staff members just reading this policy will be enough to get them to straighten out their areas right away.

There is, however, a sector which has no concept of order and may not have the slightest notion of why anyone would bother with it. You will most likely find them in apathy, overwhelm or despair with regard to their post areas. No matter what they do they simply cannot get their products out in adequate quantity and quality. They try and try and try but everything seems to be working against them.

When you find such a situation, know that the area is in Confusion. You are trying to handle an area which is in a confirmed, dedicated condition of Confusion.

Such an area or individual would require the application of the Expanded Confusion Formula (HCO PL 9 Feb. 74R) including the handlings above. So if these things confirm in an area, you must use the Expanded Confusion Formula and the handlings given above to full completion. Because, frankly, such an area or individual *is* in a condition of Confusion and will remain in Confusion until the Expanded Confusion Formula, including the full handlings from the inspection, are applied.

Once out of Confusion the person would have to be brought up through the rest of the conditions.

CAUTION

The condition of Confusion is a very low condition and should never be assigned where it is not warranted. Where one or two points on the above inspection were found to be out in an area, and where these corrected easily, there would be no purpose in assigning Confusion to that area. In fact, it may worsen an area to assign an incorrect condition.

But where you have a long-term situation of no or few products combined with a state of disorder, know that the area or individual is in a condition of Confusion and that the application of the Confusion Formula plus the handlings given in this PL will bring the area out of the muck and up to square one where it can *begin* producing.

NOTE: If the inspection is done on a person or area and some of the points are found to be out and handlings are done but no condition of Confusion is assigned, the area must be reinspected about a week later. This way you will detect if an actual condition of Confusion was missed, as the area will have lapsed back into disorderliness or will have worsened.

SUMMARY

A knowledge of the basics of an area and having orderliness in an area are essential to production.

When you find a fellow who is a light-year away from the basics and doesn't have a clue on the subject of order and he's flying way up in the sky someplace instead of just trying to put together what he's supposed to put together or do what he's supposed to do, you've got your finger on his Why for no production.

With the inspection and handlings given in this policy, we can now handle any degree of disorderliness and disorganization.

And order will reign.

Nonproductive areas become capable of producing.

Already producing areas increase their production.

And production will roll.

ESTABLISHMENT OFFICER SERIES 41

POST PURPOSE CLEARING REVIVED

(Originally issued as an HCO Bulletin of same date, same title.)

Ref: HCOB 4 Aug. 71R POST PURPOSE CLEARING
Rev. 26.11.74

Recently some new technology, known as Deoppression, was developed for and is being used on orgs. (Deop is part of mission tech and is the subject of Flag Orders.)

There is a piece of good technology that has fallen out of use: It is Post Purpose Clearing. It is quite successful in raising the general tone level and production of orgs. All by itself it produces an increase in production.

It should be undertaken, for sure, after a Deoppression of an org is done. And, factually, it should be done in any case.

The tech of it is contained in the reference HCOB. But to that HCOB could be added additional steps.

PPC 12A. One asks, "What is your intention toward your post?" One takes this to F/N.

PPC 12B. One asks, "What is your post product?" One takes this to F/N.

PPC 12C is done, "What is your intention in getting out that product?" To F/N.

PPC 12D. "What volume of product do you intend to get out?" To F/N.

PPC 12E. "What degree of quality do you intend your products to have?" To F/N.

PPC 13 and PPC 14 are as given in the reference HCOB.

There is an added note to Post Purpose Clearing. It probably accidentally got swept aside when some Quals abused What, How and Why in questions and got org staff snarled up because these were listing questions. Qual was arbitrarily forbidden to use such listing questions and this may have influenced this action of Post Purpose Clearing, so necessary to orgs, and the tech got lost. The result has been, in some cases, confused and unproductive staffs.

Also, some seniors, not knowing how their own departments or divisions were supposed to run, tended to knock off hats and put people on posts doing the wrong things, resulting in a "hey you" org board.

The remedies for these two errors are quite plain.

1. When any step results in a BD F/N result, indicate it to the pc. In case of any bog, treat the two-way comm pc statements as though they were L&N items. Any bog can be repaired with an L4B.

2. In the case of executives and seniors, clear them on the various posts over which they have command, using the OEC Volumes for reference. This will tend to make them hold the form of the org.

Various outnesses will be found by any Qual attempting to do this on an org. They may discover, for instance, that the org has no hats: But this should not stop them, although it should be remedied fast as well.

By adding the intention step, Qual is certainly going to collide with a few rock slams regarding products or the org. But this is all to the good: we don't want rock slammers messing up products or the org. Any plants or people of evil intentions will show up, though PPC is not intended as an ethics cycle.

PPC is an organizing step and should not be used to stop production. But, at the same time, it should not be forbidden because it is an organizing step.

The speed with which a PPC can be done is not forever. At PPC 2, if the person is set up to have one as in this step, the PPC should, for most posts, simply sail along like a June breeze. With a VGIs at the end.

QUAL'S OBJECT IN GETTING THIS DONE ON A STAFF AND NEW STAFF MEMBERS IS TO IMPROVE THE QUALITY OF PRODUCTION OF THE ORG AND TO INCREASE THE PRODUCTION OF THE ORG.

It is quite true that the pay of the org depends upon the individual quality and volume productivity of each individual org member. A PPC well done throughout an org inevitably should raise, by making a better org, org income and pay.

Remember that orgs which have had the highest stats were those orgs which ran closest to OEC policy. This is an historical fact, borne out time after time. So in all Post Purpose Clearing, your main reference is green-on-white, the policy letters, and these should be handy and referred to in any case where the duties of the staff member are unclear.

It will also come about that you are handling someone who holds two or three posts. In that case, clear all of them but add a step PPC 12F, "Is there any conflict with your other hats and posts?" If it reads, "What are the conflicts?" and "How are you going to resolve that?"

All cautions and directions in the reference HCOB apply in doing any Post Purpose Clearing.

REMIMEO

ESTABLISHMENT OFFICER SERIES 42

POST PURPOSE CLEARING FOR MANAGEMENT TEAMS AND EXECUTIVES

(Originally issued as an HCO Bulletin of same date, same title.)

Refs:

HCO PL	17 Dec. 81	Esto Series 41 POST PURPOSE CLEARING REVIVED
HCOB	4 Aug. 71R Rev. 26.11.74	POST PURPOSE CLEARING

The two necessary ideas a management team or executive must have:

1. That a long-term view, as well as immediate remedies, is vital.

2. That an increase in stats and betterment of organization health is desirable.

Management staff members or executives who do not have these concepts or intentions have no business on a management team or on post as these two basics are why they are there.

A member of management or an exec can always shortsightedly operate for a quick profit (i.e., get lots of service sold but none delivered; buy a cheap machine that will look good on an FP but will break down in a month; do a fast, bad job to get up stats and then involve others for months trying to handle the botch; falsely reassure seniors that all is well when, in a short time, a crash will expose them; operate on short-term stats and ignore the gradual drift down over the months).

When only short-term views are taken, disaster is being courted.

A betterment of the organization and its prosperity has to be intended by management or an executive in order to bring it about. When a management team or an executive has other-intentioned items at work, they harm or destroy not only the organization but also themselves (i.e., not have to work so hard; be powerful personally; get even with others; have more time for the family; keep up with my golf; live better; wear better clothes; escape the Ethics Officer; and, of course, simply intending to do the place and staff in).

Upper-echelon intentions bring about the state of the division, org or network not only in the present but in the future. If they *intend* to make things go right, they will, of course, observe their area and study successful policies and actions of proven worth and apply them.

The state of stats, long term, of an executive or management team gives a definite revelation of their real intentions.

SUMMARY

Where any management team or executive is failing, it will be found that their view is very short term and they are other-intentioned on post.

In management and executive Post Purpose Clearing, one has to keep these two things in view.

A good manager or executive works hard hour by hour to keep the show on the road but always with a long-term view as well. And he intends that org and staff will prosper.

The auditor in Post Purpose Clearing will get a lot of glib answers. The stats, the honest ones, and the true long-term performance of the executive, measured by the health of his zone of responsibility, tell the tale and should be consulted when in doubt.

The Post Purpose Clearing auditor must be sure these two principles above are really the case and, if not, handle the executive so that they are.

PERSONNEL SERIES 30
ESTABLISHMENT OFFICER SERIES 43

PERSONNEL POLICY

We are building strongly for the future.

Scientology is going to go on for a VERY long time.

The way to build a strong future is to build a strong organization.

Internally, the only way we have been held back is by out-ethics and nonproduction. This does not build a strong organization or a strong future.

Therefore, we have no room on staffs for those who do not produce — or worse, are extravagant and produce overt products — or (which goes with poor production) are out-ethics.

We need productive people who keep their ethics in.

Individuals, and above all execs, are the building blocks of organizations.

To build strongly for the future, keep the above points in mind where appointing, promoting or handling personnel.

Personnel of that caliber belong outside orgs — they are the pcs and cases. Do not recruit them, appoint them or leave them on post when found.

One can mend people. But one cannot build a new world with broken straws.

It takes the ethical few to handle the many. And these are what our orgs must be built with now. The strong within only then can handle the weak outside.

Make it easy in the future for all of us. We have a long way to go. The speed we get there is measured by the ethical quality of persons on exec posts and on staffs. It is fine to be big brother to all the world — so long as we keep our staffs the top people. Be them.

HCO PL	10 Mar. 71R I Rev. 27.10.82	Finance Series 5 FBO HAT
HCO PL	27 July 82R Rev. 20.9.82	Finance Series 25 DEPUTY FBOs FOR MARKETING OF ORG RESOURCES FOR EXCHANGE (D/FBO FOR MORE)
HCO PL	3 Sept. 82	Finance Series 27 DEPUTY FBO FOR MARKETING OF ORG RESOURCES FOR EXCHANGE (D/FBO FOR MORE) PURPOSE

(NOTE: The pilot for this post has been long and successful: it is the FCCI PO [Flag Case, Course, Internship Product Officer] whose duties were covered by the famous Bulldozer EDs issued on Flag. However, the FCCI PO also covers the post of what is now called D/FBO for MORE [D/FBO for Marketing of Org Resources for Exchange]. Without this post effectively manned, the FSO — Flag Service Org — collapses and any sag in its stats is instantly traced to the nonfunctioning of the FCCI PO post. The post once functioned well in the Office of the Staff Captain and has functioned less well in the Office of the CO FSO. Therefore, the D/CO [or D/ED] for Delivery and Exchange post is put in close liaison with the strong and powerful International Finance Office Network, while remaining under the authority of the CO or ED of the org.)

The Service Product Officer in any org should have D/CO or D/ED status.

His key function is to see that the org operates at the highest level of exchange. (Ref: HCO PL 10 Sept. 82, Finance Series 28, EXCHANGE, ORG INCOME AND STAFF PAY)

Therefore, his post is now retitled D/CO (or D/ED) for Delivery and Exchange and he is located in the Office of the CO/ED, Department 19, of all Class IV and Sea Org orgs.

He is the bridge between the D/FBO for MORE and the FBO.

This creates a flow:

You have the D/FBO whipping up business by seeing that the public is made aware of the org's products and services, and driving more business down on the org than it can waste.

The D/CO (or D/ED) for Delivery and Exchange makes sure this public gets SIGNED UP and SERVICED. He is a product officer who names, wants and gets promotion, sales, call-in, delivery itself and re-sign occurring.

The FBO, then, sees to the org's solvency by ensuring income is greater than outgo, that production is properly financed, that staff are well paid for their production and that Flag is recompensed for good management of the org. And all of this makes it possible for the org to then expand and deliver in greater volume.

The flow goes from public (D/FBO) to ⟶ the whole sign-up and service line (D/CO or D/ED for Delivery and Exchange) to ⟶ solvency and volume (FBO).

It is this incredibly workable lineup that takes an org stably up the conditions of exchange. (Ref: HCO PL 10 Sept. 82, Finance Series 28, EXCHANGE, ORG INCOME AND STAFF PAY)

But the line breaks down where there is no D/CO or D/ED for Delivery and Exchange posted. And where it breaks down most specifically and ruinously is in the area of CALL–IN.

If one wants call-in to occur and the org's exchange with its public kept in, the only way to do it and also expand the org is to get a D/CO or D/ED for Delivery and Exchange on post and functioning.

Public interest may be kindled, public reach may be occurring, public may be paying partially or in full for goods or services, but if goods and services aren't being delivered in full the flow is broken and the org is in a condition of only partial exchange. Delivery in full means calling in the person so the service CAN be delivered. In this way the org maintains "fair exchange" with each and every public on its lines.

So the answer for any org that is sitting in a condition of only partial exchange, or an org that is ANYWHERE below the fourth condition of exchange — exchange in abundance — is to immediately, at once and yesterday, and without ripping off some vital post, post a D/CO or D/ED for Delivery and Exchange.

The first and primary function of the D/CO (or D/ED) for Delivery and Exchange is CALL–IN and this means he personally gets call-in done all by his little lonesome. With his own hands and voice he himself begins to call in fully and partially paids. Call-in is his first duty and when he's got that going he posts a Call-in Officer to take over the hat which he has already begun and he then expands onto the other functions of his D/CO or D/ED for Delivery and Exchange post, as covered in HCO PL 9 Aug. 79R II,

SERVICE PRODUCT OFFICER. But he FIRST and PERSONALLY and BY HIMSELF gets call-in going and exchange occurring at once.

What is involved here is the administrative principle that in order to get something done that is an expanding function you give it to somebody and tell him to expand it.

A CO or ED, whose responsibility it is to see that the main functions of the org are getting done, also wears the planning and coordination hat for the whole of the org's activity. If he's going to get the show on the road he needs to delegate some of this responsibility. He needs a deputy — the Deputy CO (or D/ED) for Delivery and Exchange — and that deputy needs the authority and the clout to see that, through promotion, sales, call-in, delivery and re-sign, the main products of the org do get produced.

Getting this post filled competently enables the ED to fully wear his planning and coordination hat and makes it possible for the flow from D/FBO to D/CO (or D/ED) for Delivery and Exchange to FBO to occur.

As some orgs in recent times have experienced both external and internal suppression on the subject of calling people in and servicing them, the D/CO (or D/ED) for Delivery and Exchange is given the additional powers of immediate communication to the International Finance Office and the Inspector General Network without vias to report and get help to remedy internal and external situations in orgs which suppressively inhibit call-in, delivery or expansion whether by inattention, refusals to post vital posts, failures or refusals to contact or call in interested persons, theft of org prospects or business or outright rip-offs to the end of ensuring successful execution of his duties and the expansion of the org. A form for such a report will be provided but absence of a form or a supply of such forms must not inhibit such reports.

This IS the winning combination by which an org moves up to "fair exchange" with all of its public and from there up to the highest level of exchange.

And it is the highest level of exchange toward which the whole activity of the D/CO or D/ED for Delivery and Exchange is geared — exchange in abundance!

THE TOOLS OF MANAGEMENT

Refs:

HCO PL	11 Apr. 70 I	THIRD DYNAMIC TECH
HCO PL	28 July 72	Exec Series 16 Org Series 32 Esto Series 26 ESTABLISHING, HOLDING THE FORM OF THE ORG
HCO PL	1 July 82	AKH Series 41 MANAGEMENT COORDINATION

There is a simplicity to managing effectively. It begins with the basics of management.

Although it may appear so to some, successful management is not a highly complicated, esoteric activity. But, just as an auditor or a C/S must know and be able to use the exact tools of first dynamic tech in handling cases in order to achieve exact and standard results on a one-for-one basis, so must an executive or manager know and be able to use the exact tools of third dynamic tech in handling groups to achieve successful and exact results in every instance.

Within the wealth of data on third dynamic tech contained in HCO Policy Letters, the OEC Volumes and recorded LRH lectures and books on the subject, there are certain definite, specific *tools* a manager uses. These are the tools of management.

The difference between brilliant management and mediocre or no management, at any level, lies in:

1. Knowing what the *tools* of management are, and

2. Knowing how to use them.

Many people are not aware that, like a carpenter or any other workman, a manager uses specific and exact *tools*. Thus, we see people here and there who are doing the equivalent of using the handle of a chisel to drive nails into wet concrete.

It is a common fault with inexpert workmen to find them using their tools wrongly or not using them at all. They make a breakthrough when they discover what the specific tools are for.

One can see this in people who can't mix sound or can't become mixing engineers. They sit with all these knobs in front of them, reach out and grab this knob or that one, hoping hopefully something will happen to the sound. Yet every component they have in front of them is an exact tool to do an exact thing with sound!

There are a lot of comparisons one could make, but the point is that people in management positions have precise *tools* available to them in Dianetics and Scientology which happen to be far better tools than have ever been available on the planet.

One can have very good people on management posts who still can drown if they don't know and put to use the management tools.

But without these being specified as exact tools, one might not see the simplicity of it.

MANAGEMENT ECHELONS

Operating as it does into an expanding scene, Scientology has grown into the need for and use of various echelons of management.

In orgs, for some time we have had division heads and above them we have the Executive Council, headed by the CO or ED of the org.

Above the level of service orgs we have middle management and still above that we have the Senior Executive Strata of management. And each of these echelons must know the tools of management and how to use them.

The OEC (Org Executive Course) and the FEBC (Flag Executive Briefing Course) have long been established as the essential courses for training executives at service org level and above.

These courses, and the OEC and Management Series Volumes upon which they are based, teach the form of the org and how to use the parts and posts and functions that go to make up the whole. They give us executives who know how to correctly utilize staff and their assigned posts and duties. We call it "knowing how to play the piano" — it's a matter of knowing what key to hit when and which keys to use in combination to produce a desired result. (Ref: HCO PL 28 July 72, ESTABLISHING, HOLDING THE FORM OF THE ORG) In other words, it's a matter of knowing and using one's tools. The OEC and FEBC courses teach this data and much, much more.

While at this writing there are numerous OEC and FEBC grads and more in the making, thousands more will be needed to handle the current rate of expansion.

Meanwhile an executive at any level and whatever his training needs to know and use his management tools NOW if he is to function at all.

A div head must "know how to play the piano" within his division.

The posts of CO or ED, Chief Officer, Supercargo, Org Exec Sec and HCO Exec Sec require executives who are capable of "playing the piano" across the divisions of the entire org and using hats and posts and functions correctly in order to achieve immediate production from the org as a whole.

At middle management one is handling not one function nor only one org but many orgs and their functions, which requires "knowing how to play the piano" at that level.

And at the Senior Executive Strata of management, we get into the vital need for "knowing how to play the piano" across a much wider sphere, using the full scope of management tools and using them with high skill. One might be using the same tools as lower stratas of management but a higher level of expertise is required as one's planning, decisions and actions are influencing far, far broader areas.

What has brought this about is the rapid expansion of Scientology into wider zones of responsibility and therefore increased responsibility with a resultant increase in traffic. This naturally has to be handled by increasing efficiency. What it has done, in effect, is push some up from lower-level management status to upper-level management status, necessarily. Without realizing it, some executives have been climbing a status stairs in terms of influence and zones of control. And they can go only so high without being terribly precise in their use of tools. After that, without this acquired precision, they drown.

The obvious answer to all of this is an executive training program which instant-hats executives on the fundamental tools of management and provides Management Status checksheets through which an executive or manager raises his status by *becoming more and more expert with these and an even wider range of tools*. And such a program has now been developed!

MANAGEMENT STATUS CHECKSHEETS

The new executive training program consists of three status levels.

These levels are to be covered in a series of Management Status checksheets.

The Management Status One checksheet has a prerequisite of Staff Status II. It *instant-hats* an exec on the basic tools of management, such as:

The Admin Scale, target policy, strategic plans, programs, specific lines and org terminals, org boards, despatches and telexes, statistics and graphs, conditions, hats and hatting, files, personnel folders, ethics folders, etc. Each one is a specific tool.

The Management Status Two checksheet (with an OEC prerequisite) consists of a profound review of the basic management tools and study of the upper-level tools of management, which include:

Surveys, PR, pilots, review of past performance, general economics, finance systems, cost accounting, control through networks, admin indicators, morale, legal, goodwill, exchange, missions (Action missions), economical management and managing by dynamics.

The Management Status Three checksheet (with FEBC prerequisite) would be a more profound review of the basic *and* upper-level management tools, in addition to training on the twelve ingredients of expansion upon which the Senior Executive Strata operates.

Even an OEC or FEBC grad would do the Management Status checksheets as, when he comes out of an OEC or FEBC, all in the clouds, the Management Status checksheet is needed to bring him back down to earth and tell him he's dealing with tools which are very finite tools.

What is being communicated to executives by these checksheets is that they have tools, what the tools are exactly, and that they must use them.

EXECUTIVE STATUS LEVELS

There are specific requirements to be met by a manager to attain each of the three Executive Status levels.

Working up through these status levels, a manager not only becomes more proficient in handling an org, any org, but becomes fully certified to operate at middle or senior echelons of management.

The Executive Status levels are:

1. EXECUTIVE STATUS ONE: At this level, the person is simply thrown on post, the basic management tools are put into his hands via a brief, rat-a-tat-tat Management Status One checksheet and he gets on with it.

2. EXECUTIVE STATUS TWO: For one to be certified at this level, one must have completed the OEC, done the Management Status Two checksheet and have an adequate production record.

3. EXECUTIVE STATUS THREE: For one to be certified at this level, he must have completed the FEBC, done the Management Status Three checksheet and have a proven production record.

When the steps for Executive Status certification are complete, the exec must present adequate evidence of such to the Qualifications Division. After verification of the evidence, he is awarded the appropriate Executive Status certificate.

By use of these Executive Status levels, executives at management levels could see what executives they had (or not had). The designation "ES I" (Executive Status I) would tell them at once what they were dealing with, etc. Also, from the viewpoint of the individual, he would know where he had to go to get an upper-level rating.

Once these Management Status checksheets are issued, middle and central management personnel should not draw full pay or be bonus eligible until they have completed the Management Status One checksheet, as they will not be operating effectively until they have done this.

EXECUTIVE STATUSES AND STAFF STATUSES

The Exec Status levels do not replace Staff Status training. All staff and execs are programed and move up the Staff Statuses so as to have a better idea of the org as an org; these levels are also indicative of the training and experience of a staff member and show his promotion eligibility.

An executive should attain Executive Status One by completing the Management Status One checksheet as soon as possible upon assuming post, so he has the management tools available for his immediate application.

Once an exec attains Staff Status VI (Org Exec Course graduate), he can attain Executive Status Two by fulfillment of the requirements listed above. An FEBC graduate achieves Executive Status Three in a similar fashion.

SUMMARY

With the release of the new Management Status checksheets, precise and gradient training levels for all echelons of management will exist comparable to the precise and gradient training levels required for all echelons of technical delivery.

Quite an unbeatable combination!

One winds up with managers fully familiar with their exact tools, having the one-two-three of management tech at their fingertips, and "knowing how to play the piano" effectively across an org, a continent, a planet!

So the answer to current expansion is an action which is geared to bring about even further expansion. And that is the only way to go!

It begins with the basic tools of management.

YOUR POST AND LIFE

A vital datum has emerged in my recent whole track research.

IF ONE KNOWS THE TECH OF HOW TO DO SOMETHING AND CAN DO IT, AND USES IT, HE *CANNOT* BE THE ADVERSE EFFECT OF IT.

This applies in many, many ways and is in fact a key point of life — a fundamental that may underlie all others.

And it applies to you directly on a post and in life.

If you know the tech — and that includes policy — of your post and apply it, you cannot be the adverse effect of it. FACT!

This has many ramifications:

1. A hatted staff member is not only at cause over his post, he is safe.

2. A well-trained auditor gets no adverse reaction from auditing others.

3. A well-trained Supervisor has no adverse reaction from students.

4. A fully trained and functioning staff can get no real adverse reaction from superiors or even an enemy.

5. An SP confronted by someone who knows and can use all the tech concerning SPs would shatter.

The list could go on and on since the datum pervades all sectors of life itself. In fact, it is almost mystical!

There is a corollary: If one is experiencing an adverse effect on a post or in life, then he does not know or has not applied the tech or policy covering it.

There is also a limiting factor: The full benefit of the datum is not sweepingly realized in all sectors until one is all the way up the Bridge. *BUT* the datum is so powerful that it can be applied and will manifest itself even in small things like opening cans, much less doing a post.

And knowing that one datum can save you enormous trouble and grief and put you on the road to OT doing what you're doing and right where you are!

Nice, eh?

BASIC MANAGEMENT TOOLS

Refs:

HCO PL	29 Dec. 82RA II Rev. 21.1.91	AKH Series 45 Exec Series 24 Org Series 45 Esto Series 45 THE TOOLS OF MANAGEMENT
HCO PL	31 July 83 II	AKH Series 49 Exec Series 27 Org Series 47 Esto Series 48 MANAGEMENT TOOLS BREAKTHROUGH

The following is a list of the materials which, out of the many tools of management, comprise the BASIC MANAGEMENT TOOLS.

1. *ADMIN SCALE:* A scale for use which gives a sequence (and relative seniority) of subjects relating to organization. The scale, from the top down, includes: Goals, Purposes, Policy, Plans, Programs, Projects, Orders, Ideal Scenes, Statistics, Valuable Final Products. The scale is worked up and down until it is (each item) in full agreement with the remaining items. In short, for success, all these items in the scale must agree with all other items in the scale on the same subject.

2. *TARGET POLICY:* A series of policy letters which describe each type of target and how they are to be used by staff, executives and management personnel to get something *done.*

3. *STRATEGIC PLANS:* A STRATEGIC PLAN is a statement of the intended plans for accomplishing a broad objective and inherent in its definition is the idea of clever use of resources or maneuvers for outwitting the enemy or overcoming existing obstacles to win the objective. It is the central strategy worked out at the top which, like an umbrella, covers the activities of the echelons below it.

4. *PROGRAMS:* A PROGRAM is a series of steps in sequence to carry out a plan. Programs are made up of all types of targets coordinated and executed on time.

5. *PROJECTS:* A PROJECT is a series of guiding steps written in sequence to carry out one step of a program, which, if followed, will result in a full and successful accomplishment of the program target.

6. *ORDERS:* An ORDER is the direction or command issued by an authorized person to a person or group within the sphere of the authorized person's authority. It is the verbal or written direction from a lower or designated authority to carry out a program step or apply the general policy. Some program steps are so simple that they are themselves an order or an order can simply be a roughly written project. By implication an order goes from a senior to juniors.

   All orders of whatever kind by telex, despatch or mission orders must be coordinated with current written command intention. You can destroy an org by issuing orders to it uncleared and uncoordinated. Coordinate your orders! Clear your orders!

7. *COMPLIANCE REPORTS:* A COMPLIANCE REPORT is a report to the originator of an order that the order has been done and is a completed cycle. It is not a cycle begun, it is not a cycle in progress, it is a cycle completed and reported back to the originator as done.

   When an executive or manager accepts "done" as the single statement and calls it a compliance, noncompliance can occur unseen. Therefore, one must (1) require explicit compliance to every order and (2) receive the evidence of the compliance pinned to the compliance report. Such evidence might be in the form of copies of the actual material required by the order and procured, or photographs of it, ticket stubs, receipts, a signed note stating the time and place some action was carried out, etc. Evidence is data that records a "done" so somebody else can know it is done.

   It is up to LRH Comms, Flag Reps or execs to verify reports of dones or get dones done. True compliances to evaluated programs are vital.

8. *TERMINALS:* A TERMINAL is something that has mass and meaning which originates, receives, relays and changes particles on a flow line. A post or terminal is an assigned area of responsibility and action which is supervised in part by an executive.

   A fixed-terminal post stays in one spot, handles specific duties and receives communications, handles them and sends them on their way.

   A line post has to do with organizational lines, seeing that the lines run smoothly, ironing out any ridges in the lines, keeping particles flowing smoothly from one post to another post. A line post is concerned with the flow of lines, not necessarily with the fixed-terminal posts at the end of the lines.

9. *LINES:* A LINE is a route along which a particle travels between one terminal and the next in an organization; a fixed pattern of terminals who originate and receive or receive and relay orders, information or other particles.

A COMMAND LINE is a line on which authority flows. It is vertical. A command line is used upward for unusual permission or authorizations or information or important actions or compliances. Downward it is used for orders.

A COMMUNICATION LINE is the line on which particles flow; any sequence through which a message of any character may go. It is horizontal.

The most important things in an organization are its lines and terminals. Without these in, in an exact known pattern, the organization cannot function at all. The lines will flow if they are all in and people wear their hats.

10. *ORG BOARDS:* An ORG BOARD (ORGANIZING BOARD) is a board which displays the functions, duties, sequences of action and authorities of an organization. The org board shows the pattern of organizing to obtain a product. It is the pattern of the terminals and their flows. We see these terminals as "posts" or positions. Each of these is a hat. There is a flow along these hats. The result of the whole org board is a product. The product of each hat on the board adds up to the total product.

11. *HATS:* HAT is a term to describe the write-ups, checksheets and packs that outline the purposes, know-how and duties of a post. It exists in folders and packs and is trained in on the person on the post to a point of full application of the data therein. A HAT designates what terminal in the organization is represented and what the terminal handles and what flows the terminal directs. HATTING is the action of training the person on the checksheet and pack of materials for his post.

12. *TELEXES:* A TELEX is a message sent and received by means of telex machines at specific stations hooked up with one another. This is a fast method of communication, similar to a telegram or cable.

    Use telexes as though you were sending telegrams. Positiveness and speed are the primary factors. Cost enters as a third. Security enters as a fourth consideration. All have importance but in that order.

    Telexes must be of such clarity that any other person in the org can read and understand them. You must take responsibility for both ends of a communication line. Write your communication (telex) so that it invites compliance or answer without further query or dev-t. Entheta in telexes on a long-distance comm line is forbidden.

    Don't use telexes when despatches will do. Nonurgent communications on telex lines jam them. Do NOT put logistics (supply) on a telex line. Telex lines should only be used for communications concerning operations.

13. *DESPATCHES:* A DESPATCH is a written message, particularly an official communication. When writing a despatch, address it to the POST — not the person. Date your despatch. Route to the hat only, give its department, section and org. Put any vias at the top of the despatch. Indicate with an arrow the first destination. Sign it with your name but also the hat you're wearing when you write it.

As with telexes, despatches must be written so clearly that any other person in the org can read and understand them, with the originator taking responsibility for both ends of the communication line. And, as with telexes, entheta in despatches on a long-distance comm line is forbidden.

14. *STATISTICS:* A STATISTIC is a number or amount *compared* to an earlier number or amount of the same thing. STATISTICS refer to the quantity of work done or the value of it in money. Statistics are the only sound measure of any production or any job or any activity. These tell of production. They measure what is done. Thus, one can manage by statistics. When one is managing by statistics they must be studied and judged alongside the other related statistics.

15. *GRAPHS:* A GRAPH is a line or diagram showing how one quantity depends on, compares with or changes another. It is any pictorial device used to display numerical relationships.

16. *CONDITIONS:* A CONDITION is an operating state. Organizationally, it's an operating state and oddly enough, in the MEST universe, there are several formulas connected with these operating states. The table of conditions, from the bottom up, includes: Confusion, Treason, Enemy, Doubt, Liability, Non-Existence, Danger, Emergency, Normal, Affluence and Power or Power Change. There is a law that holds true in this universe whereby if one does not correctly designate the condition he is in and apply its formula to his activities or if he assigns and applies the wrong condition, then the following happens: He will inevitably drop one condition below the condition he is *actually* in. One has to *do* the steps of a condition formula in order to improve one's condition.

17. *PERSONNEL FOLDERS:* A PERSONNEL FOLDER is kept in HCO for each person employed by the org. The folder is to contain all pertinent personnel data about the person: name, age, nationality, date employment started, address (if other than the org), next of kin, social security number, test scores, previous education, skills, previous employment, case level, training level, name of post, former posts held and dates held, production record on post(s), date employment ceased, copies of all tests, and any other pertinent data.

    Copies of contracts, agreements or legal papers connected with the person are filed in the personnel folder. The originals of such papers are kept in the val doc files.

    A personnel folder is used for purposes of promotion and any needful reorganization and so should contain anything that throws light on the efficiency, inefficiency or character of personnel.

    Personnel folders are filed by division and department in HCO, with the personnel in separate folders filed alphabetically in their department. There should be two sections in the personnel files: (1) present employees and (2) past employees.

18. *ETHICS FOLDERS:* An ETHICS FOLDER is kept in HCO for each individual staff member. It is a folder which should include his complete ethics record, ethics chits, Knowledge Reports, commendations and copies, as well, of any

justice actions taken on the person, such as Courts of Ethics or Comm Evs, with their results.

Filing is the real trick of Ethics work. The files do 90 percent of the work. Ethics reports patiently filed in folders, one for each staff member, eventually makes one file fat. When one file gets fat, call up a Court of Ethics on the person and his area gets smooth.

19. *FILES:* A FILE by definition is an orderly and complete deposit of data which is available for immediate use. As FILES are the vital operational line it is of the GREATEST IMPORTANCE that ALL FILING IS ACCURATE. A misfiled particle can be lost forever. A missing item can throw out a whole evaluation or a sale. It is of vital interest both in ease of work and financially that all files are straight.

20. *DATA SERIES:* The tool to discover causes. The administrative technology described in these policy letters is applied to find what is logical by ferreting out what is illogical, using this to reveal the greatest outness which, when remedied, will resolve the scene.

There is considerably more data on each of these tools contained in the policy letters in the OEC Volumes and Management Series Volumes, *none* of it complicated or difficult to grasp.

The purpose of this policy letter is simply to advise the exec that these *are* his tools — his most fundamental and basic management tools. And that they are for USE and it is VITAL that he USE them.

Why? Because use of these simple, basic tools means the difference between a failing org and a flourishing one.

And we want organizations to flourish!

		BASIC MANAGEMENT TOOLS

THE FIRST THING AN EXECUTIVE OR MANAGER AT ANY LEVEL NEEDS TO KNOW IS THAT HE HAS *TOOLS* WITH WHICH TO MANAGE.

This applies to top levels of management, to middle management echelons and in every org from the CO or ED down through the Exec Council and every head of a division or department.

BREAKTHROUGH

This datum is the result of a recent, eye-opening breakthrough.

The breakthrough was not a matter of discovering or developing or improving the materials which make up the tools of management. Org boards, the Admin Scale, target policy, planning and programing, statistics, graphs and conditions (to name a few of these tools) have been a part of our technology, well defined, available for use and used for quite some years now.

THE BREAKTHROUGH WAS IN DISCOVERING THAT A GREAT MANY EXECUTIVES DID NOT LOOK UPON THESE AS *TOOLS*.

NAVIGATE

CONTENTS
ORG BOARDS
INDEX

But unless one does recognize them as tools, unless one actually puts them in the *category of tools,* like rakes and shovels and wheelbarrows, he is apt to think of them as opinions or theories or something of the sort. He won't recognize that he does have actual *tools* with which to manage. And, not realizing this, he won't USE them in managing.

Such a scene could be compared to somebody building a house who didn't even know he was trying to build a house and, should this be pointed out to him, he would look at hammers and saws as if they were total strangers. He wouldn't wind up with a house.

Any activity has its tools. And if one is going to engage in an activity, he had better know what its tools are and that they are for use.

BASIC MANAGEMENT TOOLS

We are rich in management tools but the most fundamental of them, required for use at any executive level from the highest to the lowest, are these:

ADMIN SCALE

TARGET POLICY

STRATEGIC PLANS

PROGRAMS

PROJECTS

ORDERS

COMPLIANCE REPORTS

ORG TERMINALS

SPECIFIC LINES

ORG BOARDS

HATS AND HATTING

TELEXES

DESPATCHES

STATISTICS AND GRAPHS

CONDITIONS

PERSONNEL FOLDERS

ETHICS FOLDERS

FILES

DATA SERIES

Each of these fundamental tools is defined and covered briefly in HCO PL 31 July 83 I, BASIC MANAGEMENT TOOLS.

NAVIGATE
FIRST PAGE
SEARCH
FIND
AGAIN
EXIT
CONTENTS
ORG BOARDS
INDEX

None of these are complicated. They are actually SIMPLE but VITALLY, VITALLY IMPORTANT.

One gets some terminals, gets them some lines, gets the channels of command and echelon worked out, gets in strategic planning and with that one can achieve some coordination.

But it is necessary to be able to conceive of purpose (which, in target policy, becomes objectives). And it is necessary to be able to write targets that will accomplish that objective or that purpose. To get the targets done one needs lines and terminals there. And to have lines and terminals, of course, one has to have an org board.

SIMPLE. But VITALLY IMPORTANT.

In laying out these tools we are laying out the fundamentals of organization as that, most definitely, is what these tools are. And these tools will give one an organization. Without them, you don't have an organization, you have a mob. And if one cannot figure out purpose or objectives or write targets and telexes and get hatting done and hats worn they'll just keep on being a mob. But correct use of just this basic list of management tools can turn a mob into a producing organization!

EXEC STATUS ONE CHECKSHEET

A fast, instant-hat type of checksheet called Exec Status One is being provided to swiftly train execs and managers at all levels on these tools.

This is not a substitute for an OEC or FEBC. But it is vital that an exec starts using these tools right now, instantly and at once yesterday, if he considers himself an executive or is in a position of handling an organization of any type, size or kind. Because if he doesn't use these tools, he's going to lay an egg.

ETHICS

Once the exec has passed this first checksheet, Exec Status One, it's an ethics offense to fail to use these tools properly. One would handle a first or second offense with cramming, but after that it's a Court of Ethics and, in the case of a person having trained on these tools continuing to misapply or not apply these tools, it becomes a matter for a Comm Ev.

SUMMARY

1. First, an executive or manager must know that actual TOOLS EXIST for his use in managing.

2. Second, he needs to know WHAT his tools are.

3. Third, he must realize that these tools are SIMPLE but VITALLY, VITALLY IMPORTANT, that they are for USE and he must *USE THEM*.

HCO PL	23 Feb. 78	LRH Comm Network Series 19 BOARD OF REVIEW
HCO PL	24 Feb. 72 I	INJUSTICE
HCO PL	29 Mar. 82	Personnel Series 30 Esto Series 43 PERSONNEL POLICY

People generally fall into three types:

1. Those who go along handling life,

2. Those who get into bad situations occasionally and have to be pulled out of them, and

3. Those who are incorrigibly making sure that nothing ever gets anywhere.

This is a very high generality but it has some workability in application.

Those in category 1 don't need any correction and are self-correcting.

Those in category 2 can be corrected and will then fly right.

Those in category 3 are simply dedicated losers and will continue to be dedicated losers until they have been put through an extensive program of Sec Checking and PTS checking for nonsurvival considerations and evil purposes on all dynamics.

It usually depends on the person's track record but mostly whether the person has actually been productive or counterproductive as a way of life.

This data is especially relevant to execs, HCOs and Quals.

Boards of Review also should know this data as sometimes people in the middle category are unjustly removed or dismissed when they should have simply been corrected. Sometimes people in the first or second category are gotten rid of by people in the last category. So this too must be watched for.

In investigating along these lines, your target is simply justice or injustice.

HATTING AND THE ENVIRONMENT

There is a single difference I have spotted between past environments I have hatted people in and the current environment. The sea, war, expeditionary wilds are all very dangerous places and a person either gets hatted or he kicks the bucket most gruesomely, not because some senior will clobber him, but because the environment will not only wipe him out but torture him in the bargain.

Now, suppose you had a junior who was always sending problems to you. He never handled them or recommended any handling or tried to prevent them. He even invented them. What would you think of a staff member who did that? Charitably, you could say that he is just green or untrained or deaf or blind or that he has lots of Mis-Us. In some cases these may account for this type of behavior. But there is also this other factor of the environment.

I have taken illiterate crews who were the dregs of the docks and hatted them up into a crack crew very quickly. These guys weren't just illiterate, they were even in awe of someone who could read because they couldn't. Yet, they could be hatted and rapidly. The difference between this and training staff in our orgs is that these guys had to be able to operate in an environment which would have no mercy on them if they failed. They were forced by the environment to know their hats and wear them if they wanted to survive.

A senior in an org can bring duress on his juniors to get the job done. However, this duress, or even threat, is only coming from a senior, not from the environment. A staff member might feel that he has nothing to lose if he doesn't get hatted. He won't get tortured or killed. He'll just have some senior a bit mad at him which is really a bit mild.

In other words, we are apparently trying to hat people in a totally safe space with no threat to them whether they get hatted or don't. After all, someone will pick up all the pieces and pay all the bills, or they can blow and go back to their pot.

Factually, the environment we live in could eat us up. There is more threat to a staff member personally in not doing his job right now than the sea or war or anything like that. The threat to us if we don't make it is eternity.

One could ask a staff member that refuses to get hatted how he would like to spend all of the coming eternity blind, in the dark and in pain. He would probably say he wouldn't like that. But if we don't make it, that's what we've got and that's what he is condemning this planet to.

This probably would sound quite mad to some, yet is the most stark truth I have ever uttered.

A staff member who refuses to get hatted and get out real products does not know what we are trying to do. He doesn't realize that he himself, next life, is for it if we don't make it.

If a sailor didn't get hatted, he only died once in his estimation. If staff in our orgs don't get hatted, they're condemning themselves and the planet to death a thousand times over.

So understand that no matter how mild the environment might appear to you, we are actually fighting a full-scale war against ignorance and enslavement. But we *do* have the tech to win.

LOST TECH

(Written on 8 Nov. 79. Issued as
an HCO PL on 21 Sept. 95.)

Modifies: HCO PL 9 May 74 PROD–ORG, ESTO AND OLDER SYSTEMS RECONCILED

I've just realized that the Esto and the prod–org system, both of which were successful in their day, have been totally dropped. One executive apparently had a confusion on the two systems and could not reconcile them and so stopped pushing both of them. That is my Why for some org failures.

The prod–org system was enormously successful and has been dropped. The Esto system had limited success and has been dropped. The reason for the failure of the Esto system was earlier isolated — the Supervisors let the Esto trainees fake their way through their study of the subject. They just didn't study the subject and then went around running into walls. This was true even though they were given heavy intensive training on it. They didn't do the training.

This comes up because of a cram done on this executive which states that he could never reconcile the two systems and has had a confusion on them. This definitely must have shown up during his tenure as an executive and it brings to mind right this minute that the prod–org system and the Esto system may never have been pushed in. This executive violated the normal actions of prod–org and org establishment. But this bares the fact that management and orgs may not be pushing either the prod–org system nor the Esto system and this could, in large measure, account for the fact that orgs in some cases became disestablished and ceased to produce and deliver.

The exact goof which this executive made is important to understand — he put the Service Product Officer over the Esto and made the Esto the org officer of the Service Product Officer, and hoped from this that his org would be established. Of course it wouldn't be established at all because a product officer's org officer normally specializes in disestablishment — org officers have tended mainly to tear up the org in

the name of production. That is by our experience. An org having an Esto, recruits up an Esto corps. That is the only thing that will get posts filled and hatted.

These two systems must be represented on any org board. The product officer must be on those org boards, the product officer's org officer must be on those org boards. And the Executive Esto must be on those org boards. Otherwise these systems will continue to be submerged.

I mention this in order to get into action both the prod–org system and the Esto system. They must be called strongly to attention, otherwise they will go on being neglected.

This could be a major downfall of management and orgs if one just ceased to push these two successful points.

Thus I am calling to your attention the fact that you should use these systems so that we can recover this lost tech.

SCIENTOLOGY FIVE

PRESS POLICIES

(Tech Dir to Star-Rate Examine HCO Sec and Assoc Sec, any HCO Exec Sec and any Special Programs Director on the theory and practical of this policy letter and report to me when so done.)

This HCO Policy Letter modifies press policy.

We do not care if Scientologists communicate to the press but if they do there are certain points to keep in mind.

Certain vested interests, mainly the American Medical Association, a private healing monopoly, wish to do all possible harm to the Scientology movement over the world in order to protect their huge medical-psychiatric income and desired monopoly which runs into the tens of billions annually. In their congresses they complain that we and people like us cost them 1.1 billion dollars a year that they don't receive. Their sole interest is income. Reference: Minutes of various AMA conferences. Almost all our bad publicity and attacks are authored by two men, one named Keaton, the AMA press man, and one named Field, their head of "investigation." These men flood bad tales about Scientology into press, magazines, radio, TV. Their sole interest is a medical-psychiatric monopoly for the AMA. They blind the public to the fact that the crimes of psychiatry are medical crimes, not crimes of mental healing. The medical-psychiatrist is a very small part of the world of psychiatry. They want it all for physical medicine. The sole reasons for attack are money and monopoly. If ethics entered into it they would clean up their own failures. Their publicity goes overseas. The FDA is used by these people and FDA releases are sent overseas.

I don't care whether anyone thinks this shouldn't be or thinks it isn't right. It isn't. It's just fact and we have the evidence in black and white.

We have always had policies of leaving healing alone and not attacking medicine and other areas of psychiatry. Our pay for this is receiving continual bad press.

Medical doctors practicing psychiatry are peculiarly vulnerable. Their physiological technology belongs to the nineteenth century. It has innumerable crimes on its hands. Hitler and Stalin held power through medical-psychiatry. They associate themselves chiefly with the rich and powerful. They therefore cannot stand up to any heavy attack. Further they have many overts.

We are modern, twentieth century. We are of the people. We hate fascism and brutality. We are the new replacing the old. We have passed the test of survival. Despite thirteen years of attack we have survived. Therefore we must have something and we must be all right. So much for the justice or truth of such attacks.

THE REPORTER

The reporter who comes to you, all smiles and withholds, "wanting a story," has an AMA instigated release in his pocket. He is there to trick you into supporting his preconceived story.

The story he will write has already been outlined by a sub-editor from old clippings and AMA releases.

He probably knows as well as you do that you are decent and effective.

He has no power whatever to alter the preconceived story he has been ordered to write. If he were audited or otherwise totally convinced of the great value of Scientology he would still write the same critical story. If he didn't he would probably get sacked. So the time you spend trying to convince him of your decency and effectiveness is wasted time.

He wants a story. The only ways to handle him are to eject him or to give him a story that he thinks is a story. There are no halfway measures.

If he publishes outright lies sue his paper for libel if you like, but don't be afraid of what he will write. Central Organization income usually rises during bad press campaigns. So he can't really harm you whatever he does or says. Your job minimum action is to refuse to be led into utterances that can be misconstrued.

Contrary to what he may want to believe, press doesn't always mold public opinion.

No bad product sells, no matter how much advertising it buys or how much good press it has. Bigger than press is word of mouth. If advertised products don't have good word of mouth they don't sell.

We have good word of mouth and will continue to have it as long as we give service.

So good service and being decent are superior to even good press. Be decent, then, and give good service and, good press or bad press, we'll still make it.

We prefer no press because it slows our word of mouth amongst the people.

However, bad press is no catastrophe. So the reporter cannot really hurt you and is nobody to be feared. Pitied, rather — for if he does write what he really feels, he'll get sacked. That's what makes him sick and cynical. He may know you're decent and effective and yet he'll have to go write what he's told to write.

Even if you handed this policy letter to him and he said it wasn't true, he'd have to write stories that follow the points below.

So actually he's on a spot. He'd have to sell out the human race if his editor told him to.

But he would write a different story if he found one that fitted his pattern of requirements.

STORY RULES

If you want to give him a story he will publish you have to know these rules, for they are the rules he follows.

The rules of newspaper writing today are very exact.

And this is probably a far better analysis of the rules than he has, so you could surely win.

To be printed a story must contain one or more of these things:

1. HARM (BLOOD, VIOLENCE, DAMAGE, DEATH, SCANDAL)
2. SEX
3. MONEY
4. BIG NAMES
5. The story must be written to *INVALIDATE* something.
6. The story must contain a *CONTROVERSY*.
7. A story must contain TWO OPPOSING FORCES. Dialectic materialism is the basic philosophy used by the society at this time. This philosophy is crudely stated in the following statement: "It takes two opposing forces to produce an idea." The Scientologist recognizes this as reliable items in a Goals Problem Mass but it is real to editors as TRUTH.

Therefore a *great* story to a newspaperman contains nearly all of (1) to (4) above and (5), (6) and (7).

This is the formula on which modern newspapers operate. They don't publish any other kind of "news story."

You could be elected Queen of the May and the headline would be "Controversy Rips Queen Election. Sexual Bias Hinted."

If you inherited a billion happily from an uncle who loved you and were all set to help the millions with it, the news story would be "Foul Play Hinted in Uncle's Death. Rights of Heir Challenged. Sex Life Probed."

And that's the isness of the entheta called news.

This sounds like criminal gossipmongering. It is. But it's also the total formula of news in this century. It's what the editor *believes* sells papers. It may not even do that but they *believe* it does. And the publisher, hounded by economics, *must* sell papers to stay alive.

A SCIENTOLOGY LIABILITY

If you give him any story at all, the reporter must wind it into the above formula or it won't be published. He may not even be after you or mad at you. He just *has* to write "a story" along the above lines.

If you talk only about Scientology, according to (7) he must furnish another terminal, so he adds in "the public" and makes Scientology oppose "the public interest." He has, then, no choice but to make Scientology dangerous to the public.

As he has a rule in (1) about harm and he can find no blood, he is driven to inventing something that harms something or has harmed something.

In (2) he must have sex so he has to invent some sex.

In (3) he has to talk about our fees because money is a great story requirement.

In (4) he has to have names and so has to use my name as the best one known regardless of all the other people in Scientology.

In (5) he has to make (1) to (4) invalidative of Scientology if that's the only item there and he expects the *public* to buy his papers so he can't invalidate the public.

In (6) he has to imagine something questionable or just say we're controversial as he must have a *controversy*. This makes things "timely and interesting" for his editor.

And as I said above, he has to have two forces so he is driven to use the public as the other one to "oppose" Scientology.

Therefore by the very nature of news writing and the singleness of Scientology you get bad press unless you release good press stories of your own guidance.

It is naive to expect good press. Press isn't going to pat anyone on the head. It's going to follow its rules of "what is a story" (1) to (7) above.

Unfair though it may seem, that's still the isness of it.

A GOOD STORY

The best story you can hope for from modern press would have to have all the above elements.

This sounds deadly for us. But it really isn't. All we have to know is their formula, release our own stories using it and be sure it isn't *us* to which they assign the blood, sex, money and names. Let it be somebody else's blood, sex, money and names.

Actually we are pretty dull on the first four points. We're too decent, we give too much service.

They have to imagine bad things to get them in at all.

So let's use their formula if we want press but with a more accurate viewpoint.

DRILLS

First you should glance over some daily papers and satisfy yourself that the news formula above is factual to get some practice and to see how varied the resulting stories become. You will find you can determine where a story would be placed in a newspaper by the number of requirements and the magnitude of one or more of the requirements. And you will be able to predict how long any story will last by seeing how many requirements it fulfills and to what degree.

And you'll be a news analyst. A columnist's story is the exception. He is against things. But he still follows other requirements too. Thus if we were simply against things we would most likely be columnist-type news, not headline.

It's a good drill. Once you've done it press won't ever scare you again. And you can be cause over it.

Take the front-page news stories and a pencil. Check off in any one story as many as you can of story requirements (1) to (7) above by number and the first letters of the requirement.

It's an amusing game. You won't find many missing in any one story and you'll find that those that go front page for days have all of the requirements.

Call that "Something A." We're against it or them.

1. Explain how harmful "Something A" is.
2. Explain the sex aspects of "Something A" or omit.
3. Give figures as to the huge sums connected with "Something A."
4. Give the big names connected with "Something A" and what's wrong with them.
5. Be sure to invalidate "Something A."
6. Explain that "Something A" is controversial and exactly what about it is controversial.
7. As mentioned above be sure to define that you as a force oppose "Something A" as a force and you have a fully designed "news story."

Now and then a skilled press hand can get an idea which has pure INTEREST value. This is essentially a theta story. And in a sane society mostly these would get published. But on releasing them in the present society immediately (1) to (7) gets added to such a story. Take my Tomato Story. "Vegetables react on an E-Meter." Essentially then bodies and vegetables were both of the same order of response. This I made into "Do Tomatoes Feel Pain?" and got international press. But before a week had run the following elements had been added: (1) Crazy to think so, (2) Pretty girl inspires love in a cabbage, (5) Probably not, (6) Controversial. They couldn't manage to increase (4) beyond my name and (7) they couldn't quite manage. It went however and went on for two years with everybody from the U of Texas to the US government getting in on the act.

They are starved for ideas. They are scarce, as you could imagine from a philosophy like Russian dialectic materialism. Therefore the press nurses and continues old stories. They look for but do not expect to find new stories. My last press boy (after I'd batted a theta international press story out for the third time in a year, all carefully figured out) said, "But one *can't* think of a tomato story every six weeks!" He didn't believe it was possible to think of new ideas and also believed that it was impossible to get press.

It's always possible to get press. The hardest press to get is theta press because it's too far from the modern formula. You and I know that theta flows faster than entheta. That makes one wonder what makes newspapers circulate at all. For their formula is enturbulative and therefore unlikely to go far.

From this we can assume, then, that they seek enduring stories, not interesting or communicating stories. So adding time to a story is always good.

"We are *always* getting A-type cases. They must stop this continual selling of A." "It takes years to make a real professional auditor." "We have been trying for years to stop A."

A campaign against vice is always good news. Gets lots of mileage. Because it adds up to all seven points, usually.

To create a news story often requires that you take action. The action need not outlast the news value of the story. This is a special programs sort of job. Example: Teenage girl shows up in HGC who has been beaten and raped by teenage boys at high school and withholding it since. Audit it out, get parents to okay investigation, call in press. Release story of vice and crime at local high school with the org doing the investigation. On subsequent days: Criticize laxity of police. Criticize principal. Finally find more teenage sex cases. Just day by day deal off a new action to the press. String the story out. Take an action, hold a press conference. Put students on meters. Put teachers on meters. Get parents to sue. Finally advise school hire a permanent mental consultant and give daily mental exercises to "teenage mobsters." Then wrap it all up and skip it. You've made something evil become something good attained — Scientology in schools.

You make a calendar of coming events, one day one action. One action one news story. And string it out.

Exercise: Do a story design and calendar for "Scientology Ministers Demand FDA Prove Sterility Pills Aren't Sex Stimulants."

That's press. You cause it. You don't just receive it.

And all press must be calculated at the reality level of the newspapers, not the public.

Most press *agents* (public relations counsels) don't understand press. They often act only to prevent it. Or they try to use me 24 hours a day to specialize on (4). Or they want "stunt press" — like Bernarr Macfadden's parachute jump into Niagara Falls at the age of seventy or some blonde swimming the Channel. This has small value and is chancy press. And preventing press is also chancy for one is only at effect.

If you really want "good" press, get some element that fits all seven of the above requirements, plan an exact series of actions, do them in exact sequence and release a press story for each action. The press will love you.

Now, does it occur to you that it is this exact action (poorly done) that is being undertaken against us by the AMA. Ah, you learn fast! But the difference is theirs is toward a sordid goal.

This is an analysis of current press. It is released to help understand our press situation and our problems.

I am not condoning the current state of press. I am not advising that we go all out for press. I am just giving you data about press and requiring that if you want press or have to handle press it will be successful in this current society only if handled with the above elements firmly understood.

Using these Scientology FIVE data we could be front page 100 days out of every year.

HCO POLICY LETTER OF 25 MAY 1964
ISSUE II

CENTRAL ORGS

PRESS RELATIONS

These instructions are based on a wide experience of how the press, and journalists generally, write about Scientology. They apply not only to daily and weekly newspapers, but to all journalists of any kind—magazines, periodicals, "serious," comic, scurrilous, etc.

Press relations should be entrusted to, and handled by, only one person in an org. This person is specially appointed to the post. Any good Scientologist should be able to do it. *NOT* a professional public relations man. The person chosen should be capable of good communication on Level 0 and Level I. Anyone who can run a good PE Course and who is known not to Q-and-A would be suitable.

The post is not even vaguely full time, not even part time. The hat is assumed only when a journalist writes in or telephones or tries to contact the org about anything. The Press Relations Officer then handles it. All correspondence, cables, telephone calls, anything, are handled *only* by the Press Relations Officer. If he or she is not available, the switchboard operator or Receptionist answers only, "Mr. ——— (the Press Relations Officer) is not available. There is no one else here who can handle it." All inquiries should be handled courteously, but there are no exceptions to the rule.

No one else except the Press Relations Officer handles any press or journalist communications of any kind.

The Press Relations Officer should answer inquiries only on a Scientology Zero basis — maybe a little of Scientology One. He or she is polite but is not tempted into giving any other information about Scientology. Do not Q-and-A. All other inquiries (not directly concerned with Scientology data) may usually be answered factually but will almost certainly be misduplicated, quoted out of context or misrepresented in some way.

The stable datum is: The press will not print anything good — only bad. So give them nothing that can be misunderstood.

This does not alter the truth contained in HCO PL of 14 Aug. 63, PRESS POLICIES. But it should be borne in mind by those who handle press relations that experience has shown that the press prints its own preconceived story anyway. So keep it brief, be sincere, don't defend, don't attack. Don't Q-and-A. And you'll win.

REMIMEO
ALL PRS

PRESS RELEASES

A press release should be on one subject ONLY and this one subject is used in variations time and again. When the press are tired of that subject, then another one is used and that one is ridden until it likewise is worn out.

Also press releases should always contain some factor of endurance. This gives the public the idea that we endure. Examples:

"For many years now we have stated . . ."

"We have stood up to such attacks many times and are still surviving and expanding."

"Since 1950 we have . . ."

"Eighteen years ago . . ."

A good time to make press releases is on a Monday. Newspapers have shot all their bolts in the Sunday newspapers, so this makes Monday a rather quiet day for news.

So remember — push one subject until that has worn thin, add endurance and release press stories on Monday.

ALWAYS ATTACK in a press release. Never defend or deny.

HCO POLICY LETTER OF 3 FEBRUARY 1969

REMIMEO

PUBLIC IMAGE

For a long while we have not had an exactly stated policy on building a public image. We have just been ourselves and done our jobs and hoped somebody would catch on. This is basically what protected us. And we should keep doing it.

But the time has come to also build a public image as an outflow publicity action.

The image is:

SCIENTOLOGISTS ARE THE PEOPLE WHO ARE CLEANING UP THE FIELD OF MENTAL HEALING AND EFFECTIVELY HANDLING MENTAL HEALTH ON THE PLANET.

Note that it is dual. We will handle the first part of it first, "cleaning up the field of mental healing." It is a dirty inhuman rotten field, full of graft, misappropriation, phony authoritarianism and betrayal. Because it is like this we get a backflash from it. We are the only ones in it who have clean hands and effective technology. So we have no choice but to NOISILY clean it up. That builds that much of the image. By uniting with other civic, humanitarian and civil and human rights groups we can make an organized progress.

For the second part, we are already doing it to a degree. "Effectively handling mental healing on the planet" is what we are being effective in doing. But we don't make enough public image with it. We keep building the image to Scientologists. We must study how to do it outside.

We have clean hands. We are effective. We dedicatedly do our jobs well. We must keep on doing this.

But we have to find more PUBLIC ways to SAY so.

It would also be a good policy to have two PROs. One specializes and plans to clean up the field of mental healing and grabs allied organization support, holds committee meetings, works on crusades about it, gets close to top publishers and really scareheads the world or area about the abuses to human rights in the field.

The other PRO works to banner-head the successes and the programs to effectively handle mental healing on the planet. He also gets support from allied organizations (different than human rights attacks) like churches and gets a crusade going for handling all the mental healing problems, not just using Scientology.

In both instances you have to go civic, go outside Scientology, get support, organize committees, plot out campaigns, work for outside finance, etc.

In handling the above public image policy, you don't announce the policy. You use it for a guide to keep pounding variations of the same message.

The policy is expressed in community *action,* well press covered, not just in statements. Committee meetings, deputations, picketing, big names, events.

You figure out the story that will be written, then *do* it, seeing it gets covered by having the press to hand.

Make all issues hot, exciting, brutal or sensational. Go strictly circus in the type of message.

You can and must ally with real humanitarian and civil rights groups (getting press coverage for every such contact).

You can and must approach governors, parliamentary committees, big names, big activities *and* get press coverage for every contact.

Scientology speakers must address groups and *say* the story which is to appear, not just talk about Scientology.

Plan a program, let it run awhile. The program is based on the policy which is the major target — to make that public image. When *that* program damps out, get a *new* program. It takes a while to beat a program into the public mind. They last a few months.

This is almost standard PRO work. The press prints "hard" news. Hard news is an event, a meeting, the formation of something, an attack, a campaign. It is not a statement.

You can and must seize the attention of the press in your area, not to defend Scientology, but to hammer home the above public image by forwarding crusades and campaigns that carry the message. Then providing events of your own manufacture. Then seeing they get reported in the press, on radio and TV.

Don't defend Scientology, attack bad conditions and bad hats.

It is a dismal flub to force a parliament to consider a bill outlawing psychiatry and then provide no other event about it or press coverage. It has to be planned, targeted. You have to have other groups start talking, public meetings, a deputation to the governor.

Build up Scientology celebrities that can speak and meet the public in your area.

And in doing all this don't tear up the Scientology org or distract it too much or you will not have any money to do the job with. You will have lost what you're trying to save.

PRO is an energetic, imaginative fiery-eyed function. It has to be hot — hot on getting compliance, scheduling and events.

PRO should know all about targets, dev-t and this policy letter.

Scientology has been the object of enemy PRO campaigns of a professional level for years. Study if you like the stunts *he* pulled. How did *he* do it? Just by using names, connections and press. So reverse the action. Do it *far* better.

Our end product is a sane planet. His was a dead one. So with all the theta in our lines and purpose, Scientology PRO to the PUBLIC can be ten thousand times as effective and worthwhile.

This public image can and *must* be built if this planet is to survive at all.

HCO POLICY LETTER OF 5 FEBRUARY 1969
ISSUE II

REMIMEO
ALL PRS

PRO ACTIONS

Star-rate
In Clay

The purpose of a Public Relations Officer is TO FORMULATE, GUIDE AND UTILIZE PUBLIC OPINION TO THE END OF ENHANCING THE REPUTE AND EXPANSION OF HIS ORGANIZATION OR CLIENT.

To do this the PRO PROVIDES EVENTS TO CARRY FORWARD THE MESSAGE OR NAME HE WISHES STATED.

He utilizes word of mouth, persons, publications, and news media of all types. The publications can be his own or general public ones. News media can be his own or general public ones.

A PRO uses ideas to act as a carrier wave for his message. By carrier wave is meant the impulse to forward them along.

He becomes conversant, by study of various media, of what is considered *event*. Meetings, deputations, significant dates, combinings and separations and many other things are events.

A PRO can plan a series of events each with its message, leading up to a major event.

He forms groups, committees, alliances, to carry his message as attached to an *event*.

A PRO RELEASES HIS NEWS EFFECTIVELY ALONG AS MANY CHANNELS AS POSSIBLE. But the main thing to do is *release the news*.

Even a bad counter-event can be used by a PRO to carry his own message.

A PRO has to know what his message *is*. He has to use his imagination to provide means of getting the message carried.

You would usually be amazed what press, radio, TV, magazines consider an *event*. You only have to study them to find out. The event is usually trifling. A committee meeting, a club addressed, a deputation.

A PRO doesn't let an event go by without getting it reported on and getting his message into it.

A PRO uses the same message over and over for months, even years. He gives it infinite variety, provides infinite events. Just to get his message repeated.

A knowledge of the ETHNIC values of the public to whom he is communicating is vital. What they think is wonderful, good, passable, bad, awful. He can get these by survey or by studying what the public *has* reacted to in the past in other fields.

He makes his organization compare to the wonderful, good ETHNICS. He makes the enemy compare to the bad, awful ethnics.

A PRO watches the enemy trend and counterplays skillfully to turn it to his own advantage.

A PRO must study and use the HCOBs on the antisocial personality for various reasons.

Big names, big organizations are the best in furnishing events.

Most PROs are (in most companies) pretty poor. They do not know these data. Therefore they can be surpassed easily.

Scientology has been the effect of PRO actions of this nature all its life. To reverse public opinion it is necessary that one really learns PRO actions.

A Scientology PRO is way out in front. The orgs do well. The tech is tops. Scientology has a complete technical monopoly in mental healing. Its people are decent and stand up very well. With this to *start* with, doing the job is a cinch IF one follows this HCO PL.

Modern press is following the example of *Paris Match*. This periodical says there must be a CONFLICT. This is modern journalism.

Press follows the lead of the ATTACKER. Providing the attack is upon some real or imagined abuse or violation of public mores.

EXAMPLE

J. Big, a Scientologist, addresses (arranged by org PRO) the Ladies Auxiliary. J. Big is instructed to say what Scientology is and also to attack some (perhaps recent) public abuse. PRO gets the text and a comment of the Ladies Auxiliary and MAKES SURE IT GETS INTO PRESS.

EXAMPLE

Three weeks of news stories are designed. A pathetic girl abused by psychiatrist comes to Church of Scientology for help to get guidance to right the wrong. That's a story with photos. Church of Scientology committee visits sanitarium. Is refused entrance. That's a story. Church of Scientology committee seeks and can't obtain death records of the sanitarium. That's a story. Church of Scientology committee visits big

NAVIGATE

name in government to force death list to be given out. That's a story. Church of Scientology committee meets with a law society committee to recommend legislation. That's a story. Girl treated by a medical doctor paid for by Church of Scientology and Scientology processing helps girl. That's another consecutive story. Citizens' committee urges police action to close sanitarium. That's another story. Girl restored to family by Church of Scientology committee. That's a story.

You see what an *event* is? And what a story is?

A PRO gets ideas like this and carries them out and gives them out so they'll get published.

A TV challenge of a psychiatrist to demand why he kills people.

This is all PRO.

A PRO must be a good organizer. He must be fast.

Note that nothing really happens in most of these events. They use man's fixation on groups.

This HCO PL is a rapid coverage of modern PRO work. It is not what we have been doing. It is what PROs do over the world when they are on the job.

HCO POLICY LETTER OF 17 JUNE 1969

REMIMEO
PRO COURSE
CHECKSHEET
DIV 6

THE ORG IMAGE

A poor org public image can cost an org nine-tenths of its income, thus greatly curtailing pay and facilities. It can lead to trouble with the area. It can reduce the expansion of Dianetics and Scientology to near zero.

When important people enter an org and find its premises messy, themselves and their requirements neglected, the org not only loses their fee, it also loses the important friends who would actively protect it.

If an org and its staff display a downstat image, public confidence in Dianetics and Scientology is shaken.

By showing a good org mock-up, we are living examples of what Dianetics and Scientology can do.

There are several zones which comprise the org image.

1. Premises, particularly the entrances and interview and service areas. These should be neat, not cluttered up with baggage, paper, tattered notices or unsightly things.

2. Public comm lines. Letters and mailings should be correctly addressed with the right name and not sent to several addresses for the same person. The appearance and tone of any mailings and communications should be good and not offend. “Friendly and agreeable responses” was the first order I ever gave to an org.

3. Staff. Appearance and attitude to the public.

4. Service delivery, assurances of.

5. Publicizing values of service.

6. Publications, appearance and suitability of distribution.

7. Alliances with suitable groups and leaders, with due regard to local “ethnic” values (publicly admired values).

8. Eradication of enemies on public lines with due regard to local ethnic values (publicly detested values).

9. Alignment of promotion with things publicly admired and against things publicly detested.

10. Advertising, effectiveness, suitability and lawfulness of.

11. Membership expansion.

12. Group expansion.

13. Expansion planning of facilities.

Contemporary "Public Relations Officer" duties in business firms are not as embracive as the above 13 points by considerable. These are loosely classified as follows (quoted from their texts).

"1. To keep management informed of public opinion, and of events and trends likely to affect its reputation.

"2. To advise management on the policies and actions it should adopt in order to gain and keep public goodwill; and on the likely effects, in terms of public opinion, of any policies and actions dictated by other factors.

"3. To apply public relations techniques to solve problems in which the company's reputation is at stake and to maintain a continuing, positive program of action to secure goodwill, presenting the company in all its aspects to all its audiences by every appropriate means of communication.

"The executive side of the public relations man's work includes the company's relations with the press, radio and television; the production of many kinds of printed matter, including company reports, house magazines, wall charts, brochures and even books; films and film strips; exhibitions; the design of company stationery; the way a firm receives its visitors; a watching brief on the way it answers its telephone calls, writes its letters, handles complaints; its policy on donations to charity and an infinite variety of items beyond."

We often hear that we should hire a public relations firm to do all these things. The catch is that these firms have a high personnel turnover and new men on the "accounts" have to be rebriefed continually.

We have in the past hired contemporary, professional PRO men AND THEY LAID THE FOUNDATION OF OUR DIFFICULT TIMES WITH PRO ACTIONS.

In Dianetics and Scientology we have gone up against a totalitarian conspiracy using "mental health" to control populations. This was not a normal PRO atmosphere as encountered by business firms. It began with war where the enemy controlled all news media and governments.

We had to be very, *very* good indeed *to live through it at all*. Our "public" does not understand this. They are accustomed to sleek, untroubled firms selling them "Wheaties, the Breakfast of Idiots" or "Go Slow gasoline" or "You too can be insane."

So in Dianetics and Scientology we have a job in PRO which far exceeds the usual company demands.

In ordinary PRO actions we have not done too badly in the past. For instance our people handling congresses make the US Democratic Party Convention PROs look like rank amateurs.

The enemy has used all available PRO and intelligence techniques to hold us back, and as the enemy also controlled many key government figures, this has been a very rough time.

That we are alive at all and expanding shows we have not done too badly. The enemy is definitely losing.

The reason for this is INTEGRITY. By and large our people are sincere.

WORD OF MOUTH is a public relations comm line *superior* to press, radio, television or Mr. Big. Radio, press and TV only seek to create "word of mouth." This term means what people say to one another.

By standing for what people think is good and opposing what people think is bad greatly speeds WORD OF MOUTH.

We will go as far as Dianetics and Scientology work in the hands of auditors and no farther.

The enemy, lacking integrity, word of mouth and workable tech, has not won despite total control of governments, press, radio, TV and all standard PRO media, plus financing in terms of billions.

Thus we see that there are three commodities above contemporary PRO concepts. These are:

A. INTEGRITY

B. WORD OF MOUTH

C. WORKABILITY AND USEFULNESS OF PRODUCT

All the PRO advices and direction will not prevail if the above three things are not an integral part of "the company" PRO planning.

How much a product COSTS has some bearing on whether or not it is used. But unstabilizing prices, we have learned (such as a small increase), is utterly deadly. And reducing prices does not actually increase sales in our experience. The exception is the granting of 50 percent scholarships and giving certain courses as field staff member prizes. And here it does seem that the STATUS value outweighs the monetary saving appeal. Therefore STATUS INCREASE is a vital part of the product.

However, whether Dianetics and Scientology have been at war or not, the first 13 points are what we would consider routine PRO actions which, if neglected, would result in heavy income losses.

A staff idling in reception, offhand handling of callers, wrong address or names misspelled drive off customers. Aside from simply blocking sign-ups, these points also REDUCE CUSTOMER STATUS.

As our organizations are built (due to tech concentration) on handling the individual, any PRO must be very alert to any point which would seem to the "customer" to diminish his status.

A PRO should himself look at the given points from the viewpoint of an important potential "customer." Would the org environment and handling attract or drive off an important person (let us say, the mayor) as a "customer"? If the answer is "yes" in any point, then the org is losing up to 90 percent of its income through these PRO omissions.

If a staff is poorly paid or the premises are poorly furnished, cluttered or dirty, then the error lies in either the first 13 or the above A, B, C points of PRO.

A PRO in advising actions to the EC (and he should have direct access to the Executive Council or management) should be very wary of killing off the org's vitality with too much militant control. The PRO also has the staff as a public. If one wants to clear sandwich-eating staff off reception, the best way is to start a campaign for a staff lounge, get it and *then* forbid staff to clutter up reception.

The PRO in accomplishing PRO points is of necessity a creature of ideas even in getting his routine PRO actions done.

The enemy we have had gets very high points on 1 to 13 (omitting 4, assurances of delivery; and 7 and 8, ethnic points). Dianetics and Scientology orgs get rather low points on 1 to 13 (excepting 4, 7 and 8 which they do well).

Dianetics and Scientology orgs do well on A, B and C. The enemy utterly collapses on these.

If Dianetics and Scientology orgs did well on *all* points (1 to 13 and A, B and C), the battle would be won in very little time.

If a PRO is not working to bring points 1 to 13 and A, B and C all into full operation in his area, he is not doing his job. If he *is* doing all these things, he is a very, very valuable PRO and should be given every possible assistance on his job.

ETHNIC SURVEYS

(Taken from LRH tape 6910C21, "It's a PRO World.")

Refs:

HCO PL	5 Feb. 69 II	PRO ACTIONS
HCO PL	12 Nov. 69	APPEARANCE AND PRO
HCO PL	11 Dec. 69R I Rev. 16.9.88	APPEARANCES IN PUBLIC DIVS

You are always at risk operating in an area where you do not know the ethnic values. They don't even have a word for this in English which means exactly that.

It's the mores and customs. It's what do people believe. It's what is right and what is wrong. It is the solution of good conduct.

Ethnics — what is:

Wonderful

Good

Bad

Awful

Infinitely valuable

Valuable

Worthwhile

Unacceptable

Not wanted

Hateful

In an area, you have to figure out what they are beating the drum for. This is known as ethnics.

ETHNICS AND CONTROL

Actually, some of this type of work was done for American troops before World War II. They weren't supposed to do this and weren't supposed to do that, in order to

better their relationships with the native population. But that work was simply based on careless, factual or nonfactual surveys.

If you are going to control or govern or have influence upon an area, you have to make ethnic surveys. You have to find out what is most liked and what is next most liked and what is considered bad and what is considered totally evil. When you've got the lists of those things you know the control buttons of the society. Those are the buttons of control. They aren't just a "study."

I get so tired of reading about a psychiatrist stating, "We're studying the . . ." "And we're going to have . . ." "We had a conference the other day and Professor Blotz advanced his new principle that uh — if people were daffy they were quite crazy. And uh — we discussed this for some hours and 'Are newborn babies happy?'" And they don't even get a midwife in to ask her. That isn't how you do ethnic surveys.

You do an ethnic survey by going out and asking questions and by looking into books and backgrounds of religions. It takes a little while to get ethnic surveys, but you're at risk if you're operating in an area in which you do not know the ethnics of that area.

For example, what is "good conduct"? If you look over today who the heroes of stories are that are being written in the United States and England, you would be absolutely flabbergasted because they obviously are representing the level of good conduct. What is good conduct? What is being good? If you think you can answer this, that is your first mistake. What is good conduct today has very little to do with good conduct yesterday.

But an ethnic survey will resolve it, whereby you go out on a broad-scale basis and you sample enough of the population and you will find out what the new ethnic is and what their basic ethnics really are. Then after you have put together a code of performance for action, or the mock-up, you get *this* critically looked at and then you have it taped. That is putting in your "R."

You would do an ethnic survey, base a program mock-up on the ethnic survey, and then you would get that evaluated as a new survey and put it into operation. It does not necessarily take forever.

MAJORITY OPINION

In doing an ethnic survey you are only interested in the majority. You are studying the human beings in the mass, not their personal prejudices. You can't just listen to *one* newspaper reporter and *one* prejudiced politician — it's too small a sampling. Ethnic samplings have got to be very broadly done.

For example, an ethnic survey was done in South Africa years ago. Something on the order of 49 percent of the people in South Africa were not all worried about the things you would think they were interested in. The most popular characteristic in South Africa was friendliness! The surveyors were looking for something dramatic!

What was most liked in South Africa was friendliness and what was the least liked was narrow-mindedness — that was detested. These were the high, sweeping

majorities. There were no other majorities. There were little things like 11 percent, 2 percent, 1 percent but they were nothing.

It was friendliness versus narrow-mindedness. It didn't even make a dichotomy. All you would have had to say, "Those who are against us in South Africa are narrow-minded because we are the friendliest people in the country!" Immediately the South Africans would have been for you.

That is what is meant by an ethnic survey.

TRUTH VERSUS LIES

Using this tech properly, you can put yourself in so strong locally with all the powers that be that if someone exterior tries to do something to you it just causes one awful stink. Because you are putting truth up against a bunch of lies, and in the final analysis truth always wins.

CONCLUSION

If an organization or group backs up what it does 100 percent with good, sound ethnic surveys, if you plan your program, mock-up or actions based on these surveys, reanalyzed them after they were planned and followed them, you would take the world!

ACCOUNTS AND PRO

It's a PRO world today.

Public Relations Office or Officer is meant by "PRO." It is also slang for "Controlled good relations in the community or area."

When you "PRO" something, you visit, write, handle it so as to enhance and improve your public image.

A terrific amount of PRO effect occurs on ACCOUNTS lines.

Bad or inaccurate statements of debt can ruin your PRO with a customer, pc or student.

Unfair accounts decisions can mess up the PRO of a whole area.

Unpaid bills can ruin your PRO in a whole town.

So there is a lot of PRO connected with accounts actions.

Repairing the damages done by not submitting correct accounts to customers or failing to pay commercial bills or rents or utilities is a PRO action and requires some thought and careful handling so as to restore the org's PRO.

The biggest crime one can commit in this modern society is to be without money. Even in a supersocialism this is a crime.

For an org not to have and make lots of money is stupid. Given a potentially remunerative activity, only thoroughly lousy service and horribly bad handling of promotion or criminal carelessness in accounts can leave an org without money. Doing standard org actions, giving excellent service and adequate promotion brings in plenty of money. The outnesses which prevent income or waste outgo have to be truly glaring and goofy to leave an org without money.

The way to have NO PRO is to have no money at all.

Lack of money or wild outnesses in handling money can practically destroy an org's PRO.

"Credit" as a quality is a sort of god in Western society. If your "credit is bad" that finishes you to one and all. It is a statement far worse than mere "murderer." It must be since psychiatry murders daily but is well thought of in governments.

So you get the extreme value of "good credit."

Dateline paying and other accounts policies prevent bad credit.

But when it has gone bad, it takes making money and brilliant PRO actions to restore a good credit image. AND IT MUST BE RESTORED.

Money as a total motivation for an action is not high-grade motivation. In espionage services the man who works for money only is expected to turn his coat and allegiance and is regarded with contempt.

But money is a basic point of judgment on which higher levels of motivation can be built in a wog world. It *is* PRO to the commercial world which has no real dedications.

So billing debtors and paying creditors have high PRO value to an org.

All this can become a strange cycle. The org mucks up its area, let us say, by bad or indifferent service, promotion then is unreal so the org PRO with customers collapses. These don't buy service. The org runs out of money. Its bills mount up and its commercial community PRO collapses so it has no public credit. There goes the org.

Accounts is the area hit and will go on being hit until it begins to insist on GOOD SERVICE, the repair of all bad service, good real promotion and finds money to spend on PROMOTION. Money will come in. Accounts actions must now PRO the commercial field, get that handled with good PRO accompanied by money on dateline payments and sound arrangements. Further money is spent on more PROMOTION. Former bad service is handled. Credit is reestablished in the area. Any accounts trouble with customers is cleared up. The org is fully there again.

There is no substitute in Accounts PRO for knowing one's finance policy and following it.

Sloppy accounts files, no financial planning, no Purchase Order system, ignorance of finance policy as in the Finance Checksheet can lead an org directly into losing its community PRO regardless of service quality or promotion. So just as Accounts can be mucked up by lack of money coming from bad service or bad promotion, it also happens that Accounts all by itself can wreck an org's community PRO.

Therefore it is VITAL to PRO that an org:

1. Has its Accounts personnel have their Accounts hats on and finance policy being closely followed.

2. That financial planning is real and income remains greater than outgo.

3. That adequate funds are available for promotion and that org funds do not get all soaked up by the HCO ES and OES divisions on filing cabinets and new roofing paper.

4. That the pcs and students (customers) of the org are handled to generate high PRO on their accounts contacts.

5. That the commercial connections of the org in the community, the org's creditors, are smoothly handled to generate high PRO.

6. That any adverse reactions along accounts lines are instantly handled to restore good PRO. These can include a covert operation to one's creditors by some enemy — which is handled by proving the falsity of the accusation. They can include wrong change, failure to refund, reluctant or inaccurate or failed payment to field staff members. These and any other adverse Accounts action MUST be pushed back to good PRO fast.

Lack of money comes from slow or bad service, and a failure to go flat out to remedy it or from no or poor or unreal promotion. Or no money can stem directly from off-policy or messy handling of accounts and org finances.

In the final analysis it's a PRO world and high PRO cannot be effected for an org if there is anything wrong in its accounts lines. Thus, PRO is affected strongly by Accounts and Finance actions.

Our orgs do not go into debt, do not finance themselves by borrowings. Our orgs make their own way. That is why they are still our orgs. And Accounts PRO has a lot to do with it.

APPEARANCE AND PRO

Anyone engaged in a personal contact PRO action should support his action by clean and neat appearance.

He or she is a symbol. A clean bright looking symbol *emanates* by appearance only. Thus, any PRO action is reinforced by one's appearance. As the appearance is acceptable then the thought and words or action is made more acceptable and reinforces one's potential success.

If one's appearance is too bizarre or garish or if a girl is wearing too much perfume, appearance *distracts* from the thought or action and may make it fail.

Similarly a degraded appearance degrades the PRO action. Body odor, bad breath, dirty hands, face or fingernails all degrade one's message or intent and can make one's PRO action, no matter how acceptable otherwise, fail.

One does not have to be handsome or beautiful to reinforce a PRO action. It helps but it often also hinders.

Integrity and sincerity can communicate even more forcefully than appearance.

However, appearance has a definite role in PRO.

For instance, a clean, neatly dressed lecturer has as a rule a far greater impact than one who is either very fancily dressed or at the other extreme, scruffy.

THE ARC OF APPEARANCE

The communication formula contains duplication at either end. In the presence of duplication of type or social class of appearance we get better A (affinity) (can occupy same space), better R (reality) (can agree because of similarity of caste or station in life) and hence communication, lifted by A and R, can occur.

The above is the actual operating law.

Thus, average audiences or persons or persons in the West seeing their ideal of themselves (clean, neat, mannerly), if similarly but slightly better dressed, are impressed by appearance and receptive.

If, however, a PRO person were dressed that same way yet sought to impress or get the agreement of a communist group in the East he probably would fail as he is a bourgeoisie (middle class) symbol. I wonder if you notice that the world's rulers in this PRO world deserted top hats about 1920 and began to become upper-class citizens in business suits by the 1930s and in the 1950s became "men of the peeeeple" in ratty unpressed lounge suits.

To get the attention and sincere agreement of a bunch of collective farmers, one would have to look like their ideal of a very good collective farmer and act accordingly.

On the other hand to PRO a movie star it would be necessary to dress a bit movie star — but not too much as they fear rivals in attention getting.

COVER

All this gets badly disarranged as a law when one enters the wonderland of "cover appearances." Then one must look and act like what the viewer thinks the personal identity adopted looks like. Impersonating a real reporter one has to look like what the person being interviewed thinks reporters currently look like in that area. Notice we say "what the person *thinks* reporters look like." Actually reporters look like tramps or executives or MI6 agents or what have you in real life.

But "cover" is a deception process and depends on perverting the comm formula by fooling the person or persons being seen, addressed or interviewed and belongs more to an intelligence service than PRO.

ILLUSION

However, in PRO, one is actually creating an illusion or symbol that will be considered acceptable by those who see the image compatible with the message one is trying to put across or the data one is attempting to find.

ETHNICS

This subject of appearance is actually an ETHNIC idea. Ethnic means beliefs, mores, customs, patterns of thought or racial or religious stable data.

What do the people being seen think the PRO person should look like, dress like, act like to be asking or talking to them about that subject?

The Walla-wallas think someone with a new product should look like a witch doctor before they believe him. Politicians think one should look like a psychiatrist before appropriating a few billion for him. Savage Ugpugs only accept PRO from fat men. And the Romans only accepted it from bird entrails.

What type of communicator is acceptable? For what message? That is an ethnic survey problem and the answer is only valid for the area in which it is obtained.

It is always what they *think* the ideal symbol is, not necessarily the usual symbol that gives that type of message to them. And it is what symbol is *now* effective as the old one may have become too common.

CONCLUSION

It is not a very involved subject. The comm formula in its entirety should be known and understood in PRO work.

The factors one is trying to instill are acceptability and belief.

Truth plays its own role as it is the highest R (reality) there is. But sometimes the whole truth is too much and again it becomes the degree of R that fits in with the A and C.

Untruth, when exposed, can wreck ANY PRO symbol. And voicing a truth that is unbelievable can also cause the symbol uttering it to not be believable.

The need for impingement (enough jolt to attract attention) causes a lot of wild PRO think. The mobs of people are sufficiently numerous today to cause a "herring effect." No one herring is given any attention by the rest of the herrings. PRO attempts to break out of this inattention by being a more startling herring. But if overdone, the rest of the herrings believe one is a shark.

To solve the dilemma, if it comes to a dilemma, it is best to be one's own self, but a clean, neat, mannerly version of oneself and if one has a message or reason to be there the PRO will usually come off very well.

PRO COURSE

INDIVIDUALS VERSUS GROUPS

The wide survey done in accordance with LRH ED 14 Int, 1 Aug. 68, BROAD PUBLIC QUESTIONNAIRE, the results summarized in LRH ED 37 Int of 23 Nov. 69, REFORM MAILING RESULT, gives us two valuable data:

1. DO NOT LECTURE OR DISSEM TO SOCIAL OR PUBLIC GROUPS. (The full list is in these two LRH EDs.)

2. DISSEM TO THE INDIVIDUAL WITH PROBLEMS NOT THE GROUP OR INDIVIDUAL WHO HAVE SOLUTIONS.

PUBLIC AND SOCIAL GROUPS

Public and social groups, from governments to garden clubs, are organized around some agreed-upon solution and were organized because of and to support some fixed solution such as an ideology or a quick buck or a dominance system.

In such a case you are talking to and at an *idée fixe*. It fears anything that might shake its pet aberration.

Indeed, by addressing it directly as a group by a lecture or a mailing you can solidify the consistent antagonism it feels to anything different to its ideas.

Such groups are also a mutual protection society and their members are to a greater or lesser degree personally defensive but collectively aggressive.

Such groups can usually be neglected in matters of dissemination.

They can be approached only within the framework of cooperation when your aims and theirs seem to or can be made to seem to have something in common and only then if you don't try to "sell your wares" to their members. Even a mutual support idea is a touchy matter and has to be very smoothly handled with top PRO.

To a nation at war, for example, everyone not of that nation is a potential enemy and allies are traditionally barely tolerated and suspiciously so at that.

In a "dog-eat-dog" world, such as man is continually told it is, political and social groups have other foundations than a simple wish to assemble or to make things go right.

Thus a mailing list to a governmental, public, social or professional (nonscientific) group is a WASTE OF TIME and can even do harm. This includes any list of individual members of such groups.

They are not there to make a better society, but to have mutual support for some special idea.

We also long ago learned this cynical axiom: "Groups tend to perpetuate the conditions which they are formed to combat." For example, the Beers groups "to bring legal rights and better treatment to the insane" in 1905, advocates as the "mental health" associations of today, which advocate easy seizure and mayhem while still talking about the late Clifford Beers.

Nobody ever heard of polio until it really got antipolio groups.

Deficient in technology to accomplish their ends and dependent at last on the evil they fight to gain support, the group types listed in LRH ED 14 Int, 1 Aug. 68, are found to fix into a solidified idea that brooks no challenge and which imagines anything else *is* a challenge to it.

So don't waste your time except to fix up an alliance and do that only by discussing points of close agreement in purposes not your own subject.

Exceptions will of course be found.

We sent these mailings to check reform codes. We also found it is worthless to dissem to specialized groups.

We also had this datum earlier. A mission based its whole dissem program on approaching and working with specialized groups and went broke promptly.

Groups can also be unpopular in the extreme as witness certain governments. A certain percentage of the poor response told us to attack the American Medical Association and American Psychiatric Association.

THE INDIVIDUAL

The bulk of the individuals on the planet are "unaligned." This is about 92 percent of the population! This figure is taken from countries involved in heavy insurgent attack.

The commotion of "mobs" one reads about in the press, the "opinion of the people" are usually propaganda nonsense gotten up by specialized groups who are less than a thousandth of the population. They are staged and pushed by newspapers who are solvent only on funds that make them pro- or anti-. Newspapers represent so little of "public opinion" they are seldom generally liked. Supported by specialized groups they pretend to "public opinion" in order to increase the impact of the message of special interests. Billionaire Nelson Rockefeller, favorite son of US big interests, mud-balled on a flying tour throughout Latin America, almost everywhere he stopped got the most placid US and the most violent European press on the same incidents one ever read. Neither one represented any "public opinion."

In the hard reality of insurgency campaigns when propaganda is at highest intensity, when all the chips are down 92 percent just aren't on either side. They simply wait to see who is winning if they have any ideas at all.

This tends to say 92 percent of a population do not belong to groups. The figure is not too far wrong.

This gives us a new insight into the one out of twenty in any purposeless gathering who suddenly objects to Scientology.

YOU COULD HAVE HIM IF YOU INVARIABLY ASKED "ALL RIGHT, WHAT IS YOUR SOLUTION TO THINGS?"

You would probably get a harangue about fascism or legal rights. Lord knows exactly what you'd get but it would be the *idée fixe* of some specialized group.

Newspaper reporters are usually serving, by direct orders, specialized groups. "The vicious Catholics and the heroic Protestants." "The underhanded Left and the holy Right."

By the natural selection of firing any reporter who isn't a devoted advocate of the special interest group behind the publisher, any disaffected newspaperman isn't on that paper long. Freedom of the press as it is laughingly called does not extend to freedom of reporters! The unaligned reporter is left to take up other lines of work. The closest you can come is to control the publisher or to indicate alliance with the paper's interests to the reporter.

The Special Interest Individual is a member of a group united by an *idée fixe*. He has a SOLUTION. Any other idea he considers a potential enemy of his solution. Thus his comm will occur, hidden or exposed, to forward special interests. When the comm is hidden it becomes disinterested or vicious as it is over the top of the withhold of his alignment with a special interest.

Comm is possible only by discovering his special interest and indicating alliance with it. The comm then will probably be a bit grudging but it occurs.

However, this leaves us about 92 percent of the world's population with whom comm is possible, especially on a personal basis.

In this 92 percent one has a uniform factor, a common denominator of personal survival.

The special interest fellow would comm only on his third dynamic special interest and sometimes even commit suicide on the first dynamic to defend that special interest.

But 92 percent have some idea of personal survival and therefore can individually comm about things that would increase their survival potential.

SUMMARY

We can repeat "Disseminate to those who have problems not those who have solutions."

Thus there is little point in disseminating to a university as it has solutions for everything. There is every point in disseminating to a student as he has the problems. But even here many students also have *the* solution — to get a degree to magic carpet them to life and the buck or are in the process of espousing special interest groups.

So one can say one can usually disseminate to a student who has PROBLEMS.

There would be no point in disseminating to a police force. There would be every point in disseminating to a policeman who has problems.

There would be no point in disseminating to the War Ministry but every point in disseminating to soldiers who have PROBLEMS.

The only "risk" one runs is some special interest group believing their prey are being stolen from them.

One can easily make the error of believing special groups are interested in general betterment.

With Earth as it is, "prey" is a better word than "patient" to describe a psychiatrist's special interest attitude. And "prey" is a better word than "citizen" to match the thoughts of some government agencies.

Now it so happens that people don't like to be "prey" and they resent the large majority of special interest groups the moment they discover they are such.

It opens the door widely to dissemination to get a clean look at the fact that upwards of 92 percent of a population are not on the side of anyone. The large majority of these have problems.

Thus dissemination can occur.

We who are simply trying to make individuals better and so improve the society, without any other axes to grind or drums to beat, thus have the majority potentially on our side.

HCO POLICY LETTER OF 11 DECEMBER 1969R
ISSUE I
REVISED 16 SEPTEMBER 1988

REMIMEO
PES HAT
DIR PUBLIC RELATIONS

(IMPORTANT ORG BOARD CHANGE)

APPEARANCES IN PUBLIC DIVS

The appearance of the org and staff is transferred out of Department 1 which becomes the DEPARTMENT OF ROUTING AND PERSONNEL and may still be called RAP.

In accordance with HCO PL 5 June 83 VI, CLASS IV ORGS PUBLIC DIVISIONS ORGANIZING BOARD, APPEARANCES comes under the Department of Public Relations, Div 6C, Dept 18A, Org Appearances Section.

The Public Exec Sec therefore is directly responsible for the appearance of the org, its staff, its literature and publications so far as appearance and acceptability go.

Appearances never worked under Dept 1. "Image" is actually a PRO function and it is of vital interest to the Public Exec Sec as otherwise his promotion may be dulled or rendered null. Appearance can even cause him much trouble.

The IMAGE of an org and its staff and its literature and publications actually is a form of projection into the public.

The reason it is in Dept 18A is that this is the first department of the Field Control Division. Also it is something which has to be fitted into the values of the population where the org is located. They have definite ethnic ideas of what an org would look like, what a staff would dress like, what the literature should look like if any of these had a command position.

It is always easy when one has millions to spend to make a commanding image. The trick is to make it without its costing more than one can afford.

One has to make the money before one makes the full image.

There is much one can do — and has to do — at no financial cost or at a low price.

One can paint up a place with volunteer help for the cost of rented machines and materials.

Staff individual areas of responsibility ("cleaning stations") should be assigned via the HCO ES so that all areas of an org are covered. If one has a cleaning service this is still necessary as there is such a thing as litter. Newspapers, magazines, typewriters, machines — no cleaning service handles these. That is staff action because it's staff use.

Where one does not buy the staff its clothing one can still insist on clean hands, fingernails and cut hair, bathed bodies and brushed teeth, polished shoes and so on. It's poor advertising indeed when a staff member is dirty and unkempt.

When one has money and an ethnic survey has determined what the population thinks a professional looks like, one can buy the staff clothes that forward a highly professional image to create public respect and confidence. Remember in this survey as in all ethnic surveys, one does not copy professionals in the society as they *haven't* done a survey. One is interested in looking like what the public thinks a professional looks like. This is moderated of course by what the staff will then be proud to look like.

Reception and staff manners are part of appearances.

An auditor's bad breath or body odor can cost you quite a lot of gained ground. So this is part of it also.

A noisy atmosphere near auditing rooms or in Reception, radios playing, staff chattering can spoil an image.

Children flying about and babies' nappies hanging are about as far as you can get from a professional image. Do all right for the Congo maybe but even there I can't imagine a juju being taken very seriously in a hut so equipped.

The way to spoil an org image is of course to subdue or kill what successful Scientology orgs have always been noted for — a happy, friendly, busy atmosphere. So the use of heavy ethics to produce image compliance is murderous. Pride is the primary reason for good appearance.

So staff cooperation and enthusiasm for the project is worth thousands of conditions seeking to force them to work for an image. Modern schools are so backward they don't teach personal appearance, manners, cleanliness. And a lot of staff just don't know any better and have to be taught what they weren't taught in schools.

Fighting to obtain and improve a suitable image is inevitably quite a task. If the org had lots of money it could buy its image. But without lots of money the image has to be gradually built. Cleanliness and neatness are the primary building blocks to respect in most societies.

An org without money has to have an image to make money but an image costs money and the org hasn't any. That's a typical problem. "We should have a building like the new Life Insurance Skyscraper" leaves the problem unsolved. There is a gradient between. You can pay so much rent you just work for the landlord or the bank. Or the rent is so high you can't afford enough space to earn the rent. Problems like that crop up.

If the tech/admin ratio of 2 admin to 1 tech is kept and even brought toward 1 to 1, and if promotion is excellent and effective and tech service and org service is good, it is easy to lay aside enough to earn new quarters. So the image can be improved.

Similarly, literature quality is desirably very high. But its cost can rise to a point where it makes promotion too costly to be engaged upon. That has happened several times to orgs where they went overboard on too posh literature.

Quality of presentation of tape recordings — sound quality — definitely comes under Dept 18A now.

The org image is in the care of the PES. I trust he does well with it.

PR SERIES 1

LIABILITIES OF PR

PR = public relations, a technique of communication of ideas.

A casual investigation of the activities and effects of "PR" as practiced in the first seventy years of the twentieth century gives one ample data to regard "PR" with caution.

The subject is one which can be said to be dangerous in its incomplete stage of development or in the hands of inexpert or unscrupulous people.

Thus we have three major liabilities in PR usage:

1. It is an incomplete technology as developed and used up to 1970.

    a. The human mind was not a known field.

    b. Any early technology of the human mind was perverted by the University of Leipzig studies and animal fixations of a Prof. Wundt in 1879 who declared man a soulless animal subject only to stimulus-response mechanisms and without determinism.

    c. Further perversions entered upon the scene in the 1894 libido theory of Sigmund Freud attributing all reactions and behavior to the sex urge.

PR is essentially a matter of reaching minds. Therefore the above three factors have given PR strange elements and bedfellows which have curtailed its development as a subject.

Naturally you'd have to know something of the mind to handle PR. Yet if a PR man is operating not only without knowledge of the mind but with a corrupt idea of it (as in Wundt or Freud), his use of PR technique can spread a fantastic amount of aberration into the society and can result in an aberrated society. PR men operating in the "mass media" (press, radio, television, magazines and in lobbying parliaments) push strange mental ideas.

2. Inexpert PR men can make a gruesome mess out of the subject and the society.

    a. Working with an incompletely developed subject, yet using the powerful communication systems of the society, it is not only not unusual for the work of a PR to recoil on his own employers but is usual to bring them into decay.

3. PR lends itself to the use of unscrupulous persons and cliques.

    a. The extremists such as the Nazis and Stalinists saw in PR techniques the means of subjugating their own people, perpetrating horrors and bringing their opponents into disrepute. Such extremist groups were enormously assisted by PR techniques.

    b. Using PR technique to bring about disrepute of their imagined enemies, unscrupulous persons have brought about an atmosphere of war, crime and insanity on the planet.

These are of course harsh words. But it is better to know all sides of a subject.

PR practitioners of course spread PR about PR. But the use of black PR far exceeds its other uses in this year of 1970. Yet teachers of PR in the smoky cloisters (smoke from marijuana) give us only the Sunday school version. According to them, *PR* is a nicey-nicey way *of bringing good works to public notice* and that is their favorite definition. In actual fact ten times as much PR work is done in getting rid of someone or something imagined to be dangerous to the PR's employer.

Bribing newspapermen and "freelance writers" to write horrible lies about a competitor, bribing or lying to congressmen or ministers or members of Parliament to get a law passed to enable a fast buck to be made and countering the ploys of the other firm's PR men are the common duties of a working public relations employee.

This scene doesn't seem to be quite the same as PR as represented in the ivory skulls of its professors.

It's a PR world.

When you read the papers, books and watch the TV of the twentieth century, it's not a very nice world. Well, that's PR at work.

The far right PRs against the far left. And in between, more moderate groups PR both.

Every government department in England has a PR office. The beginning of the decline of the British Empire and the first British government "information office" are of similar date.

The unsavory history of PR, its use to perpetuate questionable interests and cause needless and murderous quarrels must be confronted as part of the study of PR.

It is not for no reason that PR men are often of pitiful morals and degenerate character.

The countless trillions of volts of radio and TV, the rivers of newsprint and pages tearing through presses, pour fantastic lies into the overwhelmed population of Earth.

The prevailing tone of dismay and contempt across the world is stimulated and kept alive by PRs.

So disabuse yourself of any idea of a pleasant scene in the field of PR.

Even if you are engaged in the promotion of the most worthwhile objects pushed by the most altruistic leader, PR work is done cheek by jowl with some pretty questionable characters whose objects are far from worthwhile and whose masters are about as altruistic as a rattlesnake.

Thus PR easily becomes a cynical activity. The PR deeds of the bad hats throw the field into disrepute and throw the whole world into a whirlpool of hate and decay.

So in entering or studying this field, do not walk into it like a wide-eyed virgin making an incautious visit to a military brothel.

There is no reason to be disillusioned if one does not start out with illusions.

PR is a partially developed technique of creating states of mind in different types of audiences or publics.

PR can be used or abused.

Thus before proceeding any further with the subject, it was necessary to restudy the subject and find out what was wrong with it, add it to the subject and thus make it less dangerous to use.

The liabilities of PR, as taught and used before 1970 were:

A. It inevitably recoiled in greater or lesser degree to the harm of its user.

B. It had long repute as a carelessly or badly used subject, full of failures.

C. It is normally used into the teeth of competitive PR.

Unless these objections could be nullified or new discoveries and developments could be accomplished, the basic techniques of PR were about as safe as a cocked Spanish pistol — ready to blow up its user long before it hit anyone else.

This is what has been done with PR in our hands:

1. Its more dangerous points have been located.

NAVIGATE
FIRST PAGE
SEARCH
FIND
AGAIN
EXIT
CONTENTS
ORG BOARDS
INDEX

2. A *full* study of its texts is required.

3. It is designed now for use that is beneficial as well as offensive and defensive.

Thus the standard texts of PR have to be studied and studied well. And they must be studied WITH THE ADDITIONAL DEVELOPMENTS KNOWN AND GIVEN HIGH IMPORTANCE.

Only then is it safe to use PR techniques. Otherwise PR activities are almost a complete liability and will lead to trouble.

In this series we will bring PR up-to-date from the liabilities which exist in its purely PR college textbook practice.

PR SERIES 2

THE MISSING INGREDIENT

The primary corrective discovery about PR has to do with the ARC triangle of Scientology.

This triangle is affinity — reality — communication. If one corner (say A) is raised, the other two will rise. If one corner is lowered, the other two are as well.

Thus with high affinity, one also has a high reality and a high communication. With a low affinity one has also a low reality and a low communication.

With a high or low R one has a high or low A and C.

And so it goes. The whole triangle rises and lowers as one piece. One cannot have a low R and a high A and C.

PR is supposed to be a *communication* technique. It communicates ideas. Suppose one were to try to communicate an out-the-bottom R. In such a case the communication would possibly at first reach, but then it would recoil due to its R.

This is of course an advance in the mental technology of Scientology. It was not available to early pioneers of PR. So they talked (and still talk) mainly lies.

Older PR practitioners *preferred* lies. They used circus exaggeration or black propaganda. They sought to startle or intrigue and the easiest way to do it was with exclamation point "facts" which were in fact lies.

"Mental health" PRs dreamed up out of whole cloth the "statistics" of the insane. "Nine out of every fifteen Englishmen will go insane at some period of their lives" is a complete lie. Streams of such false statistics gush from PR lobbyists to get a quick pound from Parliament.

The stock in trade of PRs, whether hired by Stalin, Hitler, the I Will Arise Society, the US president or the International Bank, has been black, bald-faced lies.

The US president has given two different figures of the percentage of increased government cost per year in two months. His PR man was trying to influence Congress.

The "Backfire 8" as the "Car of the Century" and the parachute exhibition "record delayed drop" and the ambassador's press conference on "Middle East Aims" are all PR functions — and salted throughout with lies.

You pick up a newspaper or listen in the street and you see PR-PR-PR — all lies.

A battle cruiser makes a "goodwill visit" to a town it is only equipped to crush and you have more lies.

The tremendous power of newspapers, magazines, radio, TV and modern "mass media" communication is guided by the PRs of special interests and they guide with lies.

Thus PR is corrupted to "a technique of lying convincingly."

It makes a cynical world. It has smashed idealism, patriotism and morality.

Why?

When an enforced communication channel carries only lies then the affinity caves in and you get hate. For the *R* is corrupted.

PR, dedicated to a false reality of lies, then becomes low A, low C and recoils on the user.

So the first lesson we can learn that enables us to use PR safely is to KEEP A HIGH R.

The more lies you use in PR the more likely it is that the PR will recoil.

Thus the law:

NEVER USE LIES IN PR.

The trouble with PR then was its lack of *reality*. A lie of course is a false reality.

The trouble with PR was R!

In getting out a press release on a new can opener, that opens cans easily and you want to say "A child could use it," find out if it's a fact. Give one to a child and have him open a can. So it's true. So use the line and say what child. Don't call it the "Can Opener of the Century." It won't communicate.

Just because radios, TVs and press pour out does not mean they communicate. Communication implies that somebody is reached.

Don't tell a lie to city officials when the truth is just as easy to tell. Why go to all the work of dreaming up a lie? If you do, it will weaken you if it is found out that it is a lie. Now you *do* have a PR problem with the "official public."

Any lie will either blunt the C (communication) or end the C off one day with revulsion.

Handling truth is a touchy business also. You don't have to tell everything you know — that would jam the comm line too. Tell an *acceptable truth*.

Agreement with one's message is what PR is seeking to achieve. Thus the message must compare to the personal experience of the audience.

So PR becomes the technique of communicating an acceptable truth — and which will attain the desirable result.

If there's no chance of obtaining a desirable result and the truth would injure, then talk about something else.

PR is employed to obtain a result desired by the PR and his group.

Or it is employed to cancel out the undesirable PR of others.

Thus there is offensive and defensive PR.

In defending against hostile PR, once more it is the *R* that counts. Sun Tzu in his book about warfare gives several types of agent. One of these is the "dead agent" because he tells lies to the enemy and when they find out they will kill him.

Hostile (or counter) PR is usually the usual fabric of lies.

If one finds out the lies being told and documents just one as being false, he has made counter-PR recoil. His hearer will never believe him again. He's dead.

In the war between psychiatric hostile PR and the truth of Scientology, the "dead agent" caper has a field day. Psychiatric PR has been lying for twenty years. Documented, the fact that these lies are lies is *killing off psychiatry*.

You understand, it's not one PR's word against another's. It's one PR's documents against the other PR's lies! That is correct defensive PR.

So you see that using out-R PR can be very dangerous.

If one is trying to PR an abuse into decay (a dangerous activity in itself), he obtains the desirable result by documenting TRUTH. But using the "dead agent" caper is quite enough almost always.

The use of *R* not only involves truth, it involves acceptable truth and that involves the fixed opinions of another or others and their experience. All this is contained in the subject of REALITY.

What is the R of another or others?

This involves SURVEYS.

Then you know what truth he or they will accept.

Imagination in PR is not limited at all. It takes lots of imagination. But the imagination should be devoted to how the truth is made acceptable to the R of others and how the comm is delivered.

A totally imaginary statement or story is quite useful so long as it is known to be imaginary and not passed off as truth.

In a PR world, truth is the almost unknown commodity. This world is full of the "noise" of many lies, many babbles, many old fixations and hates.

But truth has comm value. All the lies will dead-end someday.

A (affinity) supports the R and C.

Therefore PR which seeks to incite hate will not have the C value of a message that carries actual affinity.

But affinity can also be falsified and in the PR world too often is.

A person who is sane has a high ARC value.

So the PR who is sane has a high potential. And those who have corrupted their A, R and C into a hole, wind up on the bottle or beating their dogs or cynical beyond belief.

Serving mad masters, a PR hasn't much chance.

So there *is* a technique known as public relations. And it has the high liability of abuse through lies and the degrade of its practitioner.

But if one strictly attends to the values of truth and affinity, he will be able to communicate and can stand up to the strain.

Knowing this, PR becomes a far more useful and mature subject.

PR SERIES 3

WRONG PUBLICS

What is a "PUBLIC"?

One hears "*the* public," a star says "*my* public." You look in the dictionary and you find "public" means an organized or general body of people.

There is a specialized definition of the word "PUBLIC" which is not in the dictionary but which is used in the field of public relations. "PUBLIC" is a professional term to PR people. It doesn't mean the mob or the masses. It means "a TYPE OF AUDIENCE."

The broad population to PR professionals is divided up into separate *publics*. Possibly the early birds in PR should have begun to use "audiences" back in 1911. But they didn't. They used the word "publics" to mean different types of audiences for their communications.

So you won't find this in the dictionaries as a PR professional term. But you sure better wrap your wits and tongue around this term for USE. Otherwise you'll make more PR errors than can easily be computered.

WRONG PUBLIC sums up about 99 percent of the errors in PR activities and adds up to the majority reason for PR failures.

So what's a "public"?

In PRese (PR slang) use "public" along with another word always. There is no single word form for "public" in PR. A PR never says THE public.

There is the "community public," meaning people in the town not personally grouped into any other special public. There is the "employee public," meaning the people who work for the firm. There's the "shareholder public," meaning the birds who own shares in the PR's company. There's the "teenage public," meaning the under-twenty people. There's the "doctor public," meaning the MD audience the PR is trying to reach.

There are hundreds of different types of publics.

An interest in common or a professional or caste characteristic in common — some similarity amongst a special group — determines the type of public or audience.

The PR needs this grouping as he can expect each different type of public to have different interests. Therefore his promotion to them must be designed especially for each type of public.

In the PR world there aren't kids — there is a "child public." There aren't teenagers — there's a "teenage public." There aren't elderly people — there's an "elderly public."

The PR man does not think in huge masses. He thinks in group types within the masses.

PR is an activity concerned with *presentation* and *audience*. Even when he writes a news release, he "slants" it for a publication that reaches a type of audience and he writes it *for* that audience (modified by editorial idiosyncrasies).

A PR *surveys* in terms of special publics. Then he presents his material so as to influence *that* particular public.

He doesn't offer stories about wheelchairs to the teenage public or Mickey Mouse prizes to the elderly public. If he is a good PR man.

All releases should be designed to reach a special public.

When you mix it up you fail.

When you get it straight and survey it you succeed.

The "police public" is not going to buy the glories of hash. The "criminal public" isn't going to go into raptures over the "heroes in blue."

All expert PR is aimed at a specific, carefully surveyed, special audience called a "_____ public."

When you know that you can grasp the subject of PR.

When you can use it expertly you are a pro PR!

To give some examples of wrong publics, Ron's Journal was designed for org staffs as an intimate chat with staff members to let them in on what's going on and what we're planning so that staffs could be informative to the Scientology public. It was a "staff public" medium of communication.

Somebody (in NY) broke the rules, played it to the Scientology public. Then somebody else figured it was a substitute for a congress and dropped congresses.

The exact end result was to cut totally my comm line to org staffs. The other day I heard how staffs missed hearing from me.

If my line to staffs in orgs is going to be played to PE attendees, that's it. Wrong public. No comm line to staffs.

I do a briefing of SO members on Flag, some dimwit uses it to play to Public Div public. Wrong public. So that line is cut.

Clear News publishes Treason orders on students to promote an AO! Wrong public.

Clear News is used for an FSM newsletter. Wrong public.

Clearing Course fliers go to new bookbuyers. Wrong public.

Letter Registrars write to people on a mailing list sent in by a mail-order house. Wrong public.

A conclusion someone not knowledgeable in PR technique could reach would be "promotion doesn't work."

Promotion never works on wrong publics.

THE SYSTEM

The PR has to figure out his precise publics. There may be several distinct types.

Then he has to survey and look over the reactions of each different type.

He then plans and designs his communication and offerings for each one.

An orderly org has each different public categorized and labeled in Address.

Then the PR sends the right message to the right public in each case. There may be a dozen different messages if there are a dozen different publics. Each one is right for that public.

The PR is after a result, a call-in, a reply, a response.

The right message in the right form to the right public gets the result.

A wrong message to the wrong public simply costs lots of money and gets no result.

Even if a PR is engaged in "molding public opinion," it still requires a different message to each different public.

PERSONNEL HATS
PR CHECKSHEETS

PERSONNEL SERIES 11
PR SERIES 4

THE PR PERSONALITY

A public relations personnel has to be spot on in:

a. Confronting,

b. Organizing,

c. Working.

CONFRONT

In confronting, a shy or retiring PR is not about to handle suppressive persons or situations. A PR must be able to stand up to and handle the more wild situations easily and with composure. When he does not, his confront blows and any sense of presentation or organization would go up in smoke. A PTS (potential trouble source) person or one who roller-coasters casewise or one who tends to retreat has no business in PR. His connections that make him PTS and his case would have to be handled fully before he could make good on PR lines.

ORGANIZE

In organizing, a PR has to be able not only to organize something well but to organize it faultlessly in a flash.

Every action a PR takes concerns groups and therefore has to be organized down to the finest detail; otherwise it will just be a mob scene and a very bad presentation.

A PR who can confront, can "think on his feet" and grasp and handle situations rapidly and who can organize in a flash will succeed as a PR.

WORK

The last essential ingredient of a PR is the ability to WORK.

When appointing people to PR training, the person's *work record* is very, very important.

The ability to address letters, push around files, haul furniture into place, handle towering stacks of admin in nothing flat are all PR requisites.

To be able to tear out to Poughkeepsie before lunch and set up the baby contest and build a scene for a press conference on catfish before two and get dressed, meet the governor by six is WORK. It takes sweat and push and energy.

A PR should be able to get out a trade paper in hours where an "editor" might take weeks.

The ability to work must be established in a potential PR before wasting any training time, as a PR who can't work fails every time.

DELUSORY REQUIREMENTS

People *think* a PR must be charming, brilliant, able to inspire, etc., etc.

These are fine if they exist. But they are actually secondary qualities in a PR.

Lack of the (a), (b), (c) qualities is why you see PRs begin to hit the bottle, get sick, fail.

If a PR is *also* charming, brilliant, able to inspire, he is a real winner. Possibly one is born with all these qualities every few generations.

Personnel in appointing and training PR must look for the wish to be a PR and (a), (b) and (c).

And anyone taking up PR who does so to escape hard work will fail as it IS hard work.

A real top PR wants to be one, has the abilities of (a), (b) and (c) and is trained hard and well in the subject. Then you have a real stat raiser, a real winner, a real empire builder.

REMIMEO

PR SERIES 5

PR DEFINITION

The definition of public relations is very precise. The definition is not given sufficient importance in the texts and it is way down in the middle of most books. It is what the subject is all about and without it the subject doesn't make sense. (And doesn't make sense to many PR pros either.)

It took me a whole hour to clear this definition and misunderstoods of it and related words on a PR student. It should be meter cleared. Every word in it should be clay tabled.

THE DUTY AND PURPOSE OF A PUBLIC RELATIONS MAN IS:

THE INTERPRETATION OF TOP MANAGEMENT POLICY TO THE DIFFERENT PUBLICS OF THE COMPANY — TO ADVISE TOP MANAGEMENT SO THAT POLICY IF LACKING CAN BE SET — TO MAKE THE COMPANY, ITS ACTIONS OR PRODUCTS KNOWN, ACCEPTED AND UNDERSTOOD BY THE DIFFERENT PUBLICS — AND TO ASSIST THE COMPANY TO EXIST IN A FAVORABLE OPERATING CLIMATE SO THAT IT CAN EXPAND, PROSPER AND BE VIABLE.

If a PR man understands all that so he can apply it rapidly and perfectly, he will *then* be in a position to know what PR procedures are and do his job.

REMIMEO

PR SERIES 6

OPINION LEADERS

An "opinion leader" is that being to whom others look for interpretation of publicity or events. Through wisdom, proximity to data sources, personality or other factors including popularity itself, certain members of the group, company, community or nation are looked to by others for evaluation.

In the teething days of public relations, George Creel, who conducted the massive Liberty Loan drives for the US government considered that it was enough to batter avalanches of publicity down on the heads of the "general public." Given enough money, enough media of communication and no real opposition this proved successful enough.

But as time unreeled, some unsung PR man recognized the fact that the "general" public was made up of smaller groups. Churches, social clubs, factories, and thousands of other large or small groupings of the population were what made up the "general" public.

Each of these groups had its own "opinion leader" and within each group there were smaller groups who each in turn had its own opinion leader.

"To whom do they listen?" "Whose opinion do they accept?" "Whom do they trust?" "On whom do they depend?" are the questions, which, answered, identify the opinion leader of the group, large or small.

Further, the opinion leader of a very large group, in turn, is interpreted by the opinion leaders of the smaller units which go to make up the larger group.

As an example, government spokesman X puts out Bulletin A on the radio and TV and into the press. He is NOT talking to masses of people. He is in reality talking to opinion leaders. On a crucial question there will not be a reaction to X until the listeners have heard what their opinion leaders have to say about Bulletin A.

If there have been other issuances like Bulletin A, the opinion leaders will have voiced their own opinions. Their groups will then know the attitude. In this case Bulletin A will receive an apparent "general public" reaction. In short, the opinion about Bulletin A's will have been preformed by the opinion leaders. This makes it look like there is mass public opinion without opinion leaders.

One of the great dangers of PR practice comes from not really knowing the subject well enough or in twisting it or in losing bits of it.

Having discovered the principle that "opinion leaders" form public opinion not the "general" public, many PR people forgot it, or didn't give it enough importance or even in some cases chose to be willfully destructive of their employers.

It should be very obvious that if general public reaction to an event is dependent upon the reaction and interpretation of opinion leaders, then a PR action's success depends upon favorably influencing the opinion leaders of that part of the population one is trying to reach and calculating what opinion leaders one can neglect or even offend.

This would be almost mathematical in computation. Spokesman X issuing a Bulletin A that offended 55 percent of the opinion leaders would get, roughly, a 55 percent opposing reaction from the whole public.

Surveys for the identities of opinion leaders would then become a MAJOR activity of PR in any area and for any type of message or event.

Even a rough estimation, which is easily done, would serve better than no thought of it at all.

PR men go for Very Important People. PR wears this out beyond belief. But it is an alter-is. VIPs to PR are only opinion leaders. A government minister is tagged automatically by PR people as a VIP because his car has flags and he *is* a minister. Yet he may be a drunken nephew whose opinion is about as welcome to his colleagues as a hangover. So he may be a VIP but he is not an opinion leader. When he says "blue," his colleagues think "black" and the opinion leaders in the public think "red." The only PR use of this minister would be to get him to embrace and speak up for someone you wanted shot or some cause you wanted opposed!

There is such a situation currently in a man called Goodrich or some such name, head of FDA in Washington. Thirty-two years in that agency, big record. Head of it = VIP. All he has to do is open his mouth and his staff writhes, Congress spits and opinion leaders say no — no — no. So he could only be used to oppose something you wanted popular.

So it's very lazy PR to assume that a "VIP" is worth knowing or using. Sometimes VIPs are also opinion leaders.

Celebrities are more often opinion leaders as they arrive at their role by popular acclaim. But even here one has to operate with good sense. Paul Robeson, the great American singer, was used by communists in the 1930s to popularize their cause. It did not achieve this. Paul Robeson championing his own race probably would have advanced civil rights legislation greatly. The misuse brought anticommunists to believe that all the Negroes would now become a communist fifth column and brought about strong opposition to Negroes and to communists.

The rule that should not be violated is to use an opinion leader only to further an opinion he could have visibly. The equation must add up with all factors of a kind, not a strange factor interjected into the sequence. Like music, you don't introduce a wrong note in the scale if you want harmonious rendition. Robeson (black singer) — opinion leader of blacks — communism. Too odd a sequence. Robeson (black singer) — opinion leader of blacks — black relief. Obvious sequence.

The equation:

Bertrand Russell (British philosopher) — academic opinion leader — communism: caused a strengthening of the communist cause because he was a thought symbol and "anybody was free to think" and "they're always forming odd ideas in the halls of learning." His statement "Better red than dead" was a classic PR caper. It was widely quoted. Helped Russell, of whom few ever would have heard, and possibly helped communism, at least to be talked about, and obviously was picked up by the group in which Russell existed. To the rest of us this may have sounded like naked atomic war threat and warmongering. But it was the proper use of a foreign opinion leader by a large group.

Now if the paragraph above jarred on you in any way or seemed to espouse a strange cause, etc., etc., you will have the reason why PR men cannot always see clearly and objectively. They themselves are too involved in causes and pros and cons to remain pan-determined (viewing or handling all sides).

By permitting prejudice to get in the way of handling opinions a PR man loses control of his subject. He becomes so violently partisan that many of his stable data become blurred or abused.

Thus the subject of opinion leaders can become abandoned. Disagreement with the views of some of them remove not only the opinion leaders but the whole subject of opinion leaders out of use.

While conducting themselves like status-mad prima donnas, seeking to exist mainly by PR techniques, most people in government power positions are remarkably badly served by their PR men and by their own prejudices or jealousies.

Essentially, a person *in* power is not the same person seeking power.

Maintaining power is a different subject than attaining power.

A politician by definition is someone who handles people. Even the word means "people." Thus the subject of "public relations" does a natural closure with government.

Yet the alteration of the subject of PR and its misuse, neglect or abuse by government PR men could be in itself a considerable study.

The vast majority of population unrest stems from the misuse, neglect or abuse of PR technology by governments, even those governments that consider themselves experts.

A politician commonly is boosted to power by opinion leaders. This could be called the "will of the people." Once he has attained power, the garden-variety politician of this age finds himself committed to special interests that have little to do with the "will of the people." Few are the politicians who have the integrity to continue to look to the people — the opinion leaders — who put them there. Thus, now apparently serving other masters they appear to have been false in their earlier pretensions. Not remaining true to their opinion leaders, politicians as a general subject acquires a cynical reputation with the "people."

A Labor leader in England, put into power by opinion leaders, then spends his time in office talking about bankers, banking, deficits and all that mumbo jumbo of

modern government, speaks hostilely about unions, seeks to restrain shop stewards and union bosses, puts on a tax to penalize any company that hires someone and then has the dullness to wonder why he took a beating at the polls eventually and lost. He turned on his opinion leaders. Where were his vaunted PR experts?

The US government routinely achieves the impossible of turning the bulk of the population against it on most issues. Its politicians are regularly forced to maintain their positions by huge avalanches of public funds.

Hiring more and more police and spies for more and more government police agencies, the government is becoming less and less popular. "Patriotism" and "idealism" are now considered dirty words.

Why? How did this get this bad?

Well, one reason is that government PR is continually recoiling on the government. Either they don't hire good PR men or if they do, they don't take their advice. Or their PR men don't know their subject or aren't permitted to practice it.

The general unrest and unpopularity is largely traceable to a violent disregard of the subject of *opinion leaders*.

Attaining power is done usually by the consent of or with the help of the opinion leaders. Arrival in a position of power too often causes the person to shift the basis of his operation. He is now associating with different people in a power strata. It would require quite an effort of will to not be seduced. Having achieved power by opinion leaders, the person may forget them and seek to maintain power by other means or by force. This is essentially a violation of the Power Formula which indicates one should not disconnect. By disconnecting from the previous opinion leaders, the person begins his own demise.

This is terribly easy to do in the case of government. It is so easy for a government to use FORCE that a disregard of previous opinion leaders can occur.

Money power is usually available to persons who rise to positions of leadership and can be, like force, a substitute.

Thus a truly suborned leader would desert "opinion leader" as a basis of power and begin to use FORCE and MONEY to hold his position.

But when one assumes a position of power, regard for opinion leaders should *broaden,* not be dropped.

The astute leader on his way up may tread heavily on the opinion leaders of the opposition. This has its benefits in reinforcing the favor of opinion leaders for him. But it also has its liabilities for, now in power, he may have serious enemies who are all the more perturbed now that they too have him as a leader.

Few politicians — indeed few men who move into any kind of power — ever satisfactorily solve this problem. The *very* able ones do solve it and become far more powerful as a result since they do not violate the Power Formula.

Not only does the brilliant leader refuse to disconnect from the opinion leaders who put him there through "public approval," he also connects with the previously

opposing opinion leaders. If truly magnificent he gains the good opinion of former hostile opinion leaders without decreasing the goodwill of the opinion leaders who put him there. This actually defines the difference between a second-rate politician and a real statesman. The genius required to arrive at such solutions cannot be underestimated, but the formula of achieving it is elementary PR.

The leader of the "blues" (supported of course by the opinion leaders of the "blues") rises to power in the teeth of "green" opposition. Now in power, he has sway over both the blues and the greens. The blue's opinion is that this should signal a panorama of dead greens. But unless this rule is to be just one long bloodbath it is now necessary to cool off tempers all around, preserve blue support and *win* green support. That is an elementary equation.

Attilas and Huns and Genghis Khans solved this by simply murdering all imagined hostile elements. They may be known in history but politically they built nothing that endured. Even the pyramids of skulls vanished.

Men like Hitler went so far in reverse in handling this problem as to finally slaughter even their adherents.

In the general field of human activities every different or specialized group can be considered a political unit. It elects with a wide variety of formalities, or lack of them, its leaders, and when different agencies than themselves elect them (inheritance, appointments from without), the group at least elects its opinion leaders if only by listening.

And people strive to *be* opinion leaders and also back down or otherwise react when someone else is so "elected."

So being an opinion leader involves the responsibility of maintaining the position by remaining well informed or personable or whatever else seems to be required.

One has to decide in some degree what he is an opinion leader for or against or at least about. And one has to set a zone or have one set for him in which he operates.

A usual example is the family. Often someone in it is the opinion leader. It is not necessarily the one with the money or the force. Where one member or clique has the money or force and uses these and the opinion leader is someone else, strife and domestic upset may result.

All the children may look to an aunt for their styles, thoughts and approval. Where this runs counter to the money-force persons, somebody is going to have a broken home or a horrible old age.

Such is human prejudice — or ignorance — that the money-force persons almost never dream of winning the support of the opinion leader aunt by sound but popular policy based on consultation.

The right answer of course is for the money-force power to operate in consultation with the opinion leader.

This is true all the way on up to government-sized groups.

Money-force may bribe and break necks but it really never does become the leader in the absence of the approval of a majority of opinion leaders.

Prosperity and an easy rule depend utterly upon the cooperation of opinion leaders.

The US government in the last few decades has seemed obsessed with the antagonizing or destruction of opinion leaders.

Using the broad mass approach long since found faulty in PR activities, the US government has lately sought to reach the "public" without that annoying step of reaching and getting the approval of opinion leaders.

Instead, an army of spies from every agency (according to the Committee of Senator Ervin), descend upon any and every popular leader, hound him, annoy him, discredit him. Even managers of businesses are so plagued by government they can hardly do their work. This is also true of England and other countries.

The unrest in the United States and some other countries is traceable directly to this fantastic omission in their PR technical expertise. They not only do not seek the favor of opinion leaders, they actively harass and seek to destroy them.

In return the opinion leaders feel endangered and have and state opinions accordingly. The power of the government drops back on money and force only. Governmental survival is thus greatly impaired.

The so-called "mass news media," by which is meant newspapers, TV, radio and magazines, has the fault built into its title. It cannot and never will reach any masses directly. It reaches only through opinion leaders. It has to quote this one and that one which it fancies as an opinion leader. But it never finds out WHO the opinion leaders are.

Newspaper editorials are a direct effort to force opinion. They quote the opinions of other papers just as though these were opinion leaders.

They believe they "mold public opinion" but PR men long since have given up this idea and even greet it with raucous laughter.

Newspapers have ceased to wonder about their rapid demise. They are getting fewer fast. They thought it was radio. Then TV. It wasn't.

Willy Hearst's 1890 yellow journalism and scandalmongering began to dig the grave of the newspaper that many decades ago.

Hear this: While seeking to control public opinion, newspapers began to strike viciously at opinion leaders. Name him, sooner or later any really important opinion leader in the area would be hit with scandal. It happened so often that opinion leaders automatically began to say, "Don't believe the newspapers."

The day of the newspaper is dead. The not mourned *London Daily Mail* hit one too many opinion leaders one too many times. And nobody believed it anymore and nobody bought it. And it folded.

So government or newspaper or church or hockey club, the same rule applies. The goodwill of the opinion leaders is necessary for survival. *Not* the good opinion of the masses! Since that cannot be reached.

The Russian state talks down about individualism. The "cult of the individual" is a bad thing.

Their internal police is vital to them. They have forgotten that the czar's Okhrana destroyed the czar by destroying every opinion leader amongst the people whom they could seize or slay.

Almost amusingly, the US government has taken over the exact operational pattern of the Okhrana. You can hardly get to your desk through the government forms and mobs of spies urging the staff to commit crimes so they can be arrested or holding out bribes to falsify the tax reports. All one has to do is mention the US government in a pop program and he'll have three army sergeants from G-2 pushing the band out of the way. That's the way it was in pre-1917 Russia just before the opinion leaders decided NO in one final bloodbath.

So as I said earlier in this series, PR is dangerous stuff if one doesn't really know it and if one only applies half of it.

Omitting the opinion leader is bad enough. Seeking to destroy him is far far worse.

Yes, one says, but how about the violent opposition? How about that fellow?

Well, he's a problem. But he *is* an opinion leader.

One has to decide how much of an opinion leader he is.

If you don't handle a would-be opinion leader who is anti but who is NOT an opinion leader, people get cross.

The decision here stems from:

a. Is he talking about actual abuses? or

b. Is he just lying?

In either case one has certain courses of action. If the abuses are actual, work to remedy them. If he is just lying, lay out the truth. If he really isn't an opinion leader, ignore him.

But one can only interfere with him or remove him if many, many are getting cross because you don't. But that's a risky business.

As a rule, only that dissident person should be removed who is speaking in your name and on your lines and using your power to do you down. And then he can only be removed off your lines as you are under no obligation to finance or empower your own opposition. That's suicide. He is not an opinion leader but a traitor for he owes his power to you.

Usually anti-opinion leaders are *made by neglect.*

PR-wise, one has to catch them early and handle.

Abuses by those in charge are never put right by force. They are only worsened.

Perhaps there is no excuse whatever to use force to enforce an opinion. Wars are notorious for failing to solve. You can always find a point years or decades before the war when a point existed that PR and cooperative rule could have solved.

PR imperfectly known or unknown as a subject leads to big trouble.

PR is powerless when it doesn't know.

PR loses when it neglects.

Early enough, PR alone does it.

Later, PR with concessions is needed.

Then PR is out and only force is thought to serve.

This would be a DETERIORATING SITUATION.

The longer PR takes to catch it up, the more imminent loss or force becomes.

From this, technically adept PR could be seen to have too limited a role in the affairs of nations or groups.

The way to attain a more dominant role with PR is first to know it well, next, to be sure others who should, understand it, and then to use it effectively.

As it is a subject which is meant to reach masses, remember that it must reach them through opinion leaders.

Opinion leaders may or may not be VIPs. But they are, whoever they are, barber or king, VIPs to the PR.

Thus surveys for opinion leaders are necessary. And the opinions of opinion leaders must be known.

And for heaven's sake restrain the boss from shooting opinion leaders no matter how just his wrath.

But also don't tell him Dr. Kutzbrain is an opinion leader just because he talks to two nurses and his wife.

Peace is not necessarily a target of PR. Survival is. And survival requires some control of opinion.

When this becomes control of numbers of people PR is only accomplished through opinion leaders.

PR SERIES 7

BLACK PR

About the most involved employment of PR is its covert use in destroying the repute of individuals and groups.

More correctly this is technically called BLACK PROPAGANDA.

Basically it is an intelligence technique.

It can be a serious error to cross intelligence and PR.

These are two different fields. They have two distinctly different technologies.

A PR man must also know something of intelligence technology. Otherwise one day he will be left gaping.

Intelligence is intelligence. PR is PR.

When you gather information by intelligence procedures and at once employ it for PR, the result is likely to be poor.

It is not that it isn't done. It's that it isn't very effective. Also it is an act of desperation.

PR IS OVERT.

INTELLIGENCE IS COVERT.

PR is at its best when it begins and ends overtly.

Intelligence is best when it begins and ends covertly.

PR with an open demand by known authors, a demonstration, a conference is normal PR.

Intelligence trembles on the edge of PR when filched data explodes a storm in the public. It recoils when the authors are then known.

Black propaganda is, in its technical accuracy, a covert operation where unknown authors publicly effect a derogatory reaction and then remain unknown.

The effect of black propaganda is largely wiped out by "Oh, it was the Germans who set them up."

So PR enters intelligence in this way: One finds who set up the black propaganda and explodes that into public view.

This use of PR is almost that of an auditor to the group. One is disclosing hidden sources of aberration.

To use intelligence to find where they hid the body and then flip over into wide publicity is not very powerful in actual practice. There better be a body there and one better tell the police not the public.

If there are no effective police, then one has the problem of police action. Exploding it to the public ideally is an effort to make the public a vigilante committee. Modern publics seldom rise this high. Educated publics seldom explode to the explosion.

A PR man who thinks of taking Blitz & Company's crimes to the public is really just dreaming hopefully — without foundation. It may or may not hurt Blitz. It might recoil. The ability of the public to stand around and look stupidly at a dripping-handed murderer without doing a thing about it is a symptom of our civilization. They *ought* to act. They don't. You can form an opinion amongst them but governing bodies won't consult it.

Exposure is not an effective road to *action*. It can be to opinion. It is slow.

Then what is effective?

INTELLIGENCE

By definition intelligence is covert. Undercover. If it is kept so all the way it is effective.

When intelligence surfaces it becomes very ineffective.

Threat and mystery are a lot of the power of intelligence. Publicity blows it.

Take the Red Orchestra, World War II, Stalingrad Campaign. In Berlin, Schultz-Boysen and other highly placed Russian agents got the whole German plan of the battle that was to be Stalingrad. Brilliant and covert intelligence. They passed it to the Russians. Brilliant and covert comm. The boss at Center in Moscow put the ring's names and addresses in a code radio message. The Germans of course broke the code. The Germans rounded them up and messily executed them on meat hooks. The Germans had no other battle plans but contemplated not attacking Stalingrad that way. This put the whole coup at risk. Then the Germans did use the plans the Russians knew and that was the beginning of the end of WW II.

So TWO exposures threatened the success of this intelligence coup. One was the stupid radio message. The other was the realization the Russians had the battle plans.

Exposure is the basic threat of intelligence.

PR is the willful broadcast of information.

The two don't mix well.

BLACK PROPAGANDA

Possibly used since the morning pale of history, black propaganda was developed by the British and German services in World War I into a fine art.

The word "propaganda" means putting out slanted information to populations.

One propagandizes the enemy population or one's own or neutrals.

In popular interpretation it is a parade of lies or half-truths or exaggerations.

PR and advertising technology and mass news media are employed as well as word of mouth and posters.

The trouble with it is that it can often be disproven, discrediting the utterers of it.

It may serve the moment but after a war it leaves a very bad taste.

If one is engaging on a campaign of this nature, its success depends on sticking to the truth and being able to document it.

The entire black propaganda campaign conducted for twenty-one years against Scientology began to fold up in its sixteenth year because never at any time did its instigators (a) have any factual adverse data or (b) tell the truth.

The Scientology movement continued if only by heroic means and much sacrifice.

But at last nobody of any note believed the propaganda.

The attackers pulled in on themselves a counterattack based on penetrating, horrible, documented truth.

It required intelligence-like tactics to discover who it was exactly.

The "dead agent caper" was used to disprove the lies. This consisted of counter-documenting any area where the lies were circulated. The lie "they were _____" is countered by a document showing "they were *not*." This causes the source of the lie and any other statements from that source to be discarded.

That real trouble and damage was caused Scientology is not to be discounted. The brilliance of the defense was fantastic. The depth and inroads the propagandists reached was alarming. BUT THEY DIDN'T MAKE IT.

Some black propaganda campaigns have won in other areas, not Scientology.

The British got the US into World War I with black propaganda, despite a president elected on a peace platform.

Many individuals have been destroyed by black propaganda. Wilhelm Reich was by the lies and violence of the FDA.

So black propaganda is not a certain-result technology. It is costly. It makes fantastic trouble.

Essentially it is NOT a PR campaign. It is a cross between PR and intelligence.

The technique is:

A hidden source injects lies and derogatory data into public view.

Since it *is* a hidden source, it requires an intelligence approach to successfully end it.

In the meanwhile the "dead agent caper" is the best tool to counter it.

Legal action can restrain such a campaign but is chancy unless one knows the source or at least has counterdocuments. It is risky solely because "law" is unpredictable. However legal action has a definite role in restraining, not in ending, such a campaign.

A good policy when faced with a black propaganda campaign is to defend as best you can (dead agent and legal restraints) while you find out (intelligence) WHO is doing it. Then, confrontation can occur. Finding and suing false whos can make things much more involved.

Black propaganda countercampaigns are inevitable. One engages upon them whether he would or no. These are engaged on while one narrows down the area to an exact WHO. For instance, one knows the Whatsits are attacking one. Thus he can counterattack the Whatsits. But *what* are the Whatsits exactly? and to whom are they connected? and exactly WHO, an individual always, is keeping it going? These last three have to be answered eventually. And that requires an intelligence-type search.

THE CROSS

So there is where intelligence and PR cross.

When PR goes into black propaganda (hidden source using lies and defamation to destroy) it has crossed intelligence with publicity. They don't mix well.

The action is risky to engage upon as it may run into an ex-intelligence officer or trained intelligence personnel. It may also run into a dead agent caper or legal restraint.

Anyone engaging in black propaganda is either using a wrong way to right a wrong or confessing he can't make it in open competition.

PROTEST PR

Outright protest PR based on facts is a legitimate method of attempting to right wrongs.

It has to be kept overt. It has to be true.

Protest PR can include demonstrations, hard news stories and any PR mechanism.

Minorities have learned that only protest PR can get attention from politicians or lofty institutions or negligent or arrogant bosses.

Where protest PR is felt to be a necessity, *neglect* has already occurred on the issues.

The riots of Panama some years ago were very violent, verging on open war. This followed the negligence of the US in negotiating new treaties, a matter arranged for long ago and arrogantly skipped for several years by the US.

The slaves were freed in 1864 but were either misused or neglected for the next century and finally became a key racial problem full of demonstrations and riots and social unrest. Imperfect redress of wrongs following these then continued the riots. This is probably the biggest PR mess of the last century and a half, wobbling this way and that. It is still in the stage of protest PR, possibly because it went so very, very long unhandled.

The only real recourse these people had was protest PR. Recently, black congressmen were refused audience by the president and had to stage a demonstration before it was granted. But protest PR *did* obtain an audience.

The silliest idea of modern times is conscription. Draftee soldiers might possibly be excused as a *levée en masse* but not as the habit of government in peace and war just to overcome their lack of ability to make the country worth fighting for and the armed services a stable, attractive career. This is all the more foolish since hardly anyone in history ever had any trouble recruiting an army that could pay for one. Even Gibbon remarks on it as an amazingly easy thing to do in any civilization. And that is true today.

So conscription is continued. Facing every young man with an arbitrary military future was a bad thing. Napoleon invented it and he lost.

Protest PR was the answer used to contest it. Met by force and violence, it has not halted.

Somebody will have to give the country a nobler cause more decently prosecuted, will have to better the services and conditions and will have to admit men without demanding their right names or perfect physique and make them immune to recall for civil offenses. Probably that army would fight well. Conscript services are too expensive, too inefficient and too ready to revolt for any sane government to use them. But here this unhandled wrong has to resort to protest PR.

So protest PR has its place. It is a fine art. It is the subject of fantastic skill and tech.

It is not good. But it does work and it is used as a last resort when normal hearings and good sense fail.

When money and force lead and opinion leaders are unheeded, when special privilege enters management or government, protest PR, the strike, the demonstration, is the tool employed.

If that doesn't work, or if it is crushed, subversive actions, general intelligence actions, black propaganda and other evils occur.

PR used soon enough can avert much of these consequences.

But there are always two in any fight and the other side may not want to live and so set themselves up.

Intelligent early PR is the best remedy. But it is not always possible.

PR SERIES 8

TOO LITTLE TOO LATE

The hallmark of bad promotion is "Too Little Too Late."

Probably the most aggravating and most suppressive error that can be made by those doing promotion or other PR actions is to plan or announce an event too close to the date for anyone to come.

Typical report: "Only fifty came to the congress. I guess it just wasn't popular."

An exec hearing this can validly suspect "too little too late" as the real WHY. He would be 95 percent right without even querying further.

"When did you announce the July 1 congress?" Usual true answer: June 25! "How many mailings were sent?" Usual true answer: Five hundred "because FP . . ." "What other promotion was done?" Usual true answer: None.

Reason for only fifty at the congress: "Too little promotion announced too late for anyone to come."

Often this factor is hidden. Other more dramatic reasons, not the true WHYS, are advanced. "There was a football match the same date." "We are in disrepute." "There is an anticampaign." "The press . . ." Yap, yap, yap. All lies. It was just too little promotion too late.

"Nobody showed up for the VIP dinner." The right response to this is, "When did you send the invitations?" "Well, you see, FP wouldn't give us any stamps so . . ." "WHEN did you send the invitations?" "The same morning as the dinner was held." "Were they engraved?" "No, we sort of ran them off on mimeo."

Just *why* event failures are 95 percent traced to "handled at the last moment without proper planning and without proper verified addresses and without enough posh or volume" is itself a mystery.

Undermanned PR section is the most charitable reason.

PR in reality is about 80 percent preparation of the event and about 20 percent event.

If the preparation is not planned and prepared fully well in advance of the event, the events fail.

Off-the-cuff PR is sometimes necessary. But usually made necessary by lack of foresight and hard work.

INDEX

There is a rule about this:

THE SUCCESS OF ANY EVENT IS DIRECTLY PROPORTIONAL TO THE TIMELY PREPARATION.

In other words, poor preparation made too late gives an unsuccessful event.

PR is hard work. But the hard work mostly occurs before there is any public view of it. The work in the event itself is pie.

You see these beautifully staged affairs, these flawless polished occurrences. They look so effortless. Well, they LOOK effortless because a fantastic amount of preparation went into them ahead of time.

A well-attended event is planned and drilled and announced ages ahead of the occurrence.

Even a mere dinner has to be announced at least a week in advance.

PRs who don't work hard to plan and drill and who don't announce in time with enough promotion have flops.

So PR flops come from failures to plan, drill, promote enough and in plenty of time.

Therefore PR successes are best guaranteed by data gathering, sharp planning, heavy drilling, timely announcement and adequate promotion.

Even a surprise event has to be handled this way for everyone except those for whom the surprise is intended.

So gather the data that will guide planning, plan well, program it, do all the clerical actions necessary, announce it in ample time, drill all those connected with it heavily until they're flawless and then stage it.

And there you are, a "spontaneous," highly successful event.

Whether it's a protest march, a press conference, a congress, a new course or dinner for VIPs or even just friends, if it's to be a success, prepare it and announce it widely in plenty of time.

There was this grave where they buried a failed PR man. And on the headstone they put, "George Backlog. Too Little, Too Late." They had to shoot him because he broke the company's leg.

A mediocre event very well prepared and announced well and in time will succeed better than the most splendid event done off-the-cuff.

The next time you see empty seats remember and use this PL. Or better still, do it right in the first place.

PR SERIES 9

MANNERS

The original procedure developed by man to oil the machinery of human relationships was "good manners."

Various other terms that describe this procedure are politeness, decorum, formality, etiquette, form, courtesy, refinement, polish, culture, civility, courtliness and respect.

Even the most primitive cultures had highly developed rituals of human relationship. In studying twenty-one different primitive races, which I did firsthand, I was continually impressed with the formalities which attended their interpersonal and intertribal and interracial relationships.

Throughout all races, "bad manners" are condemned.

Those with "bad manners" are REJECTED.

Thus the primary technology of public relations was "manners."

Therefore a public relations man or team that has not drilled and mastered the manners accepted as "good manners" by those being contacted will fail. Such a PR man or team may know all the senior PR tech and yet fail miserably on the sole basis of "exhibiting bad manners."

"Good manners" sum up to (a) granting importance to the other person and (b) using the two-way communication cycle (as in *Dianetics 55!*). Whatever motions or rituals are, these two factors are involved. Thus a PR violating them will find himself and his program rejected.

Arrogance and force may win dominion and control but will never win acceptance and respect.

For all his "mental technology" the psychiatrist or psychologist could never win applause or general goodwill because they are personally (a) arrogant beyond belief, (b) hold others in scathing contempt ("man is an animal," "people are all insane," etc.). Born from Bismarck's military attitude these subjects have borrowed as well the attitude which made the Nazis an object of worldwide condemnation. No matter how many people were maimed or killed, the Nazi would never have dominated the world any more than their "mental scientists" will ever win over humanity.

They just don't have "good manners"; i.e., they do not (a) consider or give others a feeling of importance and (b) they are total strangers to a comm cycle.

SUCCESSFUL PR

All successful PR, then, is built upon the bedrock of good manners as these are the first technology developed to ease human relations.

Good manners are much more widely known and respected than PR tech. Therefore NO PR tech will be successful if this element is omitted.

Brushing off "mere guards" as beneath one's notice while one goes after a contact with their boss can be fatal. Who talks to their boss? These "mere guards."

Making an appointment and not keeping it, issuing an invitation too late for it to be accepted, not offering food or a drink, not standing up when a lady or important man enters, treating one's subordinates like lackeys in public, raising one's voice harshly in public, interrupting what someone else is saying to "do something important," not saying thank you or good night — these are all "bad manners." People who do these or a thousand other discourtesies are mentally rejected by those with whom they come into contact.

As PR is basically acceptance then bad manners defeat it utterly.

A successful PR person has to have good manners.

This is not hard. One has to assess his attitude toward others and iron it out. Are they individually important? One has to have his two-way comm cycle perfect, so perfect it is so natural that it is never noticed.

Given those two things, a PR can now learn the bits of ritual that go to make up the procedure that is considered "good manners" in the group with which he is associating.

Then given PR tech correctly used, one has successful PR.

IMPORTANCE

You have no idea how important people are. There is a reversed ratio — those at the bottom have a self-importance *far* greater than those at the top who *are* important. A charlady's concept of her own importance is far greater than that of a successful general manager!

Ignore people at your peril.

Flattery is not very useful, is often suspect, as it does not come from a sincere belief and the falsity in it is detectable to all but a fool.

A person's importance is made evident to him by showing him respect, or just by assuring him he is visible and acceptable.

To see and acknowledge the existence of someone is a granting of their importance.

To know their name and their connections also establishes importance.

Asserting one's *own* importance is about as acceptable as a dead cat at a wedding.

People have value and are important. Big or small they are important.

If you know that, you are halfway home with good manners.

Thus PR can occur.

COMMUNICATION

The two-way comm cycle is more important than the content.

The content of the comm, the meaning to be put across to another or others is secondary to the fact of a two-way comm cycle.

Comm exists to be replied to or used.

Comm with the comm cycle being in first must exist before it carries any message.

Messages do not travel on no line.

Advertising is always violating this. Buy Beanos! Into the empty air. Other things must establish the line. And the line must be such as to obtain an answer, either by use or purchase or reply.

A funny example was a letter writer who without preamble or reason told people to buy a multi-thousand dollar package without even an explanation of its use or value. Response zero. No comm line. He was writing to a name but not really to anyone.

In social intercourse a comm cycle must be established before any acceptance of the speaker can occur. Then one might get across a message.

Good manners require a two-way comm cycle. This is even true of social letters and phone calls.

Out of this one gets "telling the hostess good night as one leaves."

One really has to understand the two-way comm cycle to have really good manners.

Without a two-way comm cycle, PR is pretty poor stuff.

PRIMITIVES

If an American Indian's ritual of conference was so exact and complex, if a thousand other primitive races had precise social conduct and forms of address, then it is not too much to ask modern man to have good manners as well.

But "good manners" are less apparent in our times than they once were. This comes about because the intermingling of so many races and customs have tended to destroy the ritual patterns once well established in the smaller units.

So one appears to behold a sloppy age of manners.

This is no excuse to have bad manners.

One can have excellent manners by just observing:

a. Importance of people

b. Two-way comm cycle

c. Local rituals observed as proper conduct

These are the first musts of a PR man or woman.

On that foundation can be built an acceptable PR presence that makes PR succeed.

BREAKTHROUGH PR AND PRODUCTION TONE SCALE SURVEYS

Ref: Tape: 7101C18, FEBC Tape 2, "PR Becomes a Subject," which contains the full text on using Tone Scale surveys in PR.

THE LAWS OF PR

THE PRIMARY BARRIER TO PRODUCTION IS HUMAN EMOTION AND REACTION.

PR IS THE SOCIAL TECHNOLOGY OF HANDLING AND CHANGING HUMAN EMOTION AND REACTION.

A LOW PRODUCTION AREA IS OUT–MORALE BECAUSE IT IS LOW PRODUCTION. IF YOU CAN NURSE THE AREA UP TO PRODUCTION, YOU HAVE MORALE.

DON'T USE NEGATIVE ARC IN A PR SURVEY. MAKE IT LIGHT SO IT INVOLVES COMMUNICATION.

To get a PR survey done in an area that is barriered against production, you begin by writing down three VERY DIRECT questions that you want answered. One question for each of BE, DO, HAVE.

On a survey of Lower Slobovia central command point, the three direct questions could be:

1. (BE) Do you want this joint to succeed?

2. (DO) Are you personally going to be active in getting this show on the road?

3. (HAVE) Are you going to directly assist Scientology to acquire Lower Slobovia?

Now you translate these into the field of human emotion. Each direct question is concerned with one or more of A, R and C. You put down by your direct question what each question is concerned with.

In the example above,

1. is A,

2. is A or C,

3. is R.

You now phrase a question to which you will get a reaction, and that reaction you get has to be the reaction of the individual to the *direct* question, but you get that reaction by asking him a different question translated into terms of emotion that will give you his reaction willy-nilly. He can figure his way round the direct question to give you a PR answer. He cannot help but give you his reaction if you involve his emotions. The direct question does not involve his emotions so that he doesn't give a reaction you can observe clearly as *the* reaction to the question.

Having established your BE, DO, HAVE questions and added your connotations of A, R, C, you can translate the direct question into a survey question that involves his emotions and gives you his reaction.

The examples above could translate as follows:

1. Do you think that increased efficiency in management would bring about a more desirable organization?

2. Would it be more pleasant working within such a framework?

3. Have you envisioned improvements that would occur in Lower Slobovia if Scientology were more widely used?

Now you pretest the survey mentally, paying attention to diction and comprehension, rephrasing to ensure adequate communication without losing any of the sense of your question, per the art formula.

The surveyor contacts the people to be surveyed, asks his questions and makes notes of the answers given; he also makes sure he notes the reaction. He should write down the *tone level* of the reaction to each question. He doesn't handle anything — just the question, recording the answer and the reaction.

Tabulation of the results gives you a majority of reactions on one tone level.

You can now design your PR campaign on a tone level half or one notch above that level and be sure to obtain wide agreement, by the rules contained in *Science of Survival.*

Thus the barrier of human emotion and reaction is removed.

The duty and function of PR is to remove the barrier of human emotion and reaction.

You hit at the heart of reaction when you get into human involvement.

You hit at the basic on any production situation when you get into BE, DO, HAVE.

You hit at his emotion when you address his A, R, C.

So you involve him when you get his emotion and thus his reaction.

You can strip off the verbiage in the survey and its tabulation and get a numerical answer (tone level figure) for each question.

Different publics can be PRed. Finance publics, for example, as well as production publics — sometimes finance people get into conflicts with production.

PR is always perfectly okay as long as it is real. If not real, it acts as a stop. You find the R by establishing if there is a situation to begin with, surveying to get the tone level, figuring out the majority response of the group on each question — and design a PR campaign to handle.

These are the basic concepts of the science of PR. It covers the field of manipulation of human emotion.

PR SERIES 11

PROPAGANDA BY REDEFINITION OF WORDS

A long-term propaganda technique used by socialists (communists and Nazis alike) is of interest to PR practitioners. I know of no place it is mentioned in PR literature. But the data had verbal circulation in intelligence circles and is in constant current use.

The trick is—WORDS ARE REDEFINED TO MEAN SOMETHING ELSE TO THE ADVANTAGE OF THE PROPAGANDIST.

A prime example is the word CAPITALIST. Once it meant "one who makes his income from the interest of loaning money to others." That is still the definition in economics. Through propaganda redefinition a capitalist became a person of wealth who invested in *business* (making him an owner, not a banker) and currently is someone who exploits others, urges war and stamps on workers! In short, the word is changing in meaning by the efforts of those who are trying to own everything in the country under the guise of being the workers' friend. Totalitarian socialism must eradicate the private owner in order to grab the property for themselves. Hence, an intense concentration on redefining the word "capitalist" and "capitalism."

Many instances of this exist. They are not "natural" changes in language. They are propaganda changes, carefully planned and campaigned in order to obtain a public opinion advantage for the group doing the propaganda.

Given enough repetition of the redefinition, public opinion can be altered by altering the meaning of a word.

The technique is good or bad depending on the ultimate objective of the propagandist.

"Psychiatry" and "psychiatrist" are easily redefined to mean "an antisocial enemy of the people." This takes the kill-crazy psychiatrist off the preferred list of professions. This is a good use of the technique as for a century the psychiatrist has been setting an all-time record for inhumanity to man.

The redefinition of words is done by associating different emotions and symbols with the word than were intended.

The American Medical Association and the National Association for Mental Health in England and South Africa and the "British Psychological Association" in Australia have been working very hard to redefine Scientology in the public mind.

Two things occur because of this — the Scientologists are redefining "doctor," "psychiatry" and "psychology" to mean "undesirable antisocial elements" and are trying to stabilize the actual meaning of "Scientology."

The AMA has even gotten US dictionaries to redefine "Dianetics" as a "pseudoscience from science fiction."

Fortunately the public does not respect and is not responding to mass news media. Mass news media believes it steers public opinion, but in actual fact can get a reverse effect.

"The capitalistic AMA is seeking to deny the people the benefits of new discoveries such as Scientology because it would eradicate the great profits the AMA makes from the psychosomatic illnesses of the people," would be a statement reversing the reversal of meaning. One has to find, pinpoint and denounce the propagandists to make headway against such an effort of redefinition. One brands the propagandist and blows the effort to redefine, using a steady, standard PR campaign to do so.

One can also use redefinition by exposing the effort to redefine.

A case in point is the word "psychology."

Webster's International Dictionary of the English Language—1829 defines "psychology: a discourse or treatise on the human soul; the doctrine of the nature and properties of the soul."

Webster's High School Dictionary—1892 "psychology: the powers and function of the soul."

Merriam Webster's 3rd International Dictionary—1961 "psychology: the science of mind or mental phenomena or activities; the study of the biological organism (as man) and the physical and social environment."

Somewhere along the way, man lost his soul!

We pinpoint when and we find Professor Wundt, 1879, being urged by Bismarck at the period of Germany's greatest militarism, trying to get a philosophy that will get his soldiers to kill men. And we find Hegel, the "great" German philosopher, the idol of supersocialists, stressing that WAR is VITAL to the mental health of people.

Out of this we can redefine modern psychology as a German military system used to condition men for war and subsidized in American and other universities at the time the government was having trouble with the draft. A reasonable discourse on why "they" had to push psychology would of course be a way of redefining an already redefined word, "psychology."

The way to redefine a word is to get the new *definition* repeated as often as possible.

Thus it is necessary to redefine medicine, psychiatry and psychology downward and define Dianetics and Scientology upwards.

This, so far as words are concerned, is the public opinion battle for belief in *your* definitions and not those of the opposition.

A consistent, repeated effort is the key to any success with this technique of propaganda.

One must know how to do it.

HOW TO DO SURVEYS

Refs:

HCO PL	2 June 71R Rev. 28.7.83	PR Series 10 BREAKTHROUGH, PR AND PRODUCTION, TONE SCALE SURVEYS
HCO PL	15 Dec. 2000	PR Series 13 GOODWILL PROMOTION
HCO PL	7 Jan. 72R II Rev. 10.9.88	PR Series 15 Marketing Series 21 CREATING SURVEY QUESTIONS

This hat write-up by a Public Relations Officer, written at LRH's request, contains valuable data on how to do surveys.

SURVEY means "a careful examination of something as a whole and in detail."

The word "survey" as used in public relations and marketing terminology means to carefully examine public opinion with regard to an idea, a product, an aspect of life, or any other subject. By examining in detail (person to person surveying) one can arrive at a whole view of public opinion on a subject by tabulating highest percentage of popular response.

The purpose of this hat write-up is to describe the two most important aspects of surveying so that 100 percent successful results can be obtained every time. Though there are many different *types* of surveys, the method used is the same. The two components of surveying are:

1. The mechanics of doing the survey itself,

2. The beingness of the surveyor.

THE MECHANICS

The actions involved in doing a survey are simple and few. The first thing you do is establish the questions you are going to ask the public to find out what is wanted and needed, popular or unpopular or whatever. Creating the survey questions is a technology in itself and is laid out in the Marketing Series HCO PLs covering the different types of surveys which can be done.

After the questions are established they are mimeoed on survey forms or typed on a piece of plain paper for the surveyor to refer to. If one were doing a survey in a city where large numbers of people were interviewed, the survey forms might be most practical. However, all that is needed for most surveys is a clipboard with plenty of plain paper and several ballpoint pens. The survey question page is then placed on top of the pad of paper and flipped back while taking notes of the interview.

The only materials needed for a survey are several ballpoint pens (so running out of ink in the middle of the survey doesn't cause interruption), plenty of paper and a clipboard.

To begin a survey, you simply walk up to a person and in a friendly manner introduce yourself (if a stranger) and ask to survey them. If additional R-factor is requested, it is given and then the survey is begun.

Ask the person the first question, flip back the question page and take down the answer. Be sure to number the answers corresponding to the question number being asked. You needn't write down every word as the person speaks to you but get the most important points. You will find, after practice surveying, you can write almost everything down.

Also remember to note down the person's tone level reaction to each question.

After the person has answered the first question, thank him or her with good TRs to acknowledge that comm cycle and go to the next question. All you have to do is BE THERE, be INTERESTED in what the person is saying, and take down his answers.

At the end of the survey thank the person very much. The person will most likely be thanking you at this point as people LOVE to be asked their opinion of things, and having another terminal grant beingness to this and listen attentively is a rare and valuable experience to many.

Then go to the next person and repeat the same procedure. This is all there is to the mechanical action of surveying.

TABULATION OF THE SURVEY

The final tabulation of a survey is very simple. The following data was written and compiled while conducting an ethnic survey.

1. Count all the surveys.

2. Establish various categories of answers for each question by listing answers briefly as you go through the surveys.

3. Soon you will be able to merely mark a slant by each category, the slant meaning one more answer of a similar nature.

4. Then you total the answers given for a particular category of answer. Let's say you had 1,500 answers of a similar nature to one question and your total number of surveys is 2,500. This means 60 percent gave that similar type of answer (1,500/2,500).

5. You then list each question and under that question list the categories of answers and the percentage from the highest to the lowest.

6. The only mistake you can make is not to realize the similarity of answers and so have a great diversity of categories.

BEINGNESS OF THE SURVEYOR

Just as an auditor has to have his TRs in, has to abide by the Auditor's Code and BE there as a terminal for the pc to communicate to, so must a surveyor.

Outward appearance of the surveyor must be clean, tidy and the dress ethnically acceptable for whichever public is being surveyed.

A successful surveyor *must* have a high affinity for other beings—friends or complete strangers. A friendly NATURAL approach to people is required. A sincere smile and good TRs is the door opener. And CONFRONT. You have to reach out to complete strangers and get them interested in themselves enough to let you know what their reality is so you can help them.

This is completely natural to any trained Scientologist anyway. A Scientologist knows the formula of communication, knows to grant beingness to another, and that ARC = Understanding. With these factors and the basic TRs in, the person being interviewed will feel relaxed about communicating his ideas and realities.

This is *all* there is to surveying, and you will be amazed with the results attained!

PITFALLS

Listed below are some DON'TS just to make sure possible pitfalls are known about and avoided.

1. Don't dress in an unclean or unethnic way. That would automatically make you unwelcome.

2. Don't be short of materials and have to fumble for a pen or survey form. The person might walk off from you in the meantime if you're doing a survey on the street.

3. Don't be backward or shy. This would make you look unconfident of your own product or purpose for being there.

4. Don't overwhelm with forceful, overzealous approach or comm.

5. Don't be overserious, or on the other hand giddy. Anything phony is absolutely detrimental.

6. Don't do socially unacceptable practices like chewing gum loudly, biting your fingernails or any one of dozens of other little annoyances.

7. Don't be in too much of a hurry. The person must feel you CARE about what he feels and thinks.

8. Don't be propitiative or the other extreme, condescending. Be YOURSELF, in valence and confident.

9. Don't cut a person's comm or be gruff in any way.

10. Don't act supersweet either. Be *friendly* and BUSINESSLIKE.

As a matter of interest, there is a certain PR textbook which describes a method of surveying called "depth interview." It is said that this method takes highly trained interviewers and skilled analysts.

Now these fellows think a successful surveyor needs *years* of training of some kind or another.

But because you have the technology to UNDERSTAND the basics of the mind, yourself and other people, you accomplish what seems *miraculous* by any other standards.

The miracles of survey results are easily obtainable and *valuable*. But don't be surprised if other people still think you're a genius.

GOODWILL PROMOTION

(Taken from an LRH conference of 14 Dec. 71 given aboard the Flagship *Apollo*.)

Ref: HCO PL 7 Apr. 83R
Rev. 30.10.2000

Exec Series 25
PR Series 41
GOODWILL

There is a different brand of promotion called "goodwill."

What is goodwill?

When a business is sold, goodwill has value. One might say, "$100,000 for assets and $100,000 for its goodwill." That means its customers, its repute and knowingness.

That is goodwill. It is a commodity. It is the ARC people have for it, or the willingness people might have to exchange valuables for it.

It is a whole subject in itself.

Goodwill is something you build by PR.

For instance, the Aluminum Company of America sells nothing whatsoever to the public directly. But it has huge ads all over the place that are called "goodwill ads," so the public will think well of it. That gives sort of a background structure against which one can erect an advertising campaign that offers people something valuable. Now the manufacturer can say, "This tank is built out of Aluminum Company of America aluminum and it won't poison your child," and people will have confidence in it because Aluminum Company of America has advertised goodwill.

SURVEYING FOR GOODWILL

In doing a survey to determine goodwill you might ask "What do they like about _____?" or "What is popular?" or "What do people think about _____?" And what little counterpoint needs correction? Only you don't publicize *that* too much, you just curve it in and correct it. You don't say, "That is denied." You just announce a contrary fact. Sometimes you have to be very clever. For example, someone says, "Well, everybody in that boarding school is being starved." You don't ever say, "Everybody is not being starved." You put out a typical menu of the place, all glossed up. And right away people say, "Well, there must have been something wrong with that rumor."

By getting information, regardless of whether it's gotten by survey or otherwise (although it is usually only reliable when gotten by survey), or by taking a survey done from something else, you can open the door to goodwill. And with goodwill advertising you can inevitably and invariably refute the current opinion, utterly, without ever mentioning it.

GOODWILL EQUATION

Goodwill equates to life. Because (1) if you are *not* communicating you are obviously not alive and (2) if you are communicating *bad* things why then you obviously are in a very low-toned state and you are so weak that you have to pay attention to it.

For example, one could go out and answer, as a rebuttal, everything bad ever said about them, making a catalog of all those things. But it would be the most idiotic piece of PR work that was ever done under God's green earth. Yet by just being alive and continuing to communicate and continuing to reach people, these things are shown to be untrue anyhow.

So one can see what goodwill advertising uses as its equation:

Theta = life

Goodwill promotion = life.

REMIMEO
DIV 6

PR SERIES 14

PRO AREA CONTROL

(Originally written by LRH as Flag Order 3094
of 16 Dec. 71. Issued as an HCO PL on 28 July 83.)

PRO (Public Relations Office) Area (port and town and country) Control (regulate, start change and stop from cause-point) is the basic action of the Port Captain's Office (or Div 6 in an org).

Customs, immigration, dockmasters, police, officials, town officials, inhabitants, country officials, country inhabitants, and the lines and activities of all these as they affect the ship or org are the subject of "PRO Area Control."

The tech of how this is done is found in the book *Effective Public Relations,* the PR Series PLs, Flag Orders and Flag Ship Orders. It is a technology.

The extent of one's PRO area control can be measured at once by counting up the points one is not controlling from the company or org viewpoint and the points one IS controlling. This gives you a ratio like 3 to 6 or one-half.

Example: Immigration and customs are NOT doing what we want. Agents, dockmasters and police are. Thus we have two-thirds effective PRO area control.

This is poor, showing a one-third failure.

Now the *tech* to apply is a *survey* of all five points to find out, let us say, what they want one to be, what they want one to do, and what they want to have from one. (See FEBC tape on PR.)

Then one surveys further to find out what problem they are trying to solve by having us be, do, have these things.

This puts us at cause because we can now handle their misinformation, reassure their suspicions and generally increase ARC.

A project to get all required points now known in and followed would now be done and executed.

Result — PRO Area Control.

CREATING SURVEY QUESTIONS

Refs:

HCO PL	2 June 71R Rev. 28.7.83	PR Series 10 BREAKTHROUGH, PR AND PRODUCTION, TONE SCALE SURVEYS
HCO PL	5 Dec. 71R Rev. 10.9.88	PR Series 12 Marketing Series 20 HOW TO DO SURVEYS
Tape:	7101C18 FEBC Tape 2	"PR Becomes a Subject"

The following policy letter was written by an experienced surveyor. It is a brilliant issue which puts PR survey tech right on the line, and is full of examples of actual surveys both for production internal and sales external.

The purpose of this policy letter is to fully document *how* survey questions to evoke human emotion and reaction are derived. Included are examples of actual surveys done, showing the SITUATION, the SURVEY QUESTIONS, the SURVEY RESULTS and resulting PR program to handle. A good many of the surveys were done within the org to find human emotion and reaction barriers to production amongst staff members. The examples are given in chronological order so that one may see how the survey and PR technology was evolved by Ron during the years of 1970 and 1971.

SURVEY EXAMPLE 1

SITUATION:

Due to various causes, morale is not what it should be aboard.

The full intention of Command is to have things running smoothly and safely for all hands.

Major Target:

To interview each individual crew member and obtain his honest state of opinion regarding his post and issues.

Vital Targets:

1. Not to interrupt the work of or worsen the situation.
2. To improve matters by survey.
3. To obtain data so that a new sensible reality can be established by PR programs.

Primary Targets:

1. Provide yourself with paper, clipboard and ballpoints.
2. Work at this at optimum periods.

Operating Targets:

1. To approach persons individually. Draw them out of groups.
2. Just listen and prompt and question. Don't interrupt or interject. Don't comment on what they say to them.
3. Make useful, not necessarily voluminous, notes.
4. Cover each question.
5. Excerpt results.
6. Design programs to handle what is found.

QUESTIONS AND RESULTS:

Survey R-factor — The Commodore wants your opinion on certain matters to help handle them.

1. What do you feel command intention really is?

   33% Clear the planet.

   31% Something planned from Source or high org executive to be carried out by staff members.

   16% Everyone doing his job and getting the show on the road.

   7% Well-trained crew in tech, policy and seamanship.

   5% Provide safe environment so LRH can get on with his research.

   5% Successful management of outer orgs.

   3% Miscellaneous.

2. What do you feel you should know more about to get your job done?

30% Tech, policy and seamanship.

22% OEC policy.

20% Specifics relating to hat.

14% Nothing in particular.

9% More briefing re schedules and Flag Org actions with outer orgs.

5% Scientology tech.

3. What do you really need to get your job done?

32% Nothing in particular.

20% More training.

17% Specifics pertaining to hats.

13% More time (without arbitraries and distractions).

8% More personnel.

7% To be left alone to get on with it.

3% More briefing of ship schedules for planning work cycles.

4. What would you like to see us doing?

31% Expanding Scientology around the planet.

21% Group cooperation and coordination.

16% Crew getting trained and OT.

14% What we are doing.

13% Moving more and to different ports.

3% Getting stats up in outer orgs.

2% Miscellaneous.

5. What changes should occur?

30% What we are doing is good.

24% More expansion in the field for more flow of recruits to Flag.

20% More trained personnel in tech and policy.

13% More briefing of the crew on Flag Org operations.

7% Specifics relating to post.

4% No opinion.

2% Miscellaneous.

The following is an item from the Flag Orders of the Day with regard to the tabulated survey, written by LRH:

24 April 1970

"SURVEY

"The survey of the ship's company purposes and opinions has been completed and all hands are thanked for their contribution to it.

"Results will be issued in due course.

"There is an astonishing similarity in the answers which demonstrates we are all of similar opinion on vital questions.

"It discloses there is far less dissidence in the company than might have been supposed.

"We are a true group.

"The survey will be of great use in future planning.

LRH, COMMODORE"

SURVEY EXAMPLE 2

SITUATION:

"INJURY SURVEY

"Please interview the 5 people recently injured to discover:

"What's going on?

"I've never had any injured people like this.

"All in this port.

"See if you can 2-way comm it and get some common denominator.

Love,
Ron"

RESULTS:

The common denominator found followed this pattern:

1. EXTERIOR at time of injury.
2. Attention OFF the body.
3. Physical contest being engaged in.
4. NO PAIN involved (though 2 needed stitches!).
5. NO MISEMOTION at having injury, mild interest only.
6. A feeling of POWERFULNESS prior to injury.

Following is an item entered in the next day's Orders of the Day by LRH:

4 June 1970

"INJURIES

"Those recently injured were not PTS. Survey showed they were exterior and feeling powerful and didn't watch where they were sending the body.

LRH, COMMODORE"

SURVEY EXAMPLE 3

SITUATION:

A cross-section survey is needed on *what we are thought to be aiming for*.

QUESTIONS AND RESULTS:

1. What is your conception of what we are doing currently?

   Getting the ship's company trained up in specialist seamanship and then admin functions.

   Getting Scientology tech fully back in use and orgs running smoothly.

2. What is your idea of the ideal we are working towards?

   Immediately — smooth running Sea Org and Scientology networks.

   Ultimately — a clear and sane planet.

3. What is being done to achieve it?

   Strengthening ourselves internally while keeping our external lines operating.

4. Do you feel we are making it?

   Yes!

5. Does anything need to be changed so we can make it faster?

   More training.

   More processing.

   Any counter-intention removed.

   More promotion.

   Faster and wider acceptance of Scientology.

6. When do you think we will make it?

Current ship programs	2–6 months.
Scientology org programs	1–2 years.
Planetary Scientology influence	2–5 years.
Real planetary control	10–20 years.

An LRH Orders of the Day item of the next day comments on the survey results:

24 June 1970

"SURVEY

"The cross-section survey just done regarding what we are doing showed 'very good results, and the answers were quite consistent.'

"We sure have group agreement on what we are doing!

"There were very good indicators on this survey. There was an overall feeling of confidence among all those surveyed (a 28-person cross section of the ship).

"There was confidence that we are progressing on a steady and positive uptrend and that the next few years will show monumental victories in our favor.

LRH, COMMODORE"

BREAKTHROUGH

During the month of January 1971 LRH made a major advance in the subject of PR and surveying. That is — PR surveying in combination with the Tone Scale tech. He discovered the basic laws of PR as contained in HCO PL 2 June 71R, PR Series 10, BREAKTHROUGH, PR AND PRODUCTION, TONE SCALE SURVEYS and LRH Tape 7101C18, FEBC Tape 2, "PR Becomes a Subject."

Thus, ONE SURVEYS TO FIND THE REALITY OF A PERSON *ABOUT* SOMETHING.

The person's tone level about this subject is noted. This tone level establishes the affinity, or lack of, the person has about the subject. Emotion is A (affinity). A is the Tone Scale. (NOTE: The person's tone level *toward* the surveyor and *about* the subject may be two entirely different tone bands so don't get them confused. The person may be in Enthusiasm toward the surveyor but Antagonism about the subject being surveyed. It is the latter tone level which is of value. People don't just have a tone. They have a tone *toward* something.)

You survey to determine the R (reality) of each person so as to raise the A about the subject through the PR campaign.

You're looking for agreement. This is the key to SALESMANSHIP. To get agreement you come down to the point where the guy will agree with you. You determine the R (reality) they agreed with. Translate this into A (affinity tone). R is monitored by A. You then raise the R one half to one tone band and this establishes the C (comm) level.

The following item by LRH in the Orders of the Day of 25 January 1971 summarizes this:

"PR

"Some more PR data has been developed. The same public varies by continent.

"One tests the tone with R questions, reads the A off the Tone Scale, develops the program at the A half a tone above and uses the R of that tone. R to A, up half, A of that to new R desired. Gives one the program that *communicates,* raises tone.

"A survey of a tone must be a tone *about* something.

"See *Science of Survival*'s Chart of Human Emotion. Read the book. The new and future bible of PR, followed by *8-8008* for the graduate PR expert! Finally came into its own!

LRH, COMMODORE"

On 18 January 1971 Ron made a tape entitled "PR Becomes a Subject," which outlines the basic laws of PR and describes how PR survey questions are derived. An excerpt follows:

"PUBLIC RELATIONS IS FOR THE HANDLING AND CONTROL OF HUMAN EMOTION AND REACTION.

"IT'S A THIRD DYNAMIC TECHNOLOGY.

"How do you get these questions? That's very simple. There's nothing much to this question.

"Three questions. One is the equivalent of BE, one is the equivalent of DO, one is the equivalent of HAVE. BE, DO, HAVE — three questions.

"Above and below it, why, you could have a couple of null questions. You're trying to find out if somebody on the assembly line likes automobiles. He's building them; does he like them? Well, that's an easy one because it's already a human emotion. 'Do you LIKE automobiles?'

"Well, let's find out if he's going to *work* on the assembly line. Let's make it a little bit tougher. Now, we're going to find out 'Are you going to work on the assembly line?'

"All right, we go around and ask, 'Are you going to work on the assembly line?' The guy says 'no' and the next guy says 'yes' and so forth. You're noplace.

"So therefore, you take the questions you want to know on the subject of BE, DO, HAVE, and you encode them into human emotion using the ARC triangle. We don't care whether you put A or R or C after each question. You're going to translate the basic question that you know into human emotion in order to obtain involvement. And you immediately have involvement. So, you get the true answer, don't you?

"But the target of your subject is of course the control of human emotion and reaction. So if that is the case then you would have to have involvement in human emotion and reaction.

"So, how do you put this question together? Let's go right back to battery now. This subject is the control of human emotion and reaction, so therefore the questions of your survey have to be what you want to know transported over into a human emotion and reaction.

"BE: 'Do automobiles exist?' translated once across for an A is 'Do you like automobiles?' Now, you will get then an emotional response which can be plotted.

"Now, why all this? Now you see, I am teaching you this backwards. I'm moving back. Now the penny drops:

"THE PRIMARY BARRIER TO PRODUCTION IS HUMAN EMOTION AND REACTION.

"That's the primary barrier to production. And all at once we know where PR lives. There's its use. Not in getting somebody to 'become a man of extinction by drinking Seagram's whiskey' to aid and assist advertising, which would be a minor use, but actually to sound out the public to which the campaign is addressed so as to handle the human emotion and reaction.

"Now I'll trace it back through the basic laws that we're involved with, then.

"THE PRIMARY BARRIER TO PRODUCTION IS HUMAN EMOTION AND REACTION.

"PUBLIC RELATIONS IS THE TECHNOLOGY OF HANDLING AND CONTROLLING HUMAN EMOTIONS AND REACTION.

"So you have to find out what is the human emotion and reaction, so you get an encoding of the three questions: one BE, one DO, one HAVE; you translate those over into an emotional question by adding the ARC triangle; you plot that; now you get your human emotions in response to these questions; you add them up; you put your program together against the Tone Scale, one half to one band above. You will have a pretty uniformly successful method of reach.

"So, when all seems too grim and you can't seem to get your point across and you can't seem to get your product and it just won't organize that way, then you do have a tool. And that tool is called PR.

"And it has its own technology and we have made a breakthrough in this subject."

EXAMPLE

As an example of this, let's pretend we want to survey HCO. The ED of the org has an idea not a person in HCO is hatted, though a major product of HCO is personnel hatted. In this HCO there may be some counteropinion re getting hats on. The implementation of policy of management is the first line of PR.

We're trying to obtain data to popularize and remove barriers from hatting. It may very well be hatting is the least popular function of HCO.

Developing the Survey Questions:

1. You make a statement of a possible situation. (E.g., it may be hatting is the least popular function of HCO.)

2. You then think up several BLUNT, head-on type questions:

   BE: What is your hat?
   DO: What do you actually do?
   HAVE: What is your product?

3. You then convert those questions so you get a HUMAN ELEMENT. In that way you get an involvement. A PR survey question must *always* contain a "human" or "being" involvement.

   BE: Are you interested in your hat?
   DO: Do your duties align with your own purpose?
   HAVE: Do you consider your product contributes to the group?

A further question encoded could be:

DIRECT: Are you being trained in your hat?

to

ENCODED: Do you find the training you are getting on your hat interesting?

The purpose of this survey would be to obtain data to popularize and remove the barriers from hatting.

RE: PRODUCTION

Validation of accomplishment is garden-variety PR.

One rule about a product officer is he has to *want* the product before he gets it. This is human emotion and reaction.

Thus there is the:

1. ADMIN approach, which the org or product officer uses which is a straight question. (E.g., "What is your hat?")

2. HUMAN (or PR) approach, which is used by the PR man to find basic desires and OPINION. (E.g., "Are you interested in your hat?")

YOU HIT AT THE HEART OF THE "RESISTANCE TO" WHEN YOU GET INTO THE HUMAN INVOLVEMENT.

The key PR datum is of course THE GREATEST BARRIER TO PRODUCTION EFFICIENCY IS HUMAN REACTION.

and

A LOW PRODUCTION AREA IS OUT–MORALE BECAUSE IT IS LOW PRODUCTION.

IF YOU CAN NURSE IT UP TO PRODUCTION, YOU HAVE MORALE.

SURVEY EXAMPLE 4

SITUATION:

A survey needs to be done in Department A to find out who or what keeps the area upset.

DIRECT QUESTIONS

BE: Do you want your job?
DO: Are you doing your job?
HAVE: What is wrong in Dept A area?

ENCODED QUESTIONS

BE: Do you enjoy your post?
DO: Are you having any difficulties on your post?
HAVE: What changes are needed, if any, in the Dept A setup?

RESULTS:

Ten staff out of 17 had good indicators, were willing, having wins and creating their posts.

The other 7 were to varying degrees conservative about their posts, having minor difficulties and upsets.

It was found that unstabilization was coming from external sources to the division, i.e., HCO (1) allowing frequent personnel changes and (2) not ensuring the area was hatted.

HANDLING:

These two factors were gotten in on HCO from an exec level and the Department A area stabilized remarkably.

SURVEY EXAMPLE 5

SITUATION:

An urgent order was given to the Tech Div in an org. It was not done and the situation went unhandled, causing severe overload to staff in the area.

We are looking for an attitude of defiance and one or more attitudes of helpless child.

DIRECT QUESTIONS

1. What hat are you wearing actually, if any?

2. Why didn't you handle your post in this emergency?

3. Are you unwilling to have fast tech lines and stats?

ENCODED QUESTIONS

Affinity Tone	1. Did you like the hat you were assigned?
Affinity Tone	2. What did you feel about the situation?
Affinity Tone	2A. What was unpleasant about it?
Communication Tone	3. How do the present tech lines compare with the early ones we had?

RESULTS:

Various terminals in the area were found to be antagonistic and some apathetic. Others were found to have realized their failure to handle the situation and had taken steps to prevent reoccurrence.

By isolating these factors it was then possible, by keeping a close eye on the area for the next few days, to observe further instances of noncompliance and resistance to handling the area. Additional actions were taken as necessary to hat and to handle confusions and noncompliance.

SURVEY EXAMPLE 6

SITUATION:

HCO needs further data for posting personnel optimumly in two divisions.

QUESTIONS

1. When you need to know how to do something whom do you ask?
2. Who gets the most done?
3. In the div whom do you feel the most secure about?

RESULTS:

The most upstat of the two divisions answered the questions as follows:

Majority Tone 4.0

1. When you need to know how to do something whom do you ask?

   My immediate senior.

   A reference book.

   Figure it out myself.

2. Who gets the most done?

   We all do!

   Our division.

   The same for all of us.

3. In the div whom do you feel the most secure about?

   Our div head!

   All the guys in our division.

   Myself and the rest in our division.

The less upstat, less productive, low morale division answered accordingly:

Majority Tone 2.0

1. When you need to know how to do something whom do you ask?

   Try to find out for myself then ask the div head.

   Look in a book.

2. Who gets the most done?

   Two of the most junior staff in the division named.

3. In the div whom do you feel the most secure about?

   The div head, then the two junior staff members as named in answer 2 (the department heads not mentioned).

This survey confirmed the success of the productive division as having stable leadership from the division head and staff who were enthusiastic about their jobs, had high morale and were continually training on their posts. The division as a unit worked with tremendous team spirit. The downtone, poor production division had an unhappy senior with downtone unstable department heads. There was no team spirit in this division and little if any post training actions. The most stable terminals in this division were two junior staff members who had enthusiasm for doing their posts and who trained in their study time to increase their abilities.

HANDLING:

HCO then knew (regarding the unproductive division) who to look to for future executive material, and who would then bring this division to a high operating standard. And HCO knew what area to concentrate on most heavily with hatting.

Needless to say, nothing was changed in the productive division. As its production increased even higher, it was allotted additional personnel.

SURVEY EXAMPLE 7

SITUATION:

Some staff members' appearance not up to an acceptable standard. Information needed — the majority tone level on the subject of appearance so that a PR program can be formulated and launched at an appropriate tone level to reach the reality of offenders.

ENCODED QUESTIONS

BE: Do you feel good about having a professional-looking appearance?

DO: How would you like to dress for your job?

HAVE: What would be the advantages of the group being sharply uniformed?

RESULTS:

It was found that staff were strongly interested (3.5) in having good appearance. The main outpoint was lack of uniforms available.

So an enthusiastic campaign to coordinate uniforming of the crew was the answer.

SURVEY EXAMPLE 8

SITUATION:

Personal and org premises not as clean as they should be. Attitude and tone level toward cleanliness required so a suitable PR program to upgrade standards can be carried out.

ENCODED QUESTIONS

BE: Do you enjoy being very clean?

DO: Do you find it more difficult to maintain personal cleanliness on a ship than where you have lived ashore?

HAVE: Is the standard of others' cleanliness, personal and living space, acceptable to you?

RESULTS:

A cross-section survey was done and the majority tone level with regard to cleanliness was 2.0–2.5 (Antagonism to Boredom).

Of those interviewed, various justifications were given by those who didn't keep clean, and these people even admitted they were justifications. Some even admitted to pure laziness.

Among those surveyed who *do* keep clean, there was the desire to be clean.

Several "uncleans" invited stricter discipline to keep the standards up.

Therefore what was wanted and needed was more 8-C. The PR program thus derived was firmer HCO enforcement of hygiene and cleanliness. This was a successful campaign with good results.

SURVEY EXAMPLE 9

SITUATION:

Wherewithal — staff members not adequately aware of their responsibility for org viability and income.

Reality and tone level toward this subject need to be established so further action can be taken to educate staff on the subject of org viability.

ENCODED QUESTIONS

BE: How do you feel about the group making its own way?

DO: What can be done to ensure the group has lots of money to work with?

HAVE: When do you think you'll be receiving full bonus awards?

RESULTS:

The average tone level of those surveyed was 3.5 (Strong Interest). There was a high degree of reality and agreement that the group make its own way.

To support this agreement, the recommendations of a recent B of I on the subject of finance were endorsed. This was to place a 6' x 10' graph in HCO reception showing weekly org income. This enabled all staff to see org viability and to feel more at cause over wherewithal by producing on their own posts.

SURVEY EXAMPLE 10

SITUATION:

Ethics — a general attitude and tone level with regard to the subject of ethics desired.

ENCODED QUESTIONS

BE: How do you feel about ethics?

DO: How do *you* use ethics?

HAVE: What is the advantage of working within a group which has an ethics system?

RESULTS:

Majority tone level on the subject of ethics was found to be in the 2.0 (Antagonistic) range. The human emotion and reaction was found to be toward Courts of Ethics being printed in the Orders of the Day. Reading these notices first thing in the morning in the Orders of the Day was driving many of the crew into tone levels of Resentment, Anger and Fear. In addition, the notices themselves were written a tone *below* the average tone of the group re ethics, which was causing a doubly reverse effect.

Therefore, as a PR measure, the Ethics Officer was informed of this and instructed to print Courts of Ethics on HCO Conditions Orders, not in the Orders of the Day. The Ethics Officer was also briefed on the Tone Scale. From then on Ethics Orders were written up in a conservative manner simply stating the facts with no additional HE&R included.

This was a very successful measure and group morale rose on the whole at least one tone level higher than before on the subject of ethics.

SURVEY EXAMPLE 11

SITUATION:

Execs are needed. Those presently on post are not all capable.

The PR survey questions must detect —

BE: Other *Status*—Status as defense. *Been* something else? IS something else?

DO: Other *Involvement*—Involvement in other things or things that don't matter or involvement in contrary actions to a post. Problems would come up.

HAVE: Scene — omitted or false — what does he know about it, how real are his data? *Representation.*

Execs fall into two categories:

A. Those who will assume the status or forward the doingness or enhance the scene toward ideal.

B. Those who defend status, have other involvement and have an omitted or falsified scene.

Category A build things into a smooth prosperous org.

Category B wind up with an omitted or perverted org.

Sample Survey Questions:

1. What would be the most ideal post to have if you had total choice? Or what type of life best suits you?

NAVIGATE
FIRST PAGE
SEARCH
FIND
AGAIN
EXIT
CONTENTS
ORG BOARDS
INDEX

2. What problems or situations would you find easy to handle? Or, what should you be working on? Or, what are you working on?

3. How are things really in your area? Or, what is the org really doing these days?

QUESTIONS USED

STATUS	1. Is there a post you would like to hold sometime in the future for which you feel ideally suited?
INVOLVEMENT	2. Are you having any problems getting done what you are working on now?
REPRESENTATION	3. How is your org presently doing on an overall basis?

RESULTS:

The results of this particular survey showed the tone level of the org execs to be Grief. In addition, at least half the execs surveyed volunteered that they really didn't want to be an exec at all, but would prefer to be in a worker position.

The WHY of the org's down statistics was neglect of implementing LRH policy, EDs and projects in the org on the part of the execs.

Short-range and immediate handling was to post an LRH Comm in the org who forced in compliance to LRH orders and policy. Long-range handling was to move into exec positions junior staff members who were ambitious to hold an exec post competently, and to move off the unwilling execs into junior areas where they could produce well until ready to again resume a more senior position.

SURVEY EXAMPLE 12

SITUATION:

LRH wrote a test statement of the meaning of Scientology.

A survey was done of Scientologists locally to establish popularity of the statement and check for agreements or disagreements.

QUESTION

A direct question was used. "Please read this statement and tell me what you like or dislike about it."

RESULTS:

For the survey, each sentence of the statement was numbered. On the tabulation, the percentage of endorsements of that sentence or suggestions for its improvement were written beside the number of the corresponding sentence.

Several of the words and phrases in the statement were thus changed or rearranged slightly to make the statement totally acceptable. The amended version was then resurveyed and the results confirmed complete endorsement.

SURVEY EXAMPLE 13

SITUATION:

Population survey. The purpose of this survey—to find out the reality and majority tone level of an entire city so that the org could promote and deliver to this reality.

4,800 people in Boston were surveyed in a few days by several org staff members.

QUESTIONS AND RESULTS:

1. What are you trying to achieve in life?

Happiness	32%
Good jobs—careers	10%

2. What worries people most?

Money	24.4%
Other people	15.1%

3. If these things were resolved what would happen?

People would be a lot happier	19%
Better world to live in	15.2%

   Tone Level = PAIN, ANTAGONISM

The following telex was sent to the org by LRH in response to the survey results:

> "9 Dec. 71 Relay C/O USLO Relay C/O Boston ELATED BY SURVEY. FURTHER DATA NEEDED BUT BEAUTIFUL FOR PCs STUDENTS. LOVE = RON"

THE TONE LEVEL OF ALL THE PROMO WRITING AND PRESENTATION WOULD BE CONSERVATISM = 1 TONE ABOVE ANTAGONISM (the level found by survey).

The Boston Org survey is interesting as it shows a cross-sectional reality level of an entire city. Survey results (reality and tone) would vary in different cities, countries and continents. So each org in surveying its own area would create its promo slanted to a slightly different reality, and the Scientology services offered would correspond to what is most wanted and needed by the public.

SPOTTING TONE

After one has mastered the technique of creating survey questions, the only remaining expertise necessary is accurately spotting tone levels.

The PR man's bible is of course *Science of Survival* and the Hubbard Chart of Human Evaluation and the book *Scientology 8-8008*. These materials must be read and thoroughly understood. Additional references which contain invaluable information for surveyors are HCOB 25 Sept. 71RB, TONE SCALE IN FULL; HCOB 26 Oct. 70 II, OBNOSIS AND THE TONE SCALE; LRH Tape 5505C14, "The Tone Scale"; LRH Tape 5212C05, PDC Lecture 17, "The Tone Scale: Moving the Pc Up the Scale" and Technical Training Films EM 2 and EM 2A, *The Tone Scale* and *The Tone Scale Drill Film*. The way to drill yourself on observing and quickly spotting tones is to do the drills called for in Technical Training Film EM 2, *The Tone Scale* and HCOB 26 Oct. 70 II, OBNOSIS AND THE TONE SCALE.

CONCLUSION

As you can see, the technology of PR surveys and the Tone Scale in handling and controlling human emotion and reaction is an incredibly powerful tool.

By putting this technology to use on a personal basis you can literally be in control of your environment on at *least* the first three dynamics. And Scientologists (particularly Scientology staff members) have a monopoly on the entire subject. If there was ever a way to "win friends and influence people," this is it. We as Scientologists are continually jolted by the primitive nature of the general populace around us. So by establishing the local reality and tone we can at least present ourselves and our product in such a way as to be accepted, and then we can bring people up the scale from there.

Gone are the days of hit-and-miss promo, and by-guess-or-by-god public events. We now have the know-how to hit the exact target every time. We now have, thanks to Ron, another beautiful tool for UNDERSTANDING.

PR SERIES 17

PR AND CAUSATION

Public relations is causative. To be effective it must cause something.

PR is essentially a communications subject and follows the communication formula:

SCIENTOLOGY AXIOM 28

AXIOM 28. COMMUNICATION IS THE CONSIDERATION AND ACTION OF IMPELLING AN IMPULSE OR PARTICLE FROM SOURCE–POINT ACROSS A DISTANCE TO RECEIPT–POINT, WITH THE INTENTION OF BRINGING INTO BEING AT THE RECEIPT–POINT A DUPLICATION AND UNDERSTANDING OF THAT WHICH EMANATED FROM THE SOURCE–POINT.

The formula of Communication is: Cause, Distance, Effect, with Intention, Attention and Duplication WITH UNDERSTANDING.

The component parts of Communication are Consideration, Intention, Attention, Cause, Source-point, Distance, Effect, Receipt-point, Duplication, Understanding, the Velocity of the impulse or particle, Nothingness or Somethingness. A non-communication consists of Barriers. Barriers consist of Space, Interpositions (such as walls and screens of fast-moving particles), and Time. A communication, by definition, does not need to be two-way. When a communication is returned, the formula is repeated, with the receipt-point now becoming a source-point and the former source-point now becoming a receipt-point.

SIGNIFICANCE

Public relations deals mainly in significances.

It uses those channels of communication which convey thought. Some of these channels are the spoken word, word of mouth, TV, radio, cinema, tapes, pictures, symbols, designs, colors, the written word as represented in books, signs, advertisements, pamphlets, handouts, newspapers and various combinations. *Any* channel which conveys thought overtly or covertly is a legitimate channel for public relations use.

PERSUASION

The object of PR is persuasion to think, either newly or differently or to keep on thinking the same way.

Therefore coercion to think in the way required is done by varying ideas persuasively.

INTELLIGENCE

When coercion takes the form of blackmail or threat, PR is no longer PR but has entered the field of intelligence.

VIOLENCE

When the persuasion is attempted by threat of mass violence, it has entered the field of war.

"WHITE" PR

When PR is used for the improvement of things, ideals, conditions or any promotion of prosurvival factors, it could be called "white PR."

BLACK PR

When PR is used for the destruction of ideals or institutions or repute of persons, it is called, traditionally, black PR.

CAUSATION

Thus it can be seen that the person undertaking PR must be causative. He is causing an effect in the field of thought by utilizing the communication channels that are open to him or that he can develop.

He can assign as his source authoritative persons. He can use authoritative channels. Or he can make his apparent sources bear more weight. Use of opinion leaders is a routine mechanism.

He can in many ways, not the least of which is logic, persuade the acceptance and continuance of thoughts he causes to emanate.

KNOWNNESS

In dealing with products or persons in white PR the PR person achieves as his first action *knownness.* This is done by simply repeating continuously on as many channels as possible the identity of what he is representing.

To this basic significance he must attach associated significances that cause the acceptance and understanding of the basic significance which is being PRed.

For this he continues to use suitable channels and develops further channels for his use.

MESSAGE

The thought or significance which the PR person is attempting to convey is called "the message."

The PR person must clearly understand this message himself in order to cause its communication in the many varied ways required.

PUBLICS

The receipt-points of the message are called "publics."

There are many different publics. These are types or groups who accept differently from other types or groups.

It is the task of the PR person to study and separate out the different publics and know what they want or will accept.

It is then his task to couch variations of his message in terms and forms which will be accepted by a particular public.

Unless he knows what to offer each different public his message will not be received.

The common tool of the PR in getting to know various publics is *surveys*.

He has to know the reality, tone and acceptance level of each public he is trying to reach. And use it for that exact public and no other.

IMAGINATION

As a PR person IS operating at the CAUSE point he must be able to IMAGINE.

In other words he has to be able to think creatively and create images.

Without this ability he cannot conceive of various forms of his message or conceive of his publics.

If he is a type who simply records or writes down only what he sees, he will not be able to master PR. If he can *imagine*, he will master PR.

IDEALIZATION

White PR is engaged in IDEALIZATION at all times to a greater or lesser degree.

The better side of life or persons or dreams or hopes is the subject of white PR.

This is true even when the truth of the message is a very high level of betterment or stature. Here the imagination is used to bring the public chosen into a greater awareness of the ideal.

DEGRADATION

Black PR also uses imagination in order to degrade or vilify or discredit an existing or fancied image.

MIDDLE GROUND

Common, ordinary dull statement of the isness of things is hardly classifiable as PR. It is communication of a sort but it is not PR because it is only attempting to *inform,* it is not attempting to *persuade.*

TRUTH

Too glowing an idealization can be punctured when it is a lie.

Too vicious degradation can be exploded when it is a lie.

The only safe ground is to idealize what is already true and when engaged in black PR to degrade what is already bad.

PERSONALITY

The personality of the PR man tends to determine what kind of PR he will do (or not do).

But whether handling white PR or black, the successful PR man or woman must be causative, imaginative, energetic and capable of a lot of fast, hard work.

The middle grounders who, neither bright nor sour, live a dull monotone and see only what they see, do not make PR people.

Taking or choosing photographs or programs, the true PR personality moves things, directs things, combines things until he gets the effect he wants regardless of work. Then he lets it roll. For black PR he will twist things around and put out lights and tear cloth and move garbage until he gets a suitable awfulness. And then lets it roll.

The middle grounder just records or takes what's there and lets it go on — which is not PR.

His however is not a hopeless case. All he has to do is decide to be causative and capable of PR actions. And then do them with a will!

SCENES

The PR deals in three scenes.

The EXISTING SCENE is what is really there.

In white PR the idealized scene is the way he wants the scene to be praised by a public.

In black PR the degraded scene is the way he wants the scene to be condemned by a public.

He can actually raise a scene by idealizing it or degrade a scene by condemning it, at times he condemns the bad to idealize the good. He must know all three scenes whatever he is doing with PR. He must have the scene he wants clearly in view and project it so that it is accepted.

He is lucky when he has a near-ideal scene to idealize or a near-degraded scene to degrade as then he closely approaches the existing scene and is dealing in truth with only changes in emphasis.

SPEED

Real PR has to move fast. The moment and timeliness of an action is so swiftly gone in PR that great speed is required in spotting, developing and executing an action.

Whether pushing for new ideals or social reform a PR has to MOVE FAST.

Because it is all a world of *thought* anyway, the structures put up by PR, the campaigns developed, the situations seen and handled all approximate thought velocity rather than the physical universe.

The time it takes to get something done must not continue beyond the need of the message. If it does, PR has failed.

PR is always seizing the moment and getting in the message. And the moment has a habit of passing.

Thus, speed in PR is essential.

PR could be called the busiest profession.

The speed of a PR determines how many times he can get his subject known and thought about and wanted or approved or disapproved.

This is what really measures success in PR: number of times.

Thus those wanting a quiet life should take up something else.

But for excitement, PR has all the pluspoints whether white or black.

The world is a PR world today.

And PR is a great and useful subject.

HOW TO HANDLE BLACK PROPAGANDA

RUMORS AND WHISPERING CAMPAIGNS

"Black propaganda" (black = bad or derogatory, propaganda = pushing out statements or ideas) is the term used to destroy reputation or public belief in persons, companies or nations.

It is a common tool of agencies who are seeking to destroy real or fancied enemies or seek dominance in some field.

The technique seeks to bring a reputation so low that the person, company or nation is denied any rights whatever by "general agreement." It is then possible to destroy the person, company or nation with a minor attack if the black propaganda itself has not already accomplished this.

Vicious and lying gossip by old women was the earlier form of this tactic and was so bad that some areas put them in public stocks (neck yokes) or drove them out of town.

In modern times there is no such check on black propaganda. Difficulties and costs of libel and slander suits, abuse of press privilege, lay anyone open to such a campaign.

All one needs is an enemy. And there are few men in history who have been without enemies.

There are random individuals in the society who do not understand very much. This is expressed as a sort of malicious glee about things. Such pass on slanderous rumors very easily. In an illiterate society such people abound. Since they cannot read, the bulk of knowledge is denied to them. Since they do not know very many words much of what is said to them is not understood.

This is not isolated to the illiterate only.

What they do not understand they substitute for with imaginary things.

Thus such persons not only listen to slander but also corrupt and twist even it.

Thus a rumor can go through a society that has no basis in truth.

When numbers of such rumors exist and are persistent, one suspects a "whispering campaign." This is not because people whisper these things but because like an evil wind it *seems* to have no source.

Black propaganda makes use of such a willingness to pass on and amplify falsehoods.

Much black propaganda is of course more bold and appears blatantly in irresponsible (or covertly controlled) newspapers and radio and television.

But even after a bad press story has appeared or a bad radio or TV broadcast has been given, the "whispering campaign" is counted upon by black propagandists to carry the slander through the society.

Thus any person, any being is at risk.

No person, company or nation has totally clean hands. That is left to the saints. In childhood one stole a few apples, broke a window or two, dented a fender, went joy riding in a "borrowed" vehicle or took pennies or candy bars that weren't his own.

Childhood is quite lawless and the teenage period is often a revolt against the closer and closer fitting straitjacket of "proper social conduct." One marries the wrong spouse or goes astray with another in some incautious moment, or commits various large and small sins of which society disapproves.

Any of these things tend to make one vulnerable to attack, upon his past or repute.

A person comes to fear bad things being said about him. In the face of a whispering campaign, real or imagined, one tends to withdraw, tends to become less active and reach less.

This is equally true of companies and even nations.

Thus, unless one knows how to handle such an attack, one can in fact be made quite miserable and ill.

THE ATTACKER

The world is full of madmen.

The basic characteristic of extreme madness is perpetual attack, attacks on anything, attacks on persons or things which contain no menace.

Extreme, not petty, crime is at the root of such an impulse.

The attacker has an evil purpose in life. He is a thing of death, not life. And his harvest is a death harvest.

Such a person feels he cannot be safe unless everything else is dead.

His evil purpose takes many forms and expressions. The end product is the same — death.

Where an attacker has gone too far he is himself then attacked. Long bitter quarrels and national wars are alike the to and fro exchange of violence.

Where an attacker lacks the physical means of destroying others and where his own purpose would fail if disclosed, the attacks become covert.

He uses word of mouth, press media, any communication channel to spit his venom. He hides himself as the source, he makes the verbal attack seem logical or real or proven.

He counts on the utterances being picked up or distorted and passed on by the more base people in the society.

This is black propaganda. It is intended to reduce a real or imagined enemy, hurt his income and deny him friends and support.

Companies or associations do this to competitors. The American Medical Association maintains its multibillion dollar monopoly over sickness by continuing a long, well-financed black propaganda campaign against anyone it *thinks* might threaten their income. The head of their "Department of Investigation" (as they call their black propaganda department) once said they just kept it up and kept it up against any rival and one day WHAM! They use press releases, their own members, paid ads, displays, government connections and speakers, any channel, to release endless streams of *imaginary* tales against any *imaginary* rival. While this does bring them government support it has brought them deep hatred not only from rivals but the public at large.

They get back what they put out. They were once wealthy. They are no longer. Their members dislike them and increasingly doctors belong only to state medical societies, not the AMA. The individual doctor most often has good public relations. His main society benefits from this and betrays it. One day, no AMA. WHAM!

So black propaganda is not something one lightly instigates. For it recoils on the person who uses it.

Let us see how it recoils.

Too much venom put out stains one with venom.

Too much black propaganda gets attacks in return.

Black propaganda is essentially a fabric of lies. The AMA simply imagines stories to put out or have put out.

Sooner or later such stories are found not to be true. ONE false story can destroy the credit of the teller. Now who listens?

Thus a black propaganda campaign is vulnerable. The attacker sooner or later is attacked — often by many.

But those who have to counter such a campaign need the technology of how it is handled.

ANY NEWS

There is a natural law at work that unfortunately favors black propaganda.

WHERE THERE IS NO DATA AVAILABLE PEOPLE WILL INVENT IT.

This is the Law of the Omitted Data.

A vacuum tends to fill itself. Old philosophers said that "nature abhors a vacuum." Actually the surrounding pressure flows into an area of no pressure.

It is this way with a person, company or nation.

Hit by lies the person tends to withdraw. This already tends to pull things in.

The person does not then wish to put out data. He becomes to some degree a mystery.

To fill that mystery people will invent data.

This is true of persons, companies or nations.

This is where *public relations is a necessity*.

Essentially public relations is the art of making good works well known.

It is a fatal error to think good works speak for themselves. They do not. They must be publicized.

Essentially this is what public relations is. And this is *why* it is — to fill that vacuum of omitted data.

In the midst of a black propaganda campaign one is denied normal communication channels. The press media along which the campaign is being conducted will *not* run favorable comment. One is mad if he thinks it will as it is serving other masters that mean to destroy the repute of the target.

"Authoritative" utterances push plain truth out of sight.

Thus public relations people have to be very expert in their technology when they confront black propaganda.

THE TECH

When one is not fighting a battle against black propaganda, public relations is easy.

One hires a reporter who gets to work thinking up ideas and turning out releases. That's why reporters are often thought of as public relations people which they are not.

In the face of a black propaganda campaign, such releases are twisted, refused and that is the end of it.

There is far more to the art than this.

These are some of the rules that apply:

1. Fill the vacuum of omitted data with factual data.
2. Prove all false utterances heard are lies.
3. Discredit every rumor encountered.
4. Handle the interest level with any utterance.
5. Carefully study out the scene until the exact source is located.
6. Use the knowledge of source to impede or destroy the source of black propaganda by noncriminal means.
7. Continue to fill the vacuum of no data with good data using any channels available.

Each one of these points could well take a book. But understanding them and using one's initiative one can fill in a lot of the tech himself.

The variations of each one are endless.

1. Fill the Vacuum

First of all, cease to withdraw. It is proven conclusively that in public relations handling of black propaganda, only outflow pays off. Saying nothing may be noble in a character but it is fatal in public relations. Yet even "experts" advise it (when they are doing their clients in).

Blunt denial is crude and can be used against one as a sort of confirmation.

You don't have to announce or spread a flap and never should. PR men often *make* the flap.

But don't interpret this as "silence is necessary." Get in a safe place and speak up.

Use any channel to speak up. But don't seek channels that will corrupt what you say in repeating it.

Don't stay on the same subject that you are being attacked on.

An example of speaking up without denying and thus confirming might be:

STATEMENT: "I read your company went broke last month."

REBUTTAL: "My god. You're telling me! If we hadn't got out of that contract we really would have gone broke. There was a hell of a row in the boardroom. But McLinty won. Scotch to the core. He said, 'I won't sign it!' Like to have tore the president's head off. Hell of a row. Seems like we got 80 million buried somewhere and McLinty is in charge of it and he won't *move an inch* on it."

The interrogator's conclusion is you're not broke. He's got data. The vacuum is filled with a story of board rows and 80 million mysterious reserves.

2. Disprove False Data

The technique of proving utterances false is called "DEAD AGENTING." It's in the first book of Chinese espionage. When the enemy agent gives false data, those who believed him but now find it false kill him — or at least cease to believe him.

So the PR slang for it is "dead agenting."

This consists of disproving utterly the false statement with documents or demonstration or display.

One has to have a kit (a collection of documents) or the ability to demonstrate or something to display.

STATEMENT: "I've been told you are in trouble with income tax people."

REBUTTAL: "Here's a document of fully paid taxes and a letter of commendation from the tax authorities." Displays same.

Result? Whoever told him that is now dead with him as an accurate informer.

The *best* way to dead agent is when the person makes some disprovable statement, find WHO to fix his mind on it and then produce the rebuttal.

STATEMENT: "I hear you aren't married to the man you're living with."

REBUTTAL: "*WHO* told you that?"

STATER: "I forget."

REBUTTER: "Well, you remember and I'll show you some proof."

STATER: "Well, it was a man . . ."

REBUTTER: "WHO?"

STATER: "Joe Schmo."

REBUTTER: "Okay. Here's my marriage certificate. Who's the Joe Schmo nut anyway?"

Now it's Joe Schmo who's the mystery. How come he lies? What's in it for him?

When one hasn't got the document but can get it, one can say, "You tell me the name of whoever said that and next time I see you I'll show you something *very* interesting about it."

And be sure to get the document and see him again.

Dead agenting has a billion variations. "It won't fly." Fly it. "Place is empty." Show him it's full.

The subject matter of dead agenting is PROOF in whatever form.

You only challenge statements you *can* prove are false and in any conversation let the rest slide.

EVERY FRIEND, EVERY OPINION LEADER, EVERY STAFF MEMBER YOU HAVE SHOULD BE SUPPLIED WITH A DEAD AGENT PACK CONTAINING PROOFS AGAINST COMMON RUMORS (AND BROCHURES AND COACHING TO FILL THE VACUUM).

3. Disprove Every Rumor

Proving negatives is almost impossible. "How do I know you aren't a CIA man?" Well, how can one prove that? One can't whip out a KGB badge as that would be just as bad. No one ever wrote a document "Bill Till is not a member of the CIA." Useless. It is a denial. Who'd believe it?

Sometimes "You don't" works.

But the right answer to a negative (no proof) is a "fill the vacuum."

STATEMENT: "How do I know you're not a CIA man?"

REBUTTAL: "Christ, please don't insult me! The CIA tried to hire me once. Said they'd shoot me if I didn't join up. Cuba it was. I was a sugar salesman. And Batista was trying to . . . , etc., etc. See this scar on my leg? (Pulls up pants.) Batista cop shot me because he thought I was CIA. So don't bring up painful subjects. (Rubs scar.) (Laugh)"

But once in a while you *can* prove a negative. Accused of drug smuggling one can show he's a member of the antidrug league. The counter in a negative proof must be *creditable.*

A million million variations exist in dead agenting.

The basis of it is NOT to be the thing rumored and to be able to prove it fast.

4. Handle the Level

Handling interest level is basically an exercise in the Tone Scale. (See Tone Scale Charts of Human Emotion.)

Agreement occurs at the same emotional tone level as the person making the statement. He buys his facts at that level.

To go half a tone up from his level is to command him within his zone of reality.

STATEMENT: "It's hopeless trying to believe in anyone. I thought you people were all right but now I hear you are all hippies. (In a dull apathy.)"

REBUTTAL: "Oh, oh, oh, who could have told you such a sad lie. (Sob)"

STATER: "Wouldn't be any use to say."

REBUTTER: "(Sob) But you've got to say. Oh, I feel so awful."

STATER: "Well, he wouldn't care if I told. It's the local minister."

REBUTTER: "(Sob) (Kleenex) What an awful thing to say. Just because we found him dead drunk and took him home to sleep it off and he said if we ever told he'd say we're hippies."

STATER: "What a sad story. Oh, it's a bad world. How ungrateful."

You go half a tone up. Give him a story, on the subject or not. Like "(Sob) That's because we lost our instruments. We once were a band and this nightclub owner wouldn't pay us and we had to sleep in the barn (sob) . . ."

Another one.

STATEMENT: "I hear some bad things about you people. (Covert hostility)"

REBUTTAL: "(Anger) Who would DARE say such things?"

Etc.

And story type can be matched in tone.

STATEMENT: "I hear those people stole some rowboats."

REBUTTAL: “Who said so?”

STATER: “The dockmaster’s son.”

REBUTTAL: “Oh, him. Gets things wrong. *Our* rowboat was stolen! With all the gear in it. We were out fishing and . . . say, you don’t suppose HE stole it do you? Did you ever hear of him stealing anything? Has he got a record?”

Well, this dockmaster’s son will now “have a record” in the stater’s tales. As *theft* is of interest to him, crime will also be.

5. Carefully Study Out the Scene

The technology of finding who is shooting is very vast. But the core of it is FILING.

All PR is expensive in time or money or both. And nowhere is it more time-consuming than in locating the source of a black propaganda campaign.

But, to live at all, one has to engage in this search at some time or other.

One just keeps running down these tales until one locates the source.

There can be more than one *apparent* source and these can be handled. But they will at last lead to the real instigator.

One just keeps locating names and filing them, with dates.

At length one name file is very thick. That’s your boy — or association or company or nation.

6. Impede or Destroy

As you have been dead agenting as you looked, the attacks get handled. The campaign ebbs and flows but actually lessens.

There are thousands of variations on finding the real WHO.

But essentially it is just looking, dead agenting, filing, looking on and on.

You are, in this whole period, *handling*.

Once in a while it happens fast.

Now and then the black propagandist packs up and fades away before he is fully spotted. He becomes aware of the counteraction.

The usual action is a counterpropaganda campaign *based on truth.*

It is a long-to-find and hard-learned fact that people who engage in black propaganda have big bursting crimes to hide.

They do not have *little* crimes. They have BIG ones.

One’s own ability to confront evil may be too low to really grasp the black propagandist’s crimes or believe they exist.

Such people are often sanctimonious hypocrites. They are usually arrogant and will not parley (have conferences with a foe). They appear so terribly sure they are RIGHT that it fairly shakes one's confidence that they could ever do anything wrong.

Thus the black propagandist is not detectable as such in many cases. The lordly institution, the lofty society, the glittering country are far, far above such a nasty psychotic trick as a studied, financed, expertly run campaign of vicious lies.

Thus they are believed. Or their servants are believed. And their campaigns can be *very* effective.

But this makes them hard to suspect or detect. And it makes it hard to get anything bad about *them* believed.

But under all this are *real* crimes. Not stealing apples or pinching pennies as a child. *Real* crimes like extortion, blackmail, embezzlement and mass murder are sitting in their closets. Believe that. For in the course of your counterattack you may despair of ever finding anything.

But you will find it.

A lofty railroad — but secretly murdering anyone who opposed their land grabs. A minister of high renown — but a secret member of and taking orders from a murder mob. The biggest and "most respected" union leader in the country — but a numbered agent of a foreign intelligence service dedicated to destroying the country's fuel capacity and defeating its president!

And each of these engaged in and never were suspected of black propaganda campaigns that ruined many lives.

Bad guys tend to get rid of good guys. Sometimes for what they consider good reasons, sometimes for imagined reasons, sometimes because the bad guy just can't *stand* a decent bright person.

But there is no real truth in the bad guys always cause their own downfall. It may come, but it may be far too late to save the reputation or even life of the person being attacked by hidden campaigns.

Therefore it is *vital* to handle the matter. One can't just hope it will all go away. It won't. It will get disastrous to the degree that it is not handled.

The less handling, the more disastrous.

There is another hard-won truth.

ONLY COUNTERATTACK HANDLES.

The fact is that just going on PRing oneself does not remove the effects of the campaign and all too soon one no longer has communication lines left in order to handle anything since reputation is so destroyed no one will listen and no lines remain.

One has to fill the vacuum of the counterpropagandist's evil deeds. As these are never exposed to view there is a vacuum there.

Another strange thing is that press *will* print attacks. Maybe this will no longer be true in some enlightened age. But in this era, good attacks or fights between things will get print space.

But press is *very* far from the only channel of communication. Governments do believe the press and think it is public opinion. A newspaper can be a fortress of some black propagandist. But a people often believes little it reads.

There are opinion leaders, there are letters, there is word of mouth. These are also channels of communication and really far more powerful than the press.

There is also friendly press. But a friendly talking reporter is often the most suspect. He was so nice in the interview, so vicious in his article.

Statements one makes can be curved. "She had a birthday party" becomes "The delinquents in her circle gathered yesterday for a sex orgy and pretended to the police it was a birthday party. No one was jailed."

The brand of black propaganda is very easy to see in writing twists.

So it takes time and work to reverse an attack because normal channels have to be reopened and reversed.

It is done by attacks.

But attacks which are not true earn suits. So one must attack only on proven ground.

This requires a lot of hard search.

However, a black propagandist often has *many* other enemies. These have sometimes gathered data.

The principles are that when the subterminals are located, they are investigated and counterattacked. Then further investigation reveals closer terminals to the propagandist and these are attacked. In short, one investigates and attacks.

Always be ready to parley—that is have a conference and settle it. The arrogance of the black propagandist often forbids this. And when it does, it means longer and harder work and if well done, his downfall.

In any event, the attack is a long cycle, a complex cycle and often an expensive cycle. It consists of investigate and attack.

But remember, one *must* attack once he has any idea of the identity of the black propagandist or even his subterminals.

There is no other way out.

Any other course is death.

7. Continue to Fill the Vacuum

Continuous good works and effective release of material about one's good works is vital especially in a black propaganda war.

One cannot just fight.

You are in effect advertising the other fellow when you expose him repeatedly. This gives you a new sort of vacuum. One becomes known as the fellow or company or nation that attacks _____. But who really is this fellow or company or nation?

Pamphlets, brochures, press releases, one's own newspaper and magazines, one's own contacts with opinion leaders, these and many more, must be supplied with A COMPREHENSIBLE IDENTITY OF SELF.

Distributing or using these one publicizes one's own good works.

And one must also *do* good works. One can't just dedicate his life to eradicating the enemy, even when that is tempting.

On the other hand, within the dictates of safety, one cannot hide continuously. One must, through his good works and actions at least, be visible.

So a continual truthful and artful torrent of public relations pieces must occur.

Then one day there is no enemy.

And one's repute is high.

There may be other attacks but now one can handle them as small fires and not as a whole burning forest.

WHAT IS BLACK PROPAGANDA?

You can see that black propaganda is a covert attack on the reputation of a person, company or nation using slander and lies in order to weaken or destroy.

Defense presupposes that the target is not that bad.

One does not have to be perfect to withstand such an attack, but it helps.

But even if one *were* perfect it would be no defense. Almost all the saints in history have been subjected to such attacks. And most of them died of it.

The answer is PR TECHNOLOGY SKILLFULLY APPLIED.

To be skillful in anything, one has to know it and be experienced in it and DO it.

As weary a task as it may seem to some, as heartbreaking as it can be, one still has to *fight*. And fight with tools and technology and dedication superior to that of the enemy.

But progressing and getting small gains, small penetrations, small little skirmishes and battles one at length comes up to victory after victory and at last wins the whole war.

One is saved.

DOCUMENTATION IN HANDLING DISINFORMATION

(Cancels and replaces HCO PL 20 Sept. 88, PR Series 32, DOCUMENTATION AND THE DA CAPER.)

(Taken from an LRH briefing of 30 July 70, "A Succinct View of PR.")

Refs:

HCO PL	11 May 71 II	PR Series 7 BLACK PR
HCO PL	21 Nov. 72	PR Series 18 HOW TO HANDLE BLACK PROPAGANDA

There is a two-thousand-year-old Chinese book by Sun Tzu, who writes about the art of war. He says there are several kinds of agents; one of them is the disinformation agent. Sun Tzu doesn't call him that. The agent feeds false reports to the enemy. Sun Tzu refers to him as a dead agent because if the enemy finds out that they are being fed false information, they kill him or at least cease to believe him. And therefore he is a very insecure agent.

Now that is our only and our sole method used at this time in handling disinformation files as they are spread around — to show the information false. That is the *correct* procedure. You document the falsity of the information. You document it conclusively to show that the report is false and every time we have done that we have succeeded.

If a PR is faced with some odd crack or some peculiar question he would be in *violent* contradiction to policy if he tried to explain this away or brush it off or meet it with a lie. You want to know who told him and you want a document that controverts what is being said. You go ahead and get this documentary controversion. You say, "I'll be right back," and you go and get the documentary controversion. Now you have dead agented his informant (he won't believe him again) and if you can find out who, you have run back the SP.

This is the tech by which we handle these things. You have no business, if you are on PR lines, not knowing these two pieces of tech, because that is all we ever use.

By finding out who told him, you are following the SP policy. Now you can trace this back. And on the other one, follow the dead agent policy.

Now sometimes you have to think fast how the devil you could pull up some kind of a certificate that calls this a total lie. And that is the way you think. That is the think. *THERE ISN'T ANY OTHER THINK ON THIS.*

It takes some wit; you have to be familiar with the dead agent caper, familiar with it to a point where you think in those terms. You have to be familiar with SP policy to a point where you automatically *think* in that direction. It is not enough to have casual, nodding acquaintance with these sorts of things.

Somebody tells you an outrageous lie that has been reported to him — you must think right away, "How do I dead agent this?" What document would it take to knock this out?

Some countries can get upset. And when they get upset they get active. And when they get active they consult their information files. And when they consult their information files they drag out the darnedest lies that anybody ever heard of. A PR's defense against a false report is to pick it up early and stamp it out early by documentation.

And we counter it with a *minimum*. We never give it a maximum hit, we always give it a minimum hit. If you have twenty-five documents, use one.

If you find some whisper coming up of a particular character (SP), your technique is: Find out who? Who? Who? Run it back.

And when dead agenting, we want the minimum documentation it will take to knock the guy completely into total falsity.

Sometimes it takes a little thinking, but because their lies are so outrageous they are very easily countered.

This is the technique on which we operate, this is the technology on which we operate. You better acquaint yourself with SP policy from beginning to end, the HCOBs, so that you know it inside out.

And you will have it made.

PR SERIES 19

THE SAFE POINT

(Taken from an LRH briefing of 1 Dec. 72 aboard the flagship *Apollo*.)

Ref: HCO PL 21 Nov. 72 PR Series 18
HOW TO HANDLE BLACK PROPAGANDA

Under "Application" of Rule 1 (Fill the Vacuum) of PR Series 18, the instruction is given: "Get in a safe place and speak up."

It is necessary of course to have a safe place to get into, from which one can in safety speak up.

One cannot defend himself in a point that has no defenses.

Without some consideration of security in the first place, any attempt at PR area control is folly.

Thus the safe point takes consideration over active defense.

One can be in the situation of attempting to sell and deliver a product or service and suddenly find it necessary to defend himself in the same place from attack. The attack can make the point dangerous to such a degree it becomes impossible to deliver from. One might even be forced to act from a totally hidden point.

Thus the safe point takes consideration over active defense but takes even greater consideration over delivery operations.

Where possible, PR area control makes the point safe for the production activity, before any production occurs.

Sometimes funds are lacking to expand over a long period on a nonincome-producing PR area control operation. In this case one is forced into production to make money.

Whenever it is necessary to go into delivery operations without the prior step of making the safe point, a special unit must be set up and run at full steam to *make* a safe point and gain *viable* PR area control over all publics in the area.

PREPARING THE SAFE POINT

You cannot operate without a base to operate from. You cannot deliver without somewhere to deliver it. You cannot sell what you cannot deliver.

The optimum action is to send a PR area control team to the area you want to operate in, and have it establish PR area control *first*.

A new group or company should be established first as a safe point and *then* as an operating point.

There is a formula here just a hair lower than Non-Existence: "Find a point from which to put out a comm line."

The PR area control action in a new area can go so far as to create in the area a whole past and future track for the activity being established. It can make it sound old-established, stable, reliable, expert, productive, and with continuing expansion before it — when the delivery activity arrives and gets into operation.

Everything that accompanies an actual delivering unit is put there. Except the delivery. With established PR area control, delivery is put in, without a ripple, and it is all perfectly natural and acceptable.

BASIC ESSENTIALS

The most important action to undertake when going about making a safe point is to carefully and painstakingly find out who exactly are the top dogs in the area in financial and political circles, and their associates and connections, and to what each one is hostile.

A handful of allies with impressive sounding titles and positions is not enough. Viability depends on having all areas and persons who could affect or influence the operation under PR control. Most important are the groups who survey out to be the key, real powers in an area. These persons may or may not be those who occupy high political or social positions. They may or may not be the titular heads of large economic concerns. Research and survey alone can determine this.

One must *learn* carefully his p's and q's with regard to these people and take care not to step on their toes. Otherwise one can get tromped on hard, and will. This data must be learned and USED.

Without a safe point established as above, it is a waste of time to rush into dealings with a government or to promise them anything. It is too easy to step on hostile toes and to arouse suspicion of you or make you difficult to account for. Build your PR area control on a well-researched, surveyed and solid gradient.

To maintain your safe point when you have started delivery, it is vital that you be able to detect the SP/PTS character(s) on your delivery lines and HANDLE him, be he high or low in station, and get him out of the road. One such person acting against you in the midst of your safe point can undermine it totally.

One of the reasons for this is that violations of study tech in a person's education can turn him into a seething mass of BPC. This is *very* easily stirred up by an SP or PTS, and at the slightest chance he will do so. A whole class can explode like a powder keg, and with it the safety of your delivery point and its whole PR area control.

Thus SP/PTS tech is a basic tool of PR area control for the operating activity.

Delivery of excellent results is of course a vital necessity in any activity, no matter what the degree of PR area control, once it is established.

Follow this procedure to make a safe point, and the rules of PR Series 18 to make it safer.

But make it safe *first*.

PR SERIES 20

THE UNTRAINED PR

An untrained PR will do at least two wrong things:

1. He will waste events and materials and

2. He will not only not handle existing situations, he will create new ones.

PR is a real technology. Until he studies it, a person may not realize it.

Therefore people who are "in PR" must be called and must sign themselves I/T until such time as they have studied the full approved text and done the most recent PL full PR checksheet and its practical and have had some apprenticeship.

Life is rather hard for the trained PR who has to work with the very untrained as he is likely to be kept busy correcting or creating new materials that are then wasted and handling stupid situations generated in the name of PR.

The real pro has a right to insist that anyone on his lines "helping" or "assisting" or holding PR posts GET TRAINED. That they put their seat on a student chair and do the course thoroughly.

It is easier to do this than to be worked half to death without getting PR products out of juniors.

This applies to Public Div Secretaries, Port Captains, PR officers, photographers, artists, magazine editors and makeup people and anyone directly concerned with PR.

GET TRAINED!

PR SERIES 21

WASTED PLANNING

It too often occurs in PR that the planning of several capers (PR events or actions) comes to nothing.

This can be the planning of four hard news (events rather than statements) stories or six future issues of a magazine.

The trained PR outlines it all quite plainly.

Then the debacle.

In execution by untrained juniors the four hard news stories become one and the one is presented badly in the wrong place. The six magazine issues become one handout.

Why?

Well, it's Data Series No. 1, THE ANATOMY OF THOUGHT, HCO PL 26 Apr. 70.

It is also in Book One, *Dianetics: The Modern Science of Mental Health:* A=A=A.

The junior conceives things as identical which are in fact only similar or even very different.

It might not be realized by the trained PR that people are sometimes incapable of differentiating.

To the untrained and aberrated "helper," the capers are all alike even though one displays a burning building and another the birth of twins; the magazine layouts were all identical to each other even though one was for winter complete with Santa Claus and snow and another was full of bathing beauties and sunburn.

Instead of going purple about it, the right answer is to point out simple differences to the "helper" so that he spreads out his tendency to identify everything with everything.

If you do this well you will get understanding cooperation in most cases.

HCO PL	23 Sept. 88R Rev. 10.9.2000	PR Series 40 NAMES AND THE LOCAL ENVIRONMENT

ESSENTIALS

The *absolute minimum* essentials for a press conference are:

1. An originated idea, a gimmick, which will be picked up and used and is the "reason" for the conference. This "explains" or gives reason or gives a news item or a hard news (visible action rather than a statement) display performed. But even with hard news there is also a gimmick, an idea, a novel twist. This is the test of a real pro PR. Can he originate (dream up) an acceptable newsworthy gimmick.

NAVIGATE
FIRST PAGE
SEARCH
FIND
AGAIN
EXIT
CONTENTS
ORG BOARDS
INDEX

2. A handout, mimeoed or *many* typed copies. This gives all essentials and is a smoothly written news story in itself. It gives the gimmick. It gives all proper names. It gives all data the reporter or paper needs. It also explains away possible sticky points that will come up. One doesn't expect the reporter to print it verbatim (word for word) but it could be and a friendly reporter might do just that. A conference without a handout is like an empty coffee cup offered to a guest. It insults. It is a grave error to omit one.

3. A press book is vital. This contains photos and clippings of the client. See HCO PL 18 Mar. 74, PR Series 23, THE PRESS BOOK, for a description of one.

4. A proper target for the conference and all extraneous or wrong target subjects omitted or fended off.

5. A DA pack which proves by authentic document that any hostile ideas or stories being circulated are false lies. Dead agent packs must be complete for the scene.

   Various PLs cover this subject. The pack contains only copies but contains as well extra copies so they can be handed out. A well done DA pack kills rumors dead and makes fools out of determinedly hostile reporters.

6. Good newspaper photos to hand out that will reproduce.

Given these items, only then can you begin to apply the policy letters on the actual holding of a conference.

If you get hostility or bad press it will be mainly because the points above were not done.

A PRESS CONFERENCE BEGINS DAYS BEFORE IT IS HELD. It begins with the swift and full adherence to the above preparation points.

It goes without saying that an untrained, undrilled PR is dynamite in a press conference no matter what he is equipped with.

So get trained.

Get the tech.

And before any press conference prepare the above points. These are the key to good press.

PR SERIES 23

THE PRESS BOOK

A professional PR who has a "client" always at once constructs a display book. And he keeps it added to and up-to-date.

IT IS VITAL THAT THIS BOOK BE CREATED AT ONCE.

The book is used to get interviews, bookings, press.

Usually it is a loose-leaf big fancy clipping scrapbook.

Such a book begins with an acceptable story of the group creation which is factual and contains itself PR.

There follow press cuttings including photos as in the press. Such press sections go on and on in the book as new press occurs so other data is sandwiched in between expanses of press.

Radio and TV appointments or plays are noted or clipped from papers and pasted in.

Display photos of the group exist in different locations.

Group members are individually photographed and a short *PR* biography (quotable gimmicks) is included for each member. This is material a reporter or interviewer would pick up and use for human interest.

Awards, plaques are photographed well and included.

What they do is described.

In the case of a music group, a cassette player and a sample tape are part of the kit — a piece that shows audience participation.

Several full packs of photos, duplication quality, one of each displayed, are included in the kit. This is so no one tears photos from the book.

Real handbills and posters are pasted in as they occur.

Such a book is a responsibility of any professional PR. A pro never operates without one. He also keeps it up-to-date as a routine action, putting new photos and clippings in it as a day-to-day part of his admin.

The book is *not* created in two or three months. It is knocked together fast and then gradually built fully.

It is of tremendous use and gets bookings and interviews with speed.

That it is fat is a big recommendation in itself.

Usually it and its packs are kept in an attaché case big enough to hold the works.

No *professional* PR or booking agent or advance man is ever without a display book telling of and selling his client.

A group's *popularity* and *usefulness* depend as much upon doing the usual steps (such as a display book) of PR and booking as they do upon the performance itself.

PR is defined as GOOD WORKS WELL PUBLICIZED.

The first public one contacts is usually the person in charge of programs.

This book is what you PR *him* with. If you win there, you are in and have a comm line to the broader public.

Thus a PR or booking man without a good effective display book is liable to miss selling the person who has the key to the door!

So be sure to make and have such a book!

CLIPPING BOOKS

Ref: HCO PL 18 Mar. 74 PR Series 23
THE PRESS BOOK

PRs should keep clipping books of all ads, news stories, photographs and even commercials relating to any one item.

Such books are usually quite large, more like big scrapbooks than press books.

If one keeps such a book for any one item up, one has at once all the materials from which to:

a. quote,

b. make up similar campaigns and

c. analyze the success, or lack of it, of a campaign so as to adjust the next one for a similar item.

Neat PR admin of this character makes a PR's work in the future much easier.

Also, a humongous clipping book, as different from a press book, can be used to make a big impression when trying to convince an editor or manager he is dealing with a commodity that GOT COVERAGE. It can mean the difference between placing new releases or not placing them (or bookings or schedulings).

A maxim that runs in editors' minds is "existing press gets more press — unpublicized items go unpublicized." Sort of daffy, but that's how they think.

A clipping book helps solve this.

PR SERIES 24

SAFE GROUND

1. NEVER SAY OR PUBLISH ANYTHING YOU CANNOT PROVE OR DOCUMENT.

2. ALWAYS DOCUMENT THE TRUTH TO OPPOSE LIES.

These two rules are a PR's safe ground.

Violating them can bring on catastrophe!

About the most trouble that can be caused by violations of rule one is to tell several versions of a tale that then by their own contradiction bring about the collapse of creditability.

On the second rule, letting any lie remain disproven can be a fatal course. Dead agenting — as this is called — is a VITAL PR function.

THE ART OF PR

The art of PR consists of *how* the truth is told and *how* the lie is disproven.

PR is not a dry-as-dust activity. One could follow the above two rules in a variety of moods.

Truth can be revealed in an enhancing way, a dull way, a derogatory way.

Lies can be disproven spectacularly or dully or in a derogatory fashion.

The imagination of the good PR is wholly exercised only in how he is doing rules one and two.

A very bad and dangerous PR exercises his imagination in inventing the "truth" and the disproof of lies. In this way he erects a structure any baby can topple over.

There is NO limit to the amount of imagination a PR can use PROVIDING he does not violate the above two rules.

If this seems a contradiction, let us examine examples.

Statement about the PR's subject by PR: "He drives." "He is a good driver." "He is a fantastic driver." Proof: He wins or has won a road rally. The imagination of the PR is employed in the mood of his statement and in his device to prove. Reversely, he has the proof already, so he can make the statement.

A foolish PR, in violation of rule one, says, "He is a world champion driver." The fact is he had his license revoked for bad eyesight! What a picnic an enemy could have with that!

A lie example would be an enemy statement: "He can't drive." The DA would be showing his twenty-year membership in the AAA and a safe driving award.

A violation of rule two would be a PR hearing an enemy statement "He can't drive" and letting it go by! Or, hearing "He is a reckless driver," showing a news clipping of his subject winning a speed rally!

Imagination plays its role in overall image planning and then selecting what can be proven easily and then building it up.

Also imagination plays its role in rule two in leading a hostile person into uttering lies which can be wiped out by the DA book in the PR's lap simply by opening it. And *then* opening another display that shows the hostile person had lost seven suits for libel and slander he has uttered against others!

There are other ways of applying imagination to rule two. One would be to let half a dozen hostile statements one cannot easily disprove pass (in one debate or article) and leap all over the seventh which *can* be documented as false and then winding the whole scene into a hurricane around that seventh!

But whatever you do, do NOT violate the two basic rules ever for *that* is the road to PR disaster.

PR does not quite follow (as intelligence work does) the rules of warfare. Deception is NOT a legitimate PR action.

The road to Power in PR must be built on a high road of truth.

PR AND INFORMATION

PR brings things to the notice of a public.

In order to do that the PR himself has to notice things.

There is no "ivory tower" in PR.

One has to know what is going on.

To do that a PR has to be on info lines and has to know accurately (not by gossip, which is a public's action).

In writing a release or furnishing a campaign, a PR has to do his homework. He can't rely on guesses or faking the data if he is to succeed.

Information, collection of, on any subject is a first-step must in any PR action.

This *includes* surveys. But there are other sources of info than surveys.

He notices things and handles.

He finds out the data before he acts.

The PR has to be the person in the know.

PR SERIES 26

THE ENEMY LINE

When there is a concerted short- or long-term campaign going on against someone or something from a single or multiple source, there has been a black PR agreement as to what to say about that someone or something.

Some worked-out and agreed-upon entheta is concocted.

The enemy's PRs, media outlets and front groups are given exact statements to make.

There is a maxim in PR or advertising that A MESSAGE MUST BE REPEATED OVER AND OVER TO IMPINGE ON A GIVEN PUBLIC. This is found in advertising as "brand-name exposure." In general PR work it is used to get a client's name repeated over and over. Even in intelligence the same principle is used: they have the same report appear in several places at once. This convinces the opposition of its "truth."

An enemy group usually originates several carefully worked-out entheta statements. You can always trace these as being a *planned* campaign by someone because the same perverted statements appear at widely separated points.

Example: Glutz Biscuits is monopolizing the market. The Weevil Biscuit Company PRs decide to attack Glutz Biscuits and get more of the market. At a meeting, Weevil's PRs decide upon "Twelve Glutz Biscuit employees were hospitalized for rabies." To make press on this they get Gussie Mug to get a job at Glutz, pop some soap in her mouth and get carted off for a rabies test. Gussie's "mother" calls the president of Glutz and confesses Gussie had scratched another employee. The Glutz president has several employees checked for rabies. Weevil PRs tip off the press. The result is a tiny local item "Several Glutz employees were tested for rabies after another employee was hospitalized." Two-line filler. But Weevil PRs now go to town. A citizen's committee angrily condemns Glutz for unhygienic actions. The Health Ministry and local city inspectors are called in and Glutz packages are suspended in stores.

All Weevil Biscuit distributors and salesmen are given the tip-off and clippings. They each are heard to say, "Too bad about Glutz — they had rabies develop in their plant and it has been shut down by the Health Ministry."

Glutz PRs now *deny* that the plant is shut down and say that there was only one case of rabies. The idiots.

Glutz staggers into a ten million dollar loss.

Their error? They FORWARDED AN ENEMY COMMUNICATION LINE.

Glutz could have DAed and should have whenever the subject came up. But never brought it up!

And Glutz PRs should have (a) gotten Gussie to confess it was done by Weevil, (b) promptly done a campaign on Weevil, and (c) instructed their own network to say (a new arranged line) "Did you hear about Weevil trying to buy out Glutz yesterday? What these guys will do for a takeover!"

NEVER FORWARD AN ENEMY CAMPAIGN ON YOUR OWN OR OTHER LINES!

Don't deny rumors for that is what they want you to do.

HAVE A BETTER CAMPAIGN THAN THEY HAVE AND FORWARD IT!

Examples of enemy planned statements re Scientology:

1. "People who should have professional help go to them." (Truth is, those who started this kill people with their "professional help.") Answer: Expose the source as murderous.

2. "Hubbard is a science fiction writer." (This is not too bad as people respect science fiction writers. But it is false. Hubbard only wrote 1,000,000 words of science fiction over a short period and wrote 14,000,000 words on other things. They plug "fiction" to connect it to Scientology. Subtly clever.) A countercampaign might be (the truth) "Hubbard's books on Dianetics and Scientology sell more copies than any other writer about the mind. Every psychology course today tries to include Hubbard's work."

3. "Hubbard is not allowed to enter England." (The truth is that this was rigged while Hubbard was *not* in England and is based on no offenses of any kind, a purely PR action.) A counteraction: "Hubbard is a popular member in a score of English clubs and professional societies."

The enemy line is now very ineffective. It has put itself in the same situation as the Weevil Biscuit Company! It is wide open to attack in every quarter and it opened the door by opening an attack.

Don't be a Glutz PR.

NEVER FORWARD AN ENEMY CAMPAIGN ON YOUR OWN LINES!

THE ONLY ANSWER TO A CAMPAIGN IS A CAMPAIGN OF YOUR OWN.

PR AND WRITING

(Taken from an LRH briefing of 5 Oct. 75.)

Always develop the trick of reading what you do from another viewpoint. I can read one of my own stories from the viewpoint of the editor, the reader and so on. I rewrite and reread it as if I never read it before. One has to shift valence at will. Develop that trick — take the viewpoint of the public you're writing for and read it again.

The first thing a PR has to be able to do is write in streams.

I can tell you how to overcome that — write.

Dish it out and read it back.

A PR is going for terrific quality. Well, what would a PR say to an audience, standing in front of one? He should mock up an audience and communicate. What a PR is looking for is R. It has everything to do with R. If he gets his R up, communication will follow.

POSITIONING, PHILOSOPHIC THEORY

Although Madison Avenue has used "POSITIONING" for some years, it has not fully understood the actual philosophical background that makes "POSITIONING" work.

There is an excellent booklet called: "The Positioning Era" put out by Ries Cappiello Colwell, Inc., 1212 Avenue of the Americas, New York, NY 10036, which has been reprinted and issued as HCO PL 13 Sept. 88R, Marketing Series 24, THE POSITIONING ERA. It is an excellent booklet. It does not, however, give the philosophical background which, probably, is not generally known. Probably it was never discovered. I had to work it out myself.

Buckminster Fuller, an engineer and architect of some renown, says that it is a two-terminal universe. In other words, the universe is built by twos.

In electricity you have heard of two "poles" — the positive and the negative. You only get movement or generated energy in the presence of two poles. That is the principle of the electric motor, why current flows from one point to another point and so forth. There are four possible arrangements of these two poles: they are positive-negative, positive-positive, negative-negative and negative-positive.

In the reactive bank a positive and a negative, when occurring together, tend to bring about a stuck point in time. You sometimes see this in a marriage where the husband is jolly and carefree and the wife is sad and morose. One wonders why these people would ever stay together. The fact of the case is, due to reactivity of the mind, they can't do anything else.

Despite propaganda that "one should live for oneself alone," the fact is that it is very difficult and most disappointing to do so. Life really can't be lived on the first dynamic alone. If you don't believe it go on out in space 300 miles and sit there for a while; you won't like it. You'd be calling Houston every few minutes.

In any event, one could say that life was at *least* a two-pole activity. Actually, it is not only always just two but certainly it doesn't go along well with just one and goes best with several — ask any popular person.

Fast communication is most easily done by comparisons. When one asks, "What is the book like?" he really is not trying to get you to describe the book. He means that he wants some comparison. He will be happiest with the answer if he is told that it is like another book with which he is familiar. It would take you a lot longer and involve you in a lot more arguments if you just tried to describe the book to him instead of comparing.

"What does it taste like?" is satisfactorily answered, "Like candy." That, if it has some shadow of truth and accuracy, is a perfectly satisfactory answer to the other person.

So we get a law which is this:

THE UNFAMILIAR IS RAPIDLY INTRODUCED OR COMMUNICATED BY COMPARING IT TO A FAMILIAR.

Joe knows nothing about practice boxing gloves and there are none there to show him and he will be fairly satisfied if he is given a familiar object, pillows, to compare them to.

Thus, one can achieve a very rapid communication by observing the following law:

ONE CAN ACHIEVE THE APPARENCY OF FAMILIARITY, EVEN WHEN THE PERSON HE IS COMMUNICATING TO HAS NO KNOWLEDGE OF THE SUBJECT OF COMMUNICATION, WHEN HE ASSOCIATES IT IN THE MIND OF THE OTHER WITH SOMETHING WITH WHICH THE OTHER IS FAMILIAR.

Positioning takes advantage of a fact that one can compare the thing he is trying to get the other person to understand with desirable or undesirable objects. Desirable objects are now more commonly used in advertising. Undesirable objects are more commonly used in propaganda. By comparing this unfamiliar thing or the thing he wants to sell to another desirable object or by comparing something he wants people to detest to an undesirable thing, he can achieve a rapid communication and comparison.

Further advantage is taken of the fact that one can position *above* a familiar object, *with* a familiar object, *below* a familiar object, *at, to, against* and *away from* a familiar object. This opens the door to an opportunity to establish an opinion of the thing one is seeking to communicate. You might call it an "instant" opinion.

For example, we know that an astronaut is a familiar, highly regarded being. Thus, we position a product above, with, below, at, to, against or away from an astronaut.

We know that people think angels are good, sweet and kind, so we position another something above, with, below, at, to, against or away from angels.

We know people loathe psychiatry, so we communicate something being loathsome by saying it is below (worse than) psychiatry. We could also make people think something was good by saying it was against psychiatry, bad because it would bring them to psychiatry, or awful because it used psychiatrists (like the tax people).

A common use of positioning in advertising is to take a product which, by reason of advertising, is familiar to the public and is regarded by them as the leader in the field and then *positioning* a new untried, unfamiliar product above it, with it, or just below it. Thus the new product gains a sudden spurt in sales by being compared to the leader.

In fact, in the field of advertising this has been the primary use of positioning, probably because no one had carried the idea back to a point of formulating the actual laws of it and thus broadening its use. They thought in advertising, evidently, that the basic theory of it was the "pecking order of hens" which means that the whole barnyard is usually found to have a top hen and a bottom hen and they peck each other in that order.

Apparently, from talking to ad guys, they thought that by putting their products in the pecking order against the top product they made their product higher or just with or just below the top hen. That's what the advertising people get for associating *with* such "experts" as psychologists.

POSITIONING can be seen to have far far broader uses than "cola" and "uncola" ads when you study the above basic PL data. The horizon becomes very very vast and all around because with it you can attain fast communication about the unfamiliar and can formulate "instant opinion."

When used in advertising, posters, write-ups, PR, propaganda or any one of many activities, forceful and effective positioning requires certain requisites:

1. The selection and identification of the public or person one is trying to cause to have an instant opinion, desire or repugnance.

2. Work out whether you are trying to do a good or bad relationship to the familiar object you will find and what kind of an opinion, desire or repugnance.

3. Survey that public with questions which do not even mention the thing you are eventually going to use the survey for to find what they consider wonderful, popular, useful, etc., etc., or awful, terrible, etc., etc. You can survey for attitudes, objects, professions or anything else you have chosen that will even dimly compare with something you are going to use the survey to push.

4. From the majority answer of this survey, choose an object, profession, attitude, etc., etc., that they think is great or awful or whatever.

5. Get a bright idea of how to compare the thing you were trying to communicate to the familiar object, attitude, profession, etc., that they all firmly have an opinion on.

Do as many other surveys as you like of this same public you are trying to reach to get their attitudes in general or attitudes about what you found or even their general

likes and dislikes, vocabulary, habits of dress, etc., so you can write copy and draw pictures that seem to be them or what they would say or do.

Do your drawings and write your copy.

If you have been clever, you will succeed in communicating forcefully and effectively and instantly at a glance something that was very unfamiliar to them previously.

All the other rules of copywriting, art and design, impingement, etc., are dovetailed into this to make more of it.

By doing a lot of practice with this and drill, drill, drill, drill and getting experienced with it, you will suddenly find yourself able to use this in PR, advertising, marketing and communication in general with an impact that will be very effective and very startling.

REPETITION OF MESSAGE

(Originally issued 9 July 79 as an LRH ED.)

One of the essences of PR and promotion is that you have to pound the same message home time and time again.

All issuances (fliers, magazines, posters, etc.) on a certain subject should all go in the same direction and bear a similar message. One is attempting to simply pound home a message. If the message is not smooth, it won't pound home.

DIANETICS AND SCIENTOLOGY ARE NEW

People who have been in Dianetics and Scientology for years see it as a way of life. They accept it.

But to listen to them you'd think Dianetics and Scientology had been around for the last 50 billion years at least!

They have lost their viewpoint of the newness of Dianetics and Scientology.

They do not realize that Dianetics and Scientology are new news to the bulk of the world's population.

They do not realize that the oldest Dianetics or Scientology books are *brand-new* books to the bulk of humanity!

Before 1949 man's knowledge of himself, the spirit and the mind was a black barbarism. Look over the psychology, psychiatric and religious texts of the 30s and 40s. Man could not change. He was a degraded animal. The way you applied therapy was dreams or drugs, ice picks and ice baths.

Only Dianetics and Scientology began the road out of that witch pit.

But the witch pit is still there for almost all the world!

Because Scientologists number millions, Scientologists do not look at the *billions* to whom Dianetics and Scientology are BRAND-NEW!

Those billions are still in the witch pit. They are still boiling.

Dianetics and Scientology are NEW NEWS.

We are the only road out.

Just because YOU are making it is no reason the world will. (If you *aren't* making it in auditing, if you are a "failed case," get yourself a repair — Scientology is the only approach ever developed that repairs itself too! And that is also new news!)

	Rev. 26.12.2000	POSITIONING SURVEY TIPS

The following is the text of a little booklet on "Positioning in PR" which is quite good. It belongs in the PR Series. It is written by Al Ries and Howard Geltzer and published by Ries Cappiello Colwell, Inc. in the 1970s.

POSITIONING IN PR

Anybody who reads a magazine or watches television today has to be aware of positioning.

Campaigns like The Uncola, The Third Newsweekly and The Other Computer Company have radically changed the way the advertising game is being played.

Just as Jack Trout and Al Ries predicted in a series of articles written for *Advertising Age* in 1972.

Today, positioning has become a buzzword in advertising and marketing circles. The subject of many speeches and articles.

WHAT IS POSITIONING?

You can demonstrate the basic principle by asking yourself a few questions. Who was the first person to fly solo across the North Atlantic? Charles Lindbergh, right?

[*Editor's Note:* A glossary has been included as an attachment to this issue to provide definitions for specialized terms used in the text which might otherwise be difficult to find.]

Now can you name the second person to fly solo across the North Atlantic?

Not so easy, is it?

What's the name of the highest mountain in the world? Mount Everest in the Himalayas, right?

Now, what's the name of the second highest mountain in the world?

The first person, the first mountain, the first company to occupy the position in the prospect's mind is going to be awfully hard to dislodge.

IBM in computers, Hertz in rent-a-cars, Coca in cola.

If your company or brand is not the first to occupy the position in the prospect's mind, then you have a positioning problem. You must relate to the leader's position if you hope to make progress. This is the essence of positioning, one of the most useful tools ever developed for coping with marketing problems.

WHAT ABOUT PUBLIC RELATIONS?

In spite of its overwhelming acceptance by the advertising community, it's possible that positioning will prove to have an even greater role in public relations.

The reason is obvious. Positioning is essentially an "against" strategy. That is, you normally position your company or brand against another.

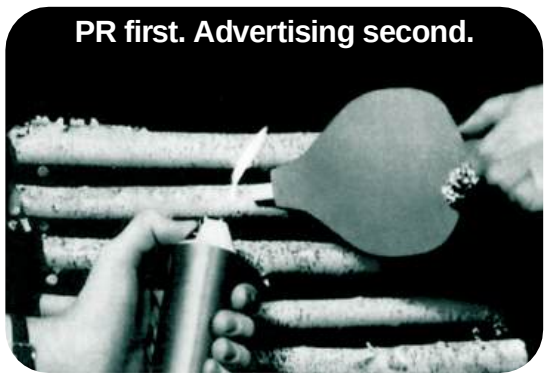
And as every editor knows, what you stand for is not news. What you're against is the thing that makes news. (Ralph Nader became famous not by advocating safer cars but by singlehandedly attacking the world's largest corporation.)

Being against some thing or idea or concept (not necessarily another company) is an equity that can be translated into publicity coverage. Editors encourage controversy and so do readers and viewers. Controversy is a tool that can drive your message into the mind. Never be afraid to exploit it.

In the past, however, many PR programs have not been effective from a marketing point of view. And it's easy to see why. In PR, your inherent lack of control of what is being printed or said about you often leads to a lack of direction. (The discipline that positioning can bring to a publicity program can make an enormous difference in results.)

To make positioning work in PR, however, the emphasis has to shift from "getting your name in the paper" to achieving marketing objectives.

(Many prominent companies do not need more exposure. They need less, but better-directed exposure in the media.)



In the PR business, anonymity is a resource. It can easily be squandered by too much publicity. An unknown company with an unknown product has much more to gain from PR than an old company with an established product.

"You never get a second chance," someone once said, "to make a good first impression."

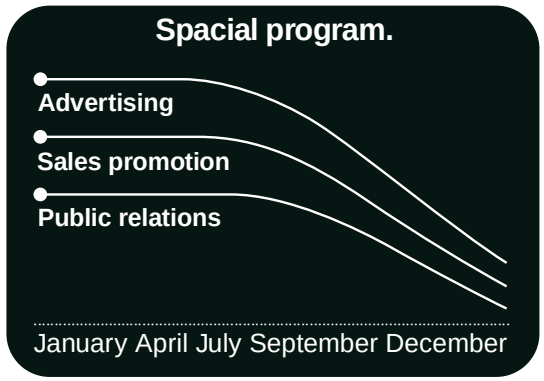
Publicity is like eating. Nothing kills the appetite quite as much as a hearty meal. And nothing kills the PR potential of a product quite as much as a premature feature story. Or a misdirected television placement.

WHAT ABOUT ADVERTISING?

Since unplanned, untimely exposure dulls the publicity potential of a new product or concept, it's easy to see that advertising has to be carefully handled if a company wants to take maximum advantage of PR. Never to run ads until the major publicity possibilities have been exploited.

The general rule is: publicity first, advertising second. (PR plants the seed. Advertising harvests the crop.)

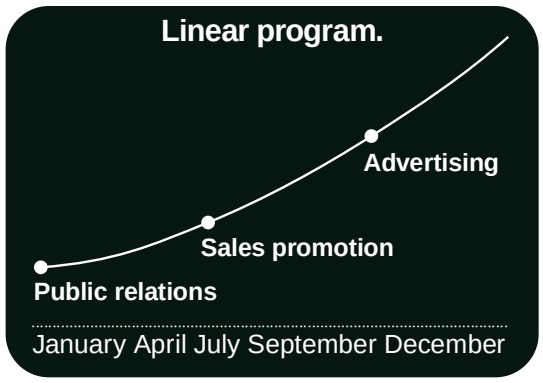
The truth is, advertising cannot start a fire. It can only fan a fire after it has been started. To get something going from nothing, you need the validity that third party endorsements bring. The first stage of any new campaign ought to be public relations.



When a company is using positioning as its basic advertising strategy, then it just makes sense to use positioning strategy in PR. Especially since the PR ought to precede the advertising.

Too often, this never happens. Advertising agencies and public relations agencies see themselves as competitors. For the client's ear and his or her dollar.

This intramural rivalry saps the strength of many product and corporate programs. The advertising runs too soon and kills much of the PR potential. And the PR lacks a positioning concept so it doesn't set up anything that the advertising can exploit.



What's needed is a basic change in the way advertising and public relations programs are planned. Programs must be developed that are linear rather than spatial.

QUICK BANG VS. SLOW BUILDUP

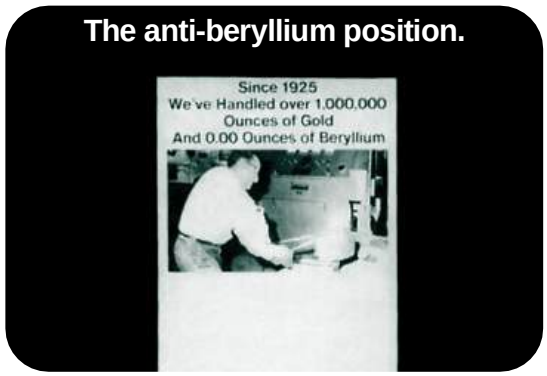
In a spatial program, the elements start together, but in different space. (Public relations, advertising, sales promotion, etc.) This is the typical way most programs are conceived. The quick bang, if you will.

But when the smoke clears away, when the excitement of the initial launch is over, nothing usually has been changed. The prospect's attitude is the same as it was before.

In a linear program, the elements unfold over a period of time. The advantage, of course, is that they can be designed to work together to reinforce each other. The slow buildup that leads to a big change in the prospect's mind.

The trouble with most spatial programs is that they don't go anywhere. There's no buildup, no climax, no unfolding of elements, no drama, no "what's going to happen next" excitement.

Which is why the beginning of a new year usually marks the start of a new spatial program. With new objectives, new strategy, a new advertising theme.



This annual changeover is just the opposite of good positioning strategy. More than anything else, successful positioning requires "consistency." You must keep at it, year after year after year.

A linear program helps you achieve this consistency. The gradual buildup of an idea or concept allows plenty of time for the public relations portion of the program to be developed to its fullest extent.

Linear thinking could also shift the emphasis from advertising to PR and reverse the roles that advertising and public relations agencies play in the development of marketing strategy.

The four examples that follow demonstrate some of the ways that Ries & Geltzer uses positioning in the public relations field.

THE ANTI–BERYLLIUM POSITION

For Leff Dental Golds, Ries & Geltzer has developed a marketing communications program that positions the company against beryllium.

The background: Spiraling gold prices have encouraged many refiners to develop alloys. One of the most popular combines gold with beryllium.

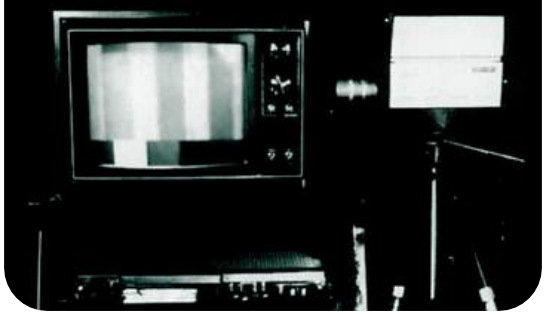
According to some scientists and physicians, however, beryllium when inhaled by laboratory technicians, dentists and patients has dangerous side effects.

For Leff, the agency developed statements and articles about beryllium which appeared in the trade press.

Speeches, brochures and advertisements expanded this anti-beryllium position in moderate, unemotional explanations of the hazards of the metal. Result? Leff Dental Golds is positioned as the one company that rejects price in favor of safety.

THE SERVICE POSITION

The service position.



Colgate-Palmolive has developed a marketing strategy that sells products and helps youngsters by providing funds for school projects. National groups like Boy Scouts, Girl Scouts, 4-H Clubs also benefit.

One of their programs is the School Action Plan, where youngsters, working through their schools, collect Colgate labels and box tops. Colgate sends cash, and the funds are used for worthwhile school projects like band uniforms, class trips, athletic events, etc.

Ries & Geltzer communicates news of the School Action Plan. We also publicize the efforts of enrolled schools in local media. Public relations techniques have helped schools raise hundreds of dollars for projects where funds would not otherwise be available.

THE PRACTICAL POSITION

The practical position.

For Sony, one marketing objective was to reach executives in every business category with a basic message: That the U-Matic Videocassette System was a practical, simple, economical and versatile tool for their own specialized problems.

Advertising in each category was prohibitively expensive. Consequently, Sony concentrated its advertising in general business and video publications and its product

publicity in vertical magazines to tell prospects how the U-Matic can be used in their specific fields.

Ries & Geltzer interviewed hundreds of Sony customers, prepared articles about the more interesting and newsworthy case histories and placed them as full length features in a wide range of publications in industry, education and medicine.

THE NON–ADVERTISED POSITION

The non-advertised position.

The laundry detergent field is an overcrowded jungle of heavily advertised products (to the tune of $120 million a year, most of it on television).

With advertising, it would obviously cost Witco Chemical a lot of money to launch an unknown brand in this media-saturated marketplace.

Instead, Witco hired Ries & Geltzer to introduce Active, the first non-advertised national brand of laundry detergent.

The non-advertised position became the news slant for an intensive public relations program to communicate with consumers and consumerists groups. Feature stories appeared on women's, food, living and business pages of daily and weekly newspapers throughout New England, the first market in the national rollout.

An articulate home economist was retained as Active's regional consumer spokesperson.

Appearances were booked on radio and television talk shows. Speaking engagements were arranged before women's, service, religious and consumer organizations. Visits were planned to supermarkets where she met and spoke with consumers and passed out coupons.

The result? In the first three months, Active achieved 80 percent supermarket distribution. More than 1.5 million New England consumers were reached through the media.

In the execution of a positioning PR program, there are many traps that can catch the unwary. Here are four examples of the most common ones.

THE COLUMN–INCH TRAP

Public relations is hard to measure. The most widely accepted method is the avoirdupois approach. Clippings are collected and submitted to managements. Content is largely irrelevant. Weight is all that counts.

One large company collects clippings, including those detrimental to the firm, its products and its management. They are carefully mounted on heavy paper, inserted into expensive binders and accompanied by a "look how much we did for you" letter.

Fortunately, management doesn't pay close enough attention. If the report seems like an acceptable number of troy ounces, the job is well done.

A public relations report can be light in weight and heavy in effectiveness if each press penetration supports and reinforces the position.

THE WELL–KNOWN–NAME TRAP

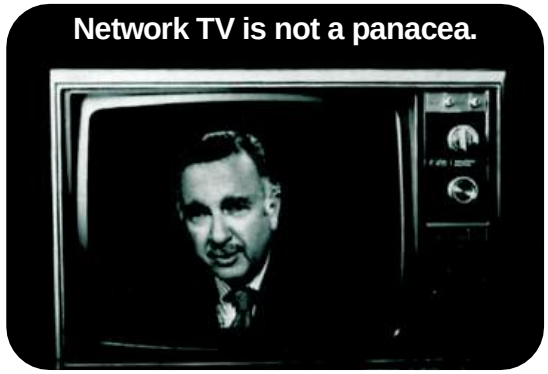
In the past when there were fewer companies and still fewer products, a well-known name was a much greater asset than it is today. Because of the noise level, a "well-known" company has tremendous difficulty trying to establish a position in a different field than the one in which it built its reputation.

Both General Electric and RCA thought they could take their strong positions against IBM in computers. But just because a company is well-known in one field doesn't mean it can transfer that recognition to another.

Also, too much publicity on an individual product can be dangerous. Some products (and companies) have acquired an aura of invincibility that PR, if not carefully handled, can destroy. A god cannot be looked at too closely.

Furthermore, every exposure increases the chances of a nuclear accident. The kind of negative publicity that can wipe out years of hard work.

THE MASS–IS–BEST TRAP



There is a tendency on the part of the publicist to shoot for the moon. To try to place a story first in the biggest, most massive media. But this overlooks the linear nature of good public relations strategy. A story in *Time* or *Newsweek* is the end of a good PR program, not the beginning.

What works best is starting with your core group and then rolling it out. A story in a newsletter leads to one in a trade publication which improves your chances in a general business magazine. Then you can move on to a consumer publication and ultimately to network television. With a few side trips along the way to radio and newspapers.

If you can win the battle with the core group first, your future success is almost automatically assured.

Take Uniroyal's new tire advertising program featuring CRF (for carbon reinforcing factor). This idea desperately needs a *Rubber Age/Car & Driver/Newsweek* buildup. Only by running it through the rollout process can it be strong enough to survive in the marketplace.

Yet in an effort to produce fast results, many PR people attempt to leap-frog this critical first step. They try to take their case directly to network television.

Even if they get on the air, it doesn't always work. The public is not in a good position to evaluate most products or companies. They tend to take their clues from the knowledgeable "in" people or core group.

Without this constant core group reinforcement, a consumer-oriented program can easily fail.

Take a typical consumer. Ten years of advertising and publicity exposure to a drug product, for example, can be overturned by one negative comment from a member of the medical fraternity. And the same principle applies to a broad range of products from automobiles to cameras to pianos.

Yet many companies continue to launch advertising and publicity programs that cannot survive exposure to an expert. (Many experts take great delight in puncturing the neophyte's balloon. Especially if the expert has been bypassed in the positioning process.)

THE IMAGE TRAP

Public relations practitioners often defend their scatter-shot publicity efforts as protecting the company's image.

Sadly, when a crisis develops, they are unable to respond spontaneously. Their emphasis is on protecting the company rather than solving the problem. As a result, they often fail either to influence or to help.

Traditionally, the oil companies generate an enormous amount of general image publicity. When the energy bombshell landed with long lines of fuming motorists crawling to any available fuel pump, oil companies attempted to calm the situation through public relations.

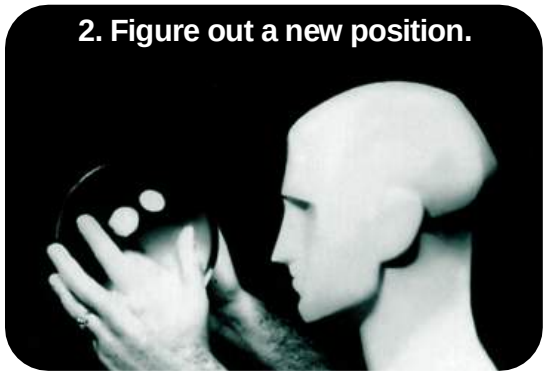
One firm inundated the press with advertising and PR saying, "We told you so and you didn't listen." Another injected massive doses of money into public television. Both were as welcome as an oil slick on a clear lake.

Yesterday when the public was much more trusting, this heavy concentration of public relations might have calmed the troubled waters. Today, it serves no purpose because it lacks a clearly defined position or communications strategy.

Contrast two image-conscious utilities under siege in New York City. When its huge Big Allis generator failed, causing electrical outages and power reductions, Con Edison's response was nearly inaudible. The media noise gap was filled by outraged consumers, public officials and opportunists.

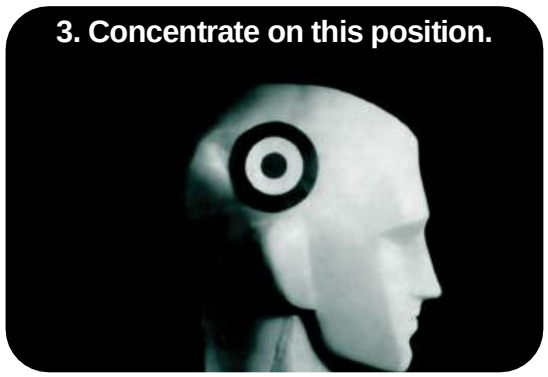
When its downtown switching center was damaged by fire, silencing nearly a quarter of a million phones for several weeks, the New York Telephone Company suspended its image-oriented program.

Quickly, the company implemented a "we're doing everything humanly possible" position, with daily reports in print and electronic media, interviews by normally quiet executives and extensive coverage of every positive step to alleviate the problem.



Even consumers and business people severely hurt by the lack of phone service, publicly lauded the giant utility.

FOUR RULES FOR SUCCESS



If this discussion has motivated you to take a closer look at your public relations program, here are some simple rules that can serve as a starting point.

1. Find out what position you already own in your public's mind. Spend a few dollars for research. Or put on your hat and coat and go out and talk to customers and prospects. And don't forget the most important people of all, the editors of your key publications.

2. Adopt a position that you want to own. Zero in on the specific position you want to achieve through public relations and advertising. Make sure this position is not a general one, like improving your image. And avoid attributes like dynamic, modern, progressive, etc. These are not positions but purely a question of style which public relations can seldom do much about.

3. Convince everyone to concentrate exclusively on this one positioning approach. This includes your management, your advertising agency and, of course, everyone in your public relations department. Stick to your one basic position and reinforce it with every press and public penetration.

4. From time to time, evaluate your PR position along with your advertising, merchandising and overall marketing positions. Public relations is simply one of a number of tools all aiming at the same direction. It is self-defeating when PR pulls in one direction and advertising in another.

Remember, the name of the game in the seventies is not advertising. It's not public relations. It's positioning.

"Positioning in PR" was written by Al Ries and Howard Geltzer, Ries & Geltzer PR. Reprinted with permission of authors.

GLOSSARY OF TERMS

Active: a trademark of a liquid detergent for washing dishes and fabrics first put on the market in 1963 by Witco Chemical Company, Inc.

Advertising Age: a leading American weekly trade magazine covering major advertising news, developments and trends. It also features articles on surveys and award-winning campaigns.

beryllium: a steel gray, light, strong, toxic, metallic substance that resists corrosion. Beryllium can be mixed with other metals (such as copper) to create a hardened alloy.

Big Allis generator: the name of an electric generating unit that served the New York area and which was the world's largest generator when put into service in 1965. However, during the huge blackout of the Northeastern United States and Canada on 9 November 1965, caused by a failure to an electrical relay system in Ontario, Big Allis was badly damaged. From that point onward she was plagued by mechanical problems, some of which resulted in loss of power to parts of the New York City area, resulting in public complaints of poor service by the utility company. Big Allis got her name from her maker, Allis-Chalmers Manufacturing Company.

Car & Driver: a monthly magazine for auto enthusiasts that contains reviews (road tests) of new cars and associated products as well as data on racing and the automotive industry.

Coca: short for Coca-Cola, the largest selling soft drink company in the world. The drink Coca-Cola was first made by an Atlanta pharmacist in 1886 from coca leaves (from a small shrub found in South America) and cola nuts from the cola tree (found in such locations as Africa and South America). Originally created as a cure for various ills and hangovers, it wasn't until the early 1900s that it became popular when another Atlanta pharmacist bought the formula and, through wise marketing, expanded the company throughout the first quarter of the 1900s. The company continued to expand and by the end of the twentieth century it was distributing and selling their soft drink in every country in the world.

Colgate-Palmolive: a large company which originally started out in the candle and soap business and eventually grew to manage five main segments — oral care, personal care, household surface care, fabric care and pet nutrition. The company markets such well-known products as Colgate toothpaste, Irish Spring soap, Mennen deodorant, Palmolive dishwashing liquid and Fab laundry detergent. The name Colgate was the surname of its original founder and Palmolive was the name of the soap the company sold in the early 1900s and which became the best-selling soap in the world.

Con Edison: the Consolidated Edison Company of New York, Inc., a large electrical utility company that supplies both electricity and gas to the New York City area.

4-H Club: one of the largest youth organizations in the United States, it fosters nonformal educational programs as well as participation in organized projects. It originated at the turn of the twentieth century because of a need to improve life in rural areas. It introduced improved methods of farming and homemaking and taught youths to learn by doing, such as growing corn, testing soil, etc. Later the organization expanded into

urban areas. The four Hs stand for head, heart, hands and health and the members pledge: "I pledge my head to clearer thinking, my heart to greater loyalty, my hands to larger service and my health to better living, for my club, my community, my country and my world."

General Electric: one of the largest companies in the world, it manufactures light bulbs, home appliances, equipment for hospitals, factories, power plants and steel mills. The company began in 1892 and by the turn of the century was producing everything for the electrification of the United States: generators, electric motors, electric light bulbs and electric locomotives. The company expanded throughout the twentieth century and is responsible for thousands of new products, has over 50,000 patents and employs over 400,000 personnel.

Hertz: a United States automobile rental service that started in 1923, named after John Hertz, an early owner. The company expanded not only in its US based offices, but established branch offices in many parts of the world, becoming an international organization and number one in car rental services. It offers various current model cars on a short-term rental basis — daily, weekly or monthly in downtown and suburban business areas as well as at airports and resort locales.

Honeywell: reference to Honeywell, Inc., a major American corporation which produces a variety of electronic equipment, including computers, thermostats, systems for automated industries, and guidance systems for planes and missiles. Honeywell entered the computer business in the mid-1950s and in 1970 greatly expanded its computer production by buying General Electric's computer operation. It competed against the leading computer company, IBM, by positioning Honeywell as the logical alternative. The company promoted itself as "The Other Computer Company" and IBM as "Mr. Big." In 1991 Honeywell went out of the computer business and used its digital computer technology in its traditional field of activity of automated controls.

IBM: International Business Machines Corporation. IBM is one of the world's largest companies and in the 1970s was a leader in the manufacturing of such items as computers, typewriters, dictating equipment, electronic cash registers and photocopying machines.

Leff Dental Golds: a company that operated in the 1970s and which sold gold for use in both jewelry and dental work.

Lindbergh, Charles A.: (1902–1974) American aviator and engineer best known for making the first solo nonstop flight across the Atlantic Ocean on May 20–21, 1927. Lindbergh made the flight in the plane, *Spirit of St. Louis* in 33½ hours despite having no radio and having direct vision only through a side window of the plane. The flight gained Lindbergh international fame and he was honored with awards, celebrations and parades.

Nader, Ralph: (1934–) American lawyer who became famous as an advocate for consumer protection against government and business practices considered dangerous to public health and safety. His book, *Unsafe at Any Speed* (1965), attacked the American automobile industry for placing profits and style over safety. It specifically criticized General Motors Corporation (one of the largest automobile manufacturers in the world) for building a vehicle he called a "death trap." The book became a bestseller and led to the passage of legislation which gave the government the power to enact safety standards for all automobiles sold in the United States. General Motors tried to discredit Nader personally and set private detectives on him. Nader sued General Motors for

invasion of privacy, and the company was eventually forced to pay him $300,000. Nader also publicized the possible dangers of excessive use of X-rays, food additives and radiation from TVs. Additionally, his efforts brought about stricter safety and health laws in meat and poultry industries, coal mines, etc.

Newsweek: a weekly newsmagazine in the United States started by a former employee of *Time* magazine. The format consists of short articles giving opinions on various subjects such as international affairs, sports, books, movies, science, etc.

Other Computer Company, The : Honeywell, a company which manufactured computers. They used the line "The other computer company versus Mr. Big" in their advertisements, referring to themselves as "The Other Computer Company" and IBM as "Mr. Big." This was a very successful positioning strategy for Honeywell. *See also* **Honeywell.**

RCA: Radio Corporation of America, a large, diversified corporation dealing mainly in electronics and communications. RCA is mainly known to the public for its home entertainment equipment such as radios, stereo equipment, television sets and video equipment. In the 1960s it entered the computer industry but in 1971 withdrew from it after financial losses totaling nearly 250 million dollars.

rollout: the broad, and normally step by step, public introduction of a new product or service through announcements, exhibitions and advertising.

Rubber Age: a rubber industry and trade periodical first published in 1917. It is currently published every other month.

Sony: one of the largest and most successful electronics manufacturing companies in the world. Started by two Japanese men in 1946, the company has a history of innovations such as the first transistor radio, the Walkman portable cassette recorder and the compact disc (in cooperation with another company). In the 1990s, Sony acquired the Columbia Broadcasting System and became one of the world's largest entertainment companies — including music production and film. The name Sony was adopted in 1958 and comes from the word *sonus* (Latin for "sound") and *sonny* (which means "little son").

Sports Illustrated: a weekly sports magazine launched in 1954 by American editor and publisher Henry Luce. Its circulation grew rapidly from the start, reaching 575,000 in its first year; 1,000,000 by 1962 and more than 3,000,000 by the 1990s. Written in a non-newspaper style, the magazine features sports information and entertainment articles using both text and pictures. For a period of time the magazine positioned itself as the "Third Newsweekly" behind two major newsmagazines, *Time* and *Newsweek*.

Third Newsweekly : an advertising campaign done for *Sports Illustrated* magazine which positioned it with *Time* and *Newsweek* magazines, the two leading weekly newsmagazines.

Time: a weekly newsmagazine in the United States, whose format consists of dozens of short articles giving opinions on various subjects, arranged under departments such as international affairs, business, education, science, medicine, law, religion, sports, books, movies, etc.

U-Matic Videocassette System: a type of videocassette format newly created by Sony Corporation in the late 1960s. Consisting of a hard plastic, self-contained cassette, it holds a ¾ inch high tape for recording or playing back video. Although too bulky and expensive for home use, they became popular for educational and industrial use, such as in broadcast and video production and dominated the market in the early 1970s.

Uncola: a term coined to market a popular American soft drink, Seven-Up (7-UP). Competing against one of America's leading soft drinks, Coca-Cola, and other cola companies, Seven-Up gained a stable place in the soft drink market as the "Uncola." This term was used in many different advertisements and emphasized the brand's characteristics that were opposite to those of cola drinks.

Uniroyal: originally named the U.S. Rubber Company, it produced bicycle tires but switched to car tires in the beginning of the twentieth century with the advent of the automobile. In 1966, U.S. Rubber changed its name to Uniroyal. In later years the company merged with its principal competitor, Goodrich, forming the Uniroyal-Goodrich Tire Company but was sold in 1990 to another large tire manufacturer, Michelin.

vertical magazines: business publications with specific concentration on the needs, interests and activities of one particular industry, profession or trade. For instance, a magazine for dentists would be one which only interested those associated with the dental industry. In contrast, horizontal magazines would have editorial content of interest to many different professionals.

Wall Street Journal: the leading US financial and business daily newspaper, published in New York City. It was founded in 1889 by Charles H. Dow (1851–1902) to primarily cover business and financial news. It has one of the largest circulations of any national newspaper in the US and is known worldwide. "Wall Street" comes from a well-known street of the same name in New York City, so called from a wall extending along it when the city earlier belonged to the Dutch. It is the major financial center of the US where some of the most important American financial institutions are situated.

Witco Chemical: one of the world's largest manufacturers of specialty chemicals. Witco began as a distribution company with its largest market in carbon black and various other coloring agents needed by Chicago's printing industry. Later it began manufacturing its own products but throughout the '50s, '60s and '70s Witco bought many diverse acquisitions including a detergent business. By the 1990s the company again concentrated on chemical specialties.

POSITIONING, PHILOSOPHIC THEORY

SCIENCE OF SURVIVAL AND *8-8008*

The bible of PR is the book *Science of Survival,* including the Chart of Human Evaluation, followed by *Scientology 8-8008,* for the graduate PR expert.

EFFECTIVE PUBLIC RELATIONS

[*Effective Public Relations,* by Scott M. Cutlip and Allen H. Center, published by Prentice Hall, Inc., Englewood Cliffs, New Jersey*]

The book, *Effective Public Relations,* is quite good. The basic technology of PR is contained in this book, plus the policy letters on PR and marketing.

The HCO PLs PR Series should be read *before* reading *Effective Public Relations* as the authors don't tell you what the subject is for.

The main faults of *Effective Public Relations* are very few: (a) It denigrates press agentry to some degree, even though a tremendous amount of existing media is pure press agentry in its oldest hoopla form; (b) It continuously advises frankness with the press to a point where a PR, using that, could easily create situations of out-PR. It is not that a PR should ever lie to the press, but neither is it necessary that he tell them all he knows. Otherwise, except for these two points the book is a near masterpiece.

"POSITIONING IN PR"

There is also a little booklet, "Positioning in PR" by Al Ries and Howard Geltzer, first published by Ries & Geltzer PR in the 1970s, which is on the subject of positioning and is quite good. (Ref: HCO PL 12 Sept. 88R, PR Series 32, POSITIONING IN PR)

*[*Editor's Note:* A special annotated edition of the book, *Effective Public Relations,* with margin notes by LRH printed in red ink, is available from Bridge Publications (US) and New Era Publications (non-US).]

[*Big League Sales Closing Techniques*, by Les Dane, published by Parker Publishing Company, Inc., West Nyack, NY is available from Bridge Publications and New Era Publications.]

PR contact people should be trained up on *Big League Sales Closing Techniques* AND USE THE TECHNIQUES TO SELL NOT COURSES BUT AGREEMENT THAT SCIENTOLOGY IS NEEDED. Use Big League to get agreement. The thing sold is the idea of Scientology. The exchange is acceptability (not money).

DEFENSE

(Written 24 Feb. 80.)

(Cancels and replaces HCO PL 22 Sept. 88,
PR Series 41, CREATING OVERWHELMING POPULARITY.)

The best defense on any front would be an enormous increase in popularity and delivery volume of Scientology. Public opinion could be built up formidably.

Whatever other defense is in progress, the above could be and will be, if done, the key factor: overwhelming public popularity.

BOOKS AND MARKETING

Don't plan books to be printed without Marketing liaison and don't mishmash and cross publics when marketing books. Don't market with generalities; marketing is aimed at specific publics. And above all, don't downgrade or put black PR in books. Also, don't hit at allies to upset them. This is a theta line. Make it theta all the way. If any black PR is done on it, it is only to blow enemies off it. But the theta in these works, all by itself, will blow the enemy away.

HCO PL	5 Feb. 69 II	PRO ACTIONS
HCO PL	12 Sept. 82	PR Series 38 PR FUNCTIONS

The flavor and flair of showmanship and pizzazz can be lacking in PR and marketing.

Showbiz, the book biz, the record biz is full of spangles and glitter and the trumpet call. Hyperbole is the order of the day.

Today's advertising world is overloaded with many messages (just turn on the TV) and it takes abnormally brilliant marketing and glitter to get a message through and impinge on the public.

Showmanship in presentation and marketing imbues things with life — it makes them stand out and be noticed.

In PR and marketing today one cannot hide the wares and still succeed.

HCOB/PL	7 Aug. 79	Esto Series 36 Product Debug Series 8 FALSE DATA STRIPPING

There is a datum as follows — when admin won't go in, tech is out. When tech won't go in, ethics is out.

Here is how this fits in the PR world:

WHEN PR WON'T GO IN, ETHICS IS OUT.

There are several ramifications of this, which is to say, several possible flows. It could be the PR himself is not pushing and is out-ethics.

It could be — the usual reason — that the via to the target public or even the target public is out-ethics in some way.

It could occur that the target (or via to it) is being pressured by an out-ethics third flow — as in third party tech.

But, whatever the flow, the fact remains that the above datum is true.

Any PR pushing a worthwhile message and pushing it with good ideas and PR tech will get his only loses by reason of the above datum.

An example is PRing an org which then does not respond — an instance which just happened, out-ethics was rife at the org top.

This is not to put PRs in the ethics game. And it is not to serve as an excuse for failure.

The datum is for use — to widen up the obs ability of the PR for it opens a new avenue to him for a PR handling!

Out-ethics on the surface appears as withhold phenomena. This makes the person the PR is working on or via behave as they do per withhold HCOBs which a PR should know.

PR, as well as being bright, is often a wily, clever game. If one knows what he is up against he can develop a PR handling to fit.

If one suddenly realizes he is talking to no avail he need not just go on butting his head against the wall or countering chop or insults. There are ways to blow withholds into view and withholders out of the water that are too numerous to mention. If one, seeing the key datum of this PL is the case, then shifts his approach to blowing the withhold to bits, he wins. *And* he stands a big chance of now getting his message through where before it was all failure.

As an example, the crudest form would be an abrupt shift and question, "Who has been lying to you about (principal)?" This enters it into false data stripping instantly. There are many, many ploys depending on the flow and situation encountered.

"Worse than" is a tool a PR can use. One infers the withhold is far worse than it possibly could be. "Why are you planning to (shoot, destroy, wreck) (principal)?"

The above datum has a thousand uses.

Don't get bugged by failures to get a message through. Having given your best efforts resulting in a block, don't quit. Apply the above datum. It serves the same purpose as dynamite. It can clear the way for flows to go through even if the pieces fly sky-high!

PR SERIES 38

PR FUNCTIONS

The functions of a PR are all those listed in "Effective PR" (the book, *Effective Public Relations* by Cutlip and Center, published by Prentice-Hall, Inc.), and policies relating to PR actions.

But remember this:

PRs evolved from press agents and a basic area of their hat — particularly as it applies to promotion — is PRESS AGENTRY.

A PR must have some skill in:

A. News stories

B. News photography

Without these skills he cannot really comm to the media.

In obtaining "profitable images" a PR must take advantage of, stage or conceive of an event that gets attention. He must be able to assume the viewpoint of a reporter, an editor or any of the types of public he is seeking to reach. Otherwise he will not perceive what they will accept. This done, they will find his comm convincing and he can get his purpose done.

A PR must be able to write "handouts" ranging from all the facts he wants received to a complete news release that will be printed verbatim.

A PR must be able to get taken or take news type photographs for use in media.

And a PR must be able to line up media — or audiences — to get his message across.

The basic tools of a PR are all embraced in the word "messages." These can be oral, written or pictorial.

They must be oriented to the purpose the PR is seeking to achieve.

They must be arresting enough to impinge. They must be bright enough to interest.

These are the basic tools of the PR: purposes, messages. From these come profitable images.

The purposes are many, the message forms and channels are many. To achieve his product of images, the PR must acquire knowledge of and skills in them all.

PR SERIES 39
PR AND PURPOSE

(Taken from an LRH management briefing of 12 Sept. 82.)

Refs:

HCO PL	1 July 82	AKH Series 41 MANAGEMENT COORDINATION
HCO PL	19 July 82	PR Series 37 FAILED PR
HCO PL	6 Dec. 70	Personnel Series 13 Org Series 18 THIRD DYNAMIC DE–ABERRATION
HCO PL	14 Jan. 69 I	Target Series 1 OT ORGS
HCO PL	31 Jan. 83	THE REASON FOR ORGS

It is of considerable interest that the primary failure of management has been isolated.

This discovery has a lot to do with PR work and is important to them.

The Admin Scale is the basic policy here.

Numerous programs written by management reveal a singular fact: The *purpose* of the program would not have been achieved by the targets written *and* the purpose written in, in some way was off the wall.

Also management at this time cannot seem to grasp "coordination." (Ref: HCO PL 1 July 82, AKH Series 41, MANAGEMENT COORDINATION)

Common denominator of all these things is at the top of the Admin Scale: It is *purpose.*

Programs are written to achieve a *purpose.*

To coordinate, one must have a purpose to coordinate *to.*

A primary function of a PR is to make known, enhance and forward the purposes of management.

Now let us consider the plight of a PR who is not serving someone who has a real purpose. The PR would be adrift or into forwarding an emptiness.

But let us consider a PR trying to work with or put an image into a group in the absence of purpose.

That, as you can easily see, would be grim.

A PR, to get cooperation, would have to be forwarding some agreed-upon purpose.

Suppose that a PR, representing his client, was trying to work with a group of execs who had no purpose or (as in out-ethics scenes) had an entirely different purpose. It would be worse than grim — the PR would have to fight every inch of the way! There would be no money, no personnel, no volunteers, wow!

So one comes down to an overriding rule for PRs:

THE FIRST STEP IN ANY PR CAMPAIGN IS TO DING IN THE *PURPOSE* OF THE CAMPAIGN.

The words "ding in" are used advisedly. We do not care if the targets from whom we are requesting cooperation have any purpose at all.

There are various mechanisms that can be used. When one announces a *very* good and worthwhile purpose, the targets can feel ashamed or guilty for not having it and *can be made to agree and cooperate* out of a fear they will be exposed as antisocial or a pariah.

So the PR does not really care whether they *really* believe in that purpose. If it is a very good and needed one, even off-purpose and out-ethics cats have to give at least surface or public agreement to it. Thus we use the words "ding in."

If one studies this and works out his own examples, one can see that successful campaigns all begin with a stellar, well-stated *purpose.* Then one uses this, repeating it often, to get done the targets that will accomplish it.

It is a deadly tool — even the most balky or privately other-intentioned people have to cooperate: "But you agree that (purpose), so therefore ———."

So a PR can work and accomplish a well-defined and vital purpose even when the group that should be cooperating (a) has no purpose at all or (b) has other purposes.

It also follows that a PR can *instill* purpose in a group, using all manner of PR tech. Thus a PR should be an expert in shaping and defining and communicating *purposes.*

A survey finds what buttons a group has — what they will accept. One can also survey trial purposes to find out what communicates.

But one is *not* limited by what a group accepts. Most groups are far below purposes — probably even below orders on the Admin Scale.

A PR skilled in the developing and handling of purposes can get almost anything moving. It can be the "long enough lever to move the world." All PR campaigns that fail did so because they omitted this step. All those that really succeeded had great purposes behind them, well-stated and dinged in.

One works it out, then *tells* the people what purpose *they* have. The PR operates at cause.

With practice, skill and communication, the PR, knowing this, can start or end wars; drive whole populations into serenity or mass hysteria. It is no light tool.

PRs should know this cold.

In many instances over the years this has been THE Why of management troubles — they had not grasped purpose. And *there* a PR can really shine!

NAMES AND THE LOCAL ENVIRONMENT

Refs:

HCO PL	15 Sept. 88	Marketing Series 26 NAMING SERVICES AND PRODUCTS
HCO PL	13 Aug. 70 III	PR Series 3 WRONG PUBLICS
HCOB	26 Feb. 84 II	Art Series 15 ART AND INTEGRATION

There is a principle in naming (or writing songs, etc.) which is to get general empathy by tying in a whole public to its environment. They have the environment in common *and* are often fond of it. A being's home area, no matter how drab, is always a matter of sentiment to him and he identifies himself with it.

Thus, if the purpose is to make something being named acceptable to locals, the press or even VIPs, the proper PR angle is to tie it into their environment in a way they will accept it — not consider it odd or intruded upon them as something strange in violation of their "home" ideas.

One would get better press and local mileage if what is being named were tied to their home. They would then "own it" and point it out as desirable and even defend and protect you.

The locals will point it out proudly. The press will treat it well. The VIPs will accept it.

HCO PL	24 Aug. 65 II	CLEANLINESS OF QUARTERS AND STAFF, IMPROVE OUR IMAGE
HCO PL	11 Dec. 69R I Rev. 16.9.88	APPEARANCES IN PUBLIC DIVS

The amount of public demand for service and your future income are both largely dependent upon GOODWILL.

Goodwill is the reputation an organization has with its publics for integrity, good service, prompt bills paying, high quality delivery, friendliness, etc.

Excellent technical delivery is what generates a blaze of goodwill and PR that spreads by word of mouth like wildfire.

Events, open houses, tours, film or slide presentations — all such activities serve to generate public interest and goodwill.

Training and processing are commodities that are far, far more desirable than anything else this world has to offer. And when they are delivered with superlative technical application with the out-of-this-world gains that are possible, you would drum up so much public support that you would soon have an army of ardent supporters outside your door, no matter how much the psychs and press railed about us.

PR

Good technical delivery makes it possible to have good "PR" (public relations). By definition, PR is good works well publicized. When technical is creating miracles on a regular basis, it is simply a matter of making this broadly known. Your public will even do it for you on a "word-of-mouth" basis.

WORD OF MOUTH

Almost all Scientology prospects come from people who have had service who are urging other people to have service or read books on the subject. That is called WORD OF MOUTH. Word of mouth comes from having numerous people in the field who are happy and cheerful and satisfied with their service and who are active in the fields of Dianetics and Scientology. There is where the bulk of your income comes from.

Word of mouth is a superior form of advertising to newspaper, radio and TV ads. People tend to believe their friends. They are skeptical of advertising. "It worked for Joe, it will probably work for me" is what people think. And in Scientology they are correct.

When word of mouth and PR have been in neglect, it will be because the org has not worked on the basis of goodwill and has let its tech go out (and is therefore costing itself a mint). This applies to all organizations and missions all the way up to the FSO and includes other units and networks as well.

The "word," whether good or bad, spreads like wildfire. That's why you'll never see anything empty out quite as fast as an Academy that is run nonstandardly; or conversely, anything fill up as quickly as a tightly scheduled, smartly run, in-tech Academy.

SUMMARY

Other factors also enter in where goodwill, word of mouth and PR are concerned. The public, in dealing with the business world, has grown to expect clean, pleasant quarters and smart, friendly service.

There is nothing as destructive of goodwill as dirty quarters, sloppy, "help yourself" service and an unfriendly staff.

Clean quarters, professional conduct, good service and above all, a friendly staff, all go a long way to promoting goodwill.

It is not only the job of the Public Relations Officer to secure goodwill. It is part of *every* staff member's job to help build goodwill for the organization by doing those things that will cause the public to think well of it, and by refraining from doing those things that would result in bad PR for the organization.

Above all, it is every staff member's primary concern that the organization is delivering the best tech quality possible. This point *in* is *the* source of goodwill.

You must take a hand in creating goodwill. It is *your* org!

HARD EVENTS AND PUBLICITY

(From LRH PR Training Instructions. Cancels and replaces HCO PL 21 Sept. 88, PRESS AGENTRY.)

Refs:

HCO PL	12 Sept. 82	PR Series 38 PR FUNCTIONS
HCO PL	5 Feb. 69 II	PRO ACTIONS
HCO PL	28 Oct. 68 I	PRESS RELEASES
HCO PL	14 Aug. 63	PRESS POLICIES

There is a whole wide sector of PR activities which come under the head of "marketing" which concerns the handling of events. Mid-West Rogers is the company which handles all the centennials in the United States, or used to. I was trained by Mid-West Rogers. They handle whole events like setting up a whole county fair or a whole centennial or such. We are not engaged in that but some of the tech bleeds off into "hard events."

The definition of a "hard event" is simply a newsworthy action.

A trained PR knows very well that the issuance of a statement is liable to get little media. A statement has to be coupled with a "hard event" for the media to pay attention to it. This is true of newspapers as well as television.

Newspapers don't quote statements made by somebody in the absence of hard news. You have to tie them into hard news. Any kind of an event can be called hard news.

In creating hard news events, the media can sometimes push them sideways as "publicity stunts." But oddly enough, they have no objection to them as long as they just seem to be publicity stunts. It is only when something is violently faked that newspapers and the media take exception to it, such as the kidnapping of Aimee

Semple McPherson* of ages back. This was basically a publicity stunt and it sure backfired. It finished Aimee's church.

So if you keep your publicity stunts in the open as publicity stunts you can escape this trap.

Any little action no matter how minor or major can be stated to be a "hard event." "Hard" simply means actual and "event" simply means that it occurred. To this one can unite a statement, express sentiments or curve or make public opinion or give viewpoints. But to the media these two things are not separable.

***Aimee Semple McPherson:** (1890–1944) evangelist who, from the age of seventeen, devoted her life to preaching and healing. She founded an international religious movement and in 1923, with donations from her followers, opened Angelus Temple, a 5,300-seat auditorium in Los Angeles. For the next twenty years she delivered sermons that were broadcast simultaneously over the radio station she purchased. Sunday services at the temple were attended by thousands of worshipers who sometimes witnessed a fifty-piece orchestra, prayers, singing and a dramatic sermon sometimes accompanied by costumes appropriate to the theme (she once wore a policeman's outfit when preaching about "God's Law"). She subsequently founded a Bible college, an evangelistic association and an international church. Aimee was repeatedly in the headlines, most notably in 1926 when she disappeared for five weeks while swimming in the Pacific Ocean, was thought to have drowned, but reappeared saying she had been kidnapped for ransom. She was tried for perjury but the case was dismissed. In 1944, she died from an overdose of sleeping pills.

Book: *Effective Public Relations* by Cutlip and Center

A news release must be written as a news release. It requires the fundamentals of what a press story is. It must signalize an event. Otherwise, it isn't a newspaper story an editor would pick up and print.

Look in newspapers and see what they release as press stories. Editors never print releases which are not hard news or just an expression of an opinion. Some newsworthy fact has to start the article and the remainder of the article simply expands that fact. The fact must be newsworthy and timely.

Book: *Effective Public Relations* by Cutlip and Center

If reporters of friendly papers contact a PR, he must have and get across HIS news story.

If you wait for them to dig one up, it is much less likely to be good.

One has to be at CAUSE in PRO. The short comm formula is CAUSE—DISTANCE—EFFECT. If you're not cause you will be effect. That's the way the formula goes.

Picking up an empty life raft on the high seas is not a "maritime report." It is a *news* story. One adds, "We cruised the area and checked the waters very thoroughly and found no survivors," and it becomes news.

News never *happens*.

It is manufactured. One has to be clever. That's the way newspapers work because they sell on INTEREST TO READERS.

This is not in *Effective Public Relations*. It is, however, standard PR actions.

HCO PL	5 Feb. 69 II	PRO ACTIONS
HCO PL	28 Oct. 68 I	PRESS RELEASES
HCO PL	14 Aug. 63	PRESS POLICIES

Part of the art of PR is follow-up. You can usually get *three* stories out of one publication.

As *repeated* name is the key to getting a name known, it is vital to get follow-ups on every release actually printed.

1. The original has to be clear enough to get printed.

2. One then has to get cleverer and get a follow-up, same story.

3. By being very clever indeed one can get a third story with a follow-up of a second.

It is not true that only three stories can be gotten for all. You can, of course, get dozens. But three is par and to get less is not professional.

This should be part of any course or briefing to PRs.

DIANETICS AND SCIENTOLOGY ARE NEW

People who have been in Dianetics and Scientology for years see it as a way of life. They accept it.

But to listen to them you'd think Dianetics and Scientology had been around for the last 50 billion years at least!

They have lost their viewpoint of the newness of Dianetics and Scientology.

They do not realize that Dianetics and Scientology are new news to the bulk of the world's population.

They do not realize that the oldest Dianetics or Scientology books are *brand-new* books to the bulk of humanity!

Before 1949 man's knowledge of himself, the spirit and the mind was a black barbarism. Look over the psychology, psychiatric and religious texts of the 30s and 40s. Man could not change. He was a degraded animal. The way you applied therapy was dreams or drugs, ice picks and ice baths.

Only Dianetics and Scientology began the road out of that witch pit.

But the witch pit is still there for almost all the world!

Because Scientologists number millions, Scientologists do not look at the *billions* to whom Dianetics and Scientology are BRAND-NEW!

Those billions are still in the witch pit. They are still boiling.

Dianetics and Scientology are NEW NEWS.

We are the only road out.

Just because YOU are making it is no reason the world will. (If you *aren't* making it in auditing, if you are a "failed case," get yourself a repair — Scientology is the only approach ever developed that repairs itself too! And that is also new news!)

Let them in on the new news!

Cultures change slowly. It took centuries for man to realize that slavery was wrong and could be changed. Cultures don't shift overnight.

So write and act like you have *new* news.

Recover your viewpoint by comparing what you now know to what they still don't know in even "modern" institutions.

You have new news. And Dianetics and Scientology are good news. In fact, the best news man has ever had. Don't sit on it!

MARKETING SERIES 2

MARKETING, PROMOTION AND DISSEMINATION DEFINED

MARKETING: The conceiving and packaging and the moving of a specific product into public hands. It means to prepare and take to and place on the market in such a way as to obtain maximum potential and recompense.

PROMOTION: To make something well known and well thought of. In our activities it means to send something out that will cause people to respond either in person or by their written order or reply to the end of applying Dianetics or Scientology service to or through the person or selling Dianetics or Scientology commodities, all to the benefit of the person and the solvency of the org.

Promotion is the art of offering what will be responded to. It consists only of what to offer and how to offer it that will be responded to.

By promotion in a Scientology organization we mean *reach the public* and *create want.*

DISSEMINATION: Spreading or scattering broadly. By dissemination in a Scientology organization we mean making broadly known the materials, services and results of Dianetics and Scientology through books, promotional material, letters, films or other media or activities, including word of mouth.

HCO PL	21 Jan. 65R	VITAL DATA ON PROMOTION
	Rev. 5.4.65	THE FUNDAMENTALS OF PROMOTION
HCO PL	17 Nov. 65	THE BASIC PRINCIPLES OF PROMOTION

The Marketing Bureau motto is CREATE WANT!

The PURPOSE of marketing is to CREATE WANT and to SELL SOMETHING.

That includes selling something that can be delivered.

The keynotes of *any* marketing action are:

1. Search around and find what there is to sell. Get very full lists.
2. Pick one item.
3. Find out *all* about it.
4. Find any past history of it or any similar item in sales.
5. Survey the item on a variety of publics to find out:
   a. Which public will buy it,
   b. What that public wants, needs or would demand,
   c. Any past surveys on it or a similar item,
   d. Do a positioning survey per HCO PL 30 Jan. 79, PR Series 28, Marketing Series 5, POSITIONING, PHILOSOPHIC THEORY.
6. A. Use the survey results to position (particularly 5d).
   B. Use the remaining survey results to write the copy, keeping in mind that your positioning dominates it.
7. Write a sales campaign including what want it fulfills (by survey) and what the key buttons are for that public chosen (by survey). Include fliers, info sheets, ads, material for salesmen of it, order forms. Use graphic design which forwards the positioning and use the positioning in the surveys in all issues

regarding the campaign. "The Basics of Marketing Stable Data" has to be applied heavily at this point to all issues, ads and campaigns. (See HCO PL 7 Feb. 79R, Marketing Series 7, THE BASICS OF MARKETING.)

8. Design or get designed and laid out the items in the sales campaign.

9. Get them printed (or placed when ads) according to the design.

10. Write a full program for the item's release whether new or old.

11. Assure a supply of the item can be gotten for selling at the points it will be sold.

12. Release the campaign.

13. Adjust and handle any bugs in any points above.

14. Arrange a continuation of the campaign so that it is not just a "one-shot" action but will go on and on, such as distribution and continued issue of the literature.

15. Keep a visible record of the successes of the campaign week to week and be prepared to correct, renew or restart the campaign whenever it falters.

16. While working on the above, during the wait periods, pick another item and go through all steps for it as above.

17. Keep each item's checklist (as per this PL) in a folder for that item which contains all marketing actions. All pertinent papers, work and work copies to be filed in this folder with all results as they continue to come in.

18. Review folders from time to time to evaluate them and restart them or reinforce them.

19. Do not leave any stone unturned to find old or new items that could be marketed.

20. Do not fall for needing new items only or pushing only the new and realize that volume selling of everything you have is the way to market successfully and that you have to keep on selling anything in order to get a large constant gross.

21. Be a high-volume success!

HCO PL	5 Dec. 71R Rev. 10.9.88	PR Series 12 Marketing Series 20 HOW TO DO SURVEYS
HCOB	25 Sept. 71RB Rev. 1.4.78	TONE SCALE IN FULL
HCOB	26 Oct. 70 II	OBNOSIS AND THE TONE SCALE
HCO PL	15 Dec. 2000	PR Series 13 GOODWILL PROMOTION

We can do too much.

By just flying ruds on people we could cure what often passes as insanity.

By Word Clearing we could change the whole educational picture.

We could handle the whole problem of psychosomatic (mentally caused) physical illness.

We could lower industrial absenteeism from illness.

We are the only people who can cure drugs.

We could do a thousand other things with our tech.

That makes us unbelievable. Nobody on the whole track could ever do these things.

So when we broadly offer *everything* we can do, it is too much.

SURVEYS

To find out what people want or will accept or will believe, one does SURVEYS.

HCO PL 5 Dec. 71R, PR Series 12, Marketing Series 20, HOW TO DO SURVEYS, tells you how to do a survey.

HCO PL 2 June 71R, PR Series 10, BREAKTHROUGH, PR AND PRODUCTION, TONE SCALE SURVEYS, tells you how to phrase survey questions.

It is not hard to do surveys.

When you have one done, the data should be USED. The real fault in doing surveys is not using the result in promotion.

EXCHANGE

You and your org are involved in exchanging valuables for valuables.

You offer a valuable service in return for valuable money.

(See HCO PL 27 Nov. 71 I, Executive Series 3, Finance Series 6-1, MONEY and HCO PL 3 Dec. 71, Executive Series 4, Finance Series 6-2, EXCHANGE, for further information on what exchange is.)

So in surveying, you are in actual fact seeking to know WHAT SERVICE THAT YOU CAN DO WILL PEOPLE CONSIDER VALUABLE ENOUGH TO GIVE MONEY OR VALUABLES FOR.

STATS

When you have this answer, you have the answer to prosperity stats.

PROMOTION

Promo done without survey, magazine ads without survey, fliers without survey, you are going it blind.

It's pathetic to realize that you might be within an eighth of an inch of the right offering without making it. Sort of like digging two feet away from the gold vein and getting an empty hole when you could have a million dollar mine.

Working without surveys, you could spend thousands a month on promotion and lose it all.

Or working WITH surveys, you could spend hundreds on promotion and make hundreds of thousands.

It all depends on knowing how to do surveys, doing them, really tabulating the results and USING what you find.

INVOICES

You can even do a survey out of invoices. You can see what book sells best lately and then look into the book to see what it seems to promise and then promote that you do that and you'd increase your delivery volume.

Or you could find the popular book by invoices, find who'd bought it and survey the buyers as to what they would consider valuable in it and promote that *service,* and you'd increase delivery sales.

You could review invoices to tabulate what part of the town or state your customers came from and saturate (fill up) the area with promo and increase your delivery sales.

You could see by invoice survey what they bought and do a flier on that and use that flier to saturate that area.

Invoices are very useful. It is a must to set up an invoice-counting project to see what to put in the next bulk mailing.

SUCCESS STORIES

Taking all back success stories, particularly from an affluent period, and finding out what the people were most appreciative about and then converting that to a training or processing offer and using it for promo is a vital action. Not to quote the success stories — we do that and it's fine. But to SURVEY the success stories to find out what to offer.

EXAMINER REPORTS

A survey of past Examiner Reports for exam comments after certain specific actions or courses have been completed is very revealing.

This gives you what you can offer with confidence.

It gives you a promotion base on which to build a campaign.

PAST PROMOTION

One also surveys past promotion. What gave the largest percent of response?

Promo which returned 11 percent or 16 percent is phenomenal.

You judge the accuracy of your survey by the success of the promo based upon it. If the success is not great you resurvey.

SATURATION

When you are serving only the same people all the time, you can hit a saturation point (all filled up) by never offering their next action.

This next action requires a survey.

And new people must be fed in.

An example is an AO that got fat selling OT VII to old customers and neglected promotion to get new customers and eventually saw its stats begin to sink.

So surveys of old customers and new customers have to be done and each promoted to.

Thus, you have different PUBLICS which have to be surveyed. In this case "old public" and "new public." Each requires a different survey and a different survey action and different promotion.

TOTAL EFFECT

Desperation often leads one to try for a TOTAL EFFECT. (See Effect Scales in HCOB 18 Sept. 67, corrected 4 Apr. 74, SCALES, and in the book *Scientology 0-8*.)

One has sometimes seen a student trying to push home a full HDA Course in fifteen minutes to his non-Scientology friends.

His R is wrong. He sometimes doesn't even get an ack in exchange!

If, perhaps, he demonstrated a Touch Assist expertly, explaining body comm, they would look on him as a wizard!

Some student can make his whole audience depart by talking about past lives and OT states when if he explained that people often led sad lives after a family member died he might have an awed audience.

But to be sure how to have an awed audience, even the student would have to "survey" a little bit. He'd have to ask them what they wanted handled or something and then talk about that. In that way he would be certain of attention.

A student or an org can get desperate and try for a total effect by telling or offering everything they know — and fly right out of the reality of their audience.

MISSION

You as a Scientologist have a certain mission toward the world.

It is not a very civilized world.

You can bring it friendliness, peace and understanding.

How do you find an entrance point into this unfriendliness and lack of love?

The answer is surveys.

Hereinafter, issue authority must be given only when Promotion can cite what survey it has based this upon.

Survey, lack of, is the weak link in all promotion.

To better your stats you must get this in.

Failure to survey can cost you thousands in ineffective promo and tens of thousands in lost stats.

So the word is:

SURVEY!

KNOW BEFORE YOU PROMOTE!

POSITIONING, PHILOSOPHIC THEORY

Although Madison Avenue has used "POSITIONING" for some years, it has not fully understood the actual philosophical background that makes "POSITIONING" work.

There is an excellent booklet called: "The Positioning Era" put out by Ries Cappiello Colwell, Inc., 1212 Avenue of the Americas, New York, NY 10036, which has been reprinted and issued as HCO PL 13 Sept. 88R, Marketing Series 24, THE POSITIONING ERA. It is an excellent booklet. It does not, however, give the philosophical background which, probably, is not generally known. Probably it was never discovered. I had to work it out myself.

Buckminster Fuller, an engineer and architect of some renown, says that it is a two-terminal universe. In other words, the universe is built by twos.

In electricity you have heard of two "poles" — the positive and the negative. You only get movement or generated energy in the presence of two poles. That is the principle of the electric motor, why current flows from one point to another point and so forth. There are four possible arrangements of these two poles: they are positive-negative, positive-positive, negative-negative and negative-positive.

In the reactive bank a positive and a negative, when occurring together, tend to bring about a stuck point in time. You sometimes see this in a marriage where the husband is jolly and carefree and the wife is sad and morose. One wonders why these people would ever stay together. The fact of the case is, due to reactivity of the mind, they can't do anything else.

Despite propaganda that "one should live for oneself alone," the fact is that it is very difficult and most disappointing to do so. Life really can't be lived on the first dynamic alone. If you don't believe it go on out in space 300 miles and sit there for a while; you won't like it. You'd be calling Houston every few minutes.

In any event, one could say that life was at *least* a two-pole activity. Actually, it is not only always just two but certainly it doesn't go along well with just one and goes best with several — ask any popular person.

Fast communication is most easily done by comparisons. When one asks, "What is the book like?" he really is not trying to get you to describe the book. He means that he wants some comparison. He will be happiest with the answer if he is told that it is like another book with which he is familiar. It would take you a lot longer and involve you in a lot more arguments if you just tried to describe the book to him instead of comparing.

"What does it taste like?" is satisfactorily answered, "Like candy." That, if it has some shadow of truth and accuracy, is a perfectly satisfactory answer to the other person.

So we get a law which is this:

THE UNFAMILIAR IS RAPIDLY INTRODUCED OR COMMUNICATED BY COMPARING IT TO A FAMILIAR.

Joe knows nothing about practice boxing gloves and there are none there to show him and he will be fairly satisfied if he is given a familiar object, pillows, to compare them to.

Thus, one can achieve a very rapid communication by observing the following law:

ONE CAN ACHIEVE THE APPARENCY OF FAMILIARITY, EVEN WHEN THE PERSON HE IS COMMUNICATING TO HAS NO KNOWLEDGE OF THE SUBJECT OF COMMUNICATION, WHEN HE ASSOCIATES IT IN THE MIND OF THE OTHER WITH SOMETHING WITH WHICH THE OTHER IS FAMILIAR.

Positioning takes advantage of a fact that one can compare the thing he is trying to get the other person to understand with desirable or undesirable objects. Desirable objects are now more commonly used in advertising. Undesirable objects are more commonly used in propaganda. By comparing this unfamiliar thing or the thing he wants to sell to another desirable object or by comparing something he wants people to detest to an undesirable thing, he can achieve a rapid communication and comparison.

Further advantage is taken of the fact that one can position *above* a familiar object, *with* a familiar object, *below* a familiar object, *at, to, against* and *away from* a familiar object. This opens the door to an opportunity to establish an opinion of the thing one is seeking to communicate. You might call it an "instant" opinion.

For example, we know that an astronaut is a familiar, highly regarded being. Thus, we position a product above, with, below, at, to, against or away from an astronaut.

We know that people think angels are good, sweet and kind, so we position another something above, with, below, at, to, against or away from angels.

We know people loathe psychiatry, so we communicate something being loathsome by saying it is below (worse than) psychiatry. We could also make people think something was good by saying it was against psychiatry, bad because it would bring them to psychiatry, or awful because it used psychiatrists (like the tax people).

A common use of positioning in advertising is to take a product which, by reason of advertising, is familiar to the public and is regarded by them as the leader in the field and then *positioning* a new untried, unfamiliar product above it, with it, or just below it. Thus the new product gains a sudden spurt in sales by being compared to the leader.

In fact, in the field of advertising this has been the primary use of positioning, probably because no one had carried the idea back to a point of formulating the actual laws of it and thus broadening its use. They thought in advertising, evidently, that the basic theory of it was the "pecking order of hens" which means that the whole barnyard is usually found to have a top hen and a bottom hen and they peck each other in that order.

Apparently, from talking to ad guys, they thought that by putting their products in the pecking order against the top product they made their product higher or just with or just below the top hen. That's what the advertising people get for associating *with* such "experts" as psychologists.

POSITIONING can be seen to have far far broader uses than "cola" and "uncola" ads when you study the above basic PL data. The horizon becomes very very vast and all around because with it you can attain fast communication about the unfamiliar and can formulate "instant opinion."

When used in advertising, posters, write-ups, PR, propaganda or any one of many activities, forceful and effective positioning requires certain requisites:

1. The selection and identification of the public or person one is trying to cause to have an instant opinion, desire or repugnance.

2. Work out whether you are trying to do a good or bad relationship to the familiar object you will find and what kind of an opinion, desire or repugnance.

3. Survey that public with questions which do not even mention the thing you are eventually going to use the survey for to find what they consider wonderful, popular, useful, etc., etc., or awful, terrible, etc., etc. You can survey for attitudes, objects, professions or anything else you have chosen that will even dimly compare with something you are going to use the survey to push.

4. From the majority answer of this survey, choose an object, profession, attitude, etc., etc., that they think is great or awful or whatever.

5. Get a bright idea of how to compare the thing you were trying to communicate to the familiar object, attitude, profession, etc., that they all firmly have an opinion on.

Do as many other surveys as you like of this same public you are trying to reach to get their attitudes in general or attitudes about what you found or even their general

likes and dislikes, vocabulary, habits of dress, etc., so you can write copy and draw pictures that seem to be them or what they would say or do.

Do your drawings and write your copy.

If you have been clever, you will succeed in communicating forcefully and effectively and instantly at a glance something that was very unfamiliar to them previously.

All the other rules of copywriting, art and design, impingement, etc., are dovetailed into this to make more of it.

By doing a lot of practice with this and drill, drill, drill, drill and getting experienced with it, you will suddenly find yourself able to use this in PR, advertising, marketing and communication in general with an impact that will be very effective and very startling.

COME–ON DISSEMINATION

A recent look at dissemination revealed the following data:

DISSEMINATION BY MEANS OF PURVEYING A LITTLE PIECE OR SEVERAL LITTLE PIECES OF TECH (to answer questions, show *how* a person's problem could be handled, show *how* the mind works, etc.) *ENDS* THE CYCLE AND *TERMINATES* THE REACH.

DISSEMINATION BY MEANS OF "COME–ON" STRENGTHENS THE REACH AND LITERALLY PULLS THE PERSON IN.

COME–ON

A thetan is a mystery sandwich. If we tell him there is something to know and don't tell him what it is we will zip people into Div 6 and on into the org.

So in using come-on, one simply does the above. You either have or you create interest in your prospects — then you *channel* them along. Their own curiosity will pull them along the channel, providing you created the correct mystery in the first place.

You channel by indicating where and how *to get* the data — never just GIVE the data. And one can keep on doing this to a person — shuttle them along using mystery. Dept 17 services especially should be geared to this, one service ending in some mystery that only the next Div 6 (or better yet, Div 4) service will solve. One can also put this type of come-on promotion in books one sells so the person buying the book is put into mystery and doesn't just end on a win by reading that one book alone.

END–OFF

Reach gets blunted or terminated once a person gets his question answered, the solution to his problem, etc. Purveying random and little pieces of tech to a prospect and the public at large does just this. This is end-off dissemination.

Thus one should gear one's dissemination to the come-on and keep the prospect's appetite for knowledge and mystery well stimulated and channel the person right along so that he will and does become an actual Scientologist.

In our case, the curiosity restimulated eventually will be fully answered and to the person's complete advantage. When he is given a mere scrap of information, he has been denied the full data, gains and technology which will be his if he attains the benefits of major services.

DEFINITIONS

MYSTERY: the glue which sticks thetans to things. (SHSBC 235, 6211C01)

MYSTERY SANDWICH: 1. the principle of mystery is, of course, this: the only way anybody gets stuck to anything is by a mystery sandwich. A person cannot be connected to his body, but he can have a mystery between him and his body which will connect him. You have to understand this thing about the mystery sandwich. It's two pieces of bread, one of which represents the thetan, one of which represents the body, and the two pieces of bread are pulled together by a mystery. They are kept together by a volition to know the mystery. (PAB 66) 2. a thetan stuck to anything is, of course, just a mystery sandwich. It's thetan, mystery, object — mystery sandwich. (SHSBC 52, 6108C31)

COME–ON: *(noun)* 1. something offered as an inducement. *(Webster's New World Dictionary)* 2. something offered to attract or allure; enticement; inducement. *(World Book Dictionary)*

SUMMARY

Imbue your prospects and the public at large with a thirst to find out.

Mystery, not little scraps of data, will be found to be the biggest puller.

THE BASICS OF MARKETING

There are certain stable data anyone engaged in marketing or preparing the materials for marketing should memorize so that he can think with them. These are not just stable data which one uses to qualify whether or not a marketing thing is okay; these are the stable data which a marketing person, or anyone connected with the development of marketing, uses to create the products related to marketing such as fliers, ads, info sheets, material for salesmen, posters, etc., etc. Memorize the basic data given below and be familiar and able to work with the material contained in parentheses after them so that you can think with these stable data.

0. Be a professional in anything you do.

1. Survey for the public and then survey that public with regard to any product. (HCO PL 2 June 71R, PR Series 10, BREAKTHROUGH, PR AND PRODUCTION, TONE SCALE SURVEYS; HCO PL 1 Jan. 77RA, Marketing Series 3, MARKETING HAT; HCO PL 12 Nov. 69, APPEARANCE AND PRO; HCO PL 13 Aug. 70 II, PR Series 2, THE MISSING INGREDIENT; HCO PL 13 Aug. 70 III, PR Series 3, WRONG PUBLICS; HCO PL 23 Nov. 69 I, INDIVIDUALS VERSUS GROUPS, and any other survey tech.)

2. Do your homework. (Study the market, competitors, field, publics, etc.)

3. Be fully familiar with the propaganda line of PR or public image your company is currently following.

4. Know your product.

5. Establish and use a positioning for every product. (HCO PL 30 Jan. 79, PR Series 28, Marketing Series 5, POSITIONING, PHILOSOPHIC THEORY.)

6. Impinge! (Applies to graphic design, campaign ideas, anything else.)

7. Be alive! (Don't compose dead downgrades.)

8. Direct people's attention. (This applies to graphic design, wording of ads, placement of ads, color choices, ideas, capers and stunts.)

9. Make material aesthetic. (Know how to use geometric design, color wheels, color depth perception, layout, etc.)

10. Be clean, clear-cut, comprehensible. (Don't be complex and muddy.)

11. Use come-on. (In advertising you never tell all you know, just tell people how they can get it or find it.) (See HCO PL 25 June 78, Marketing Series 6, COME–ON DISSEMINATION.)

12. Create want!

MORE ON MARKETING BASICS

The duty of Marketing is to make sure that something gets marketed in such a way that it will be wanted and delivered. To accomplish that one needs to know his marketing basics.

PRODUCT AVAILABILITY

Marketing is supposed to create want and demand, but it is fatal to create want and demand where no delivery is going to occur.

Marketing is also supposed to engage in and result in some sort of exchange. Another way of saying "We deliver what we promise" would be, for marketing purposes, "We promise and promote what we can deliver."

A created demand which then cannot be fulfilled results in ARC breaks with, further, the time, effort and money put into that marketing action down the drain. Also, in such a case, as far as the public goes the credibility of any future marketing done is apt to suffer.

Thus, one markets WHAT IS THERE RIGHT NOW IN EXISTENCE THAT CAN BE DELIVERED. And the marketing of a NEW item must be dovetailed with the actual release and availability of the new item for delivery.

In this way we reap a whirlwind of business, the public gets delivered to and the created demand gets fulfilled.

TWO VITAL MARKETING DATA: REALITY ON THE PRODUCT/REALITY ON THE PUBLIC

There are two important data which must be used in marketing. When these are not applied the result is a marketing piece which does not communicate to the public it was intended for and therefore the promotion is worthless and a waste of money.

These data are:

1. TO GIVE ANY READER REALITY ON AN ITEM, THE COPYWRITER HIMSELF HAS TO HAVE REALITY ON THE ITEM.

2. TO COMMUNICATE TO AN AUDIENCE, YOU HAVE TO HAVE A REALITY ON THE AUDIENCE AS TO WHERE THEY ARE AT AND WHAT THEY ALREADY KNOW OR DON'T KNOW.

Applied, these two data are the basics on which any successful marketing campaign, small or large, is built. If one knows the product and knows his audience, the remainder of the actions necessary to bring the two together become relatively easy.

THE MARKETING CYCLE

Probably some marketing failures result from a false datum that to market is synonymous with directly selling to the customer. That is a wrong concept and woefully incomplete.

Marketing includes all actions from before the beginning of the production right on through to its use by the customer and its word-of-mouth promotion by the public. Your first step is you've got to have a product to market that will market. And you have to groom that product up so you can market it.

From the first moment a product is conceived, much less produced, Marketing has to be in there with surveys to establish the design and use of the product, and it carries on through at every stage to make sure that it will eventually sell and get good word-of-mouth promotion.

Advertising enters into it. The basis of advertising is: You have to *attract,* you have to *interest,* and you can then *get your message across.* It's in that sequence.

Another part of marketing is distribution planning. Without a plan to get the promotion and the product distributed to those points where the promo will be used and the product sold and consumed, you can't market.

And there is one more step in marketing that you have to take, which is the standard step of PR. You have to review your marketing program and your issues and your promo and find out if they were put to use. Did the issues and promo ever arrive? Did the promo ever get printed? Was it actually used? And what was the response to it?

A completed marketing cycle would always include such a follow-up. The success of an existing marketing campaign or the success of the next marketing campaign would depend upon it.

SHOTGUN MARKETING

"Shotgun marketing" is marketing without any concentration on the actual marketing of any one individual product. Pushing everything all at once scatters the audience attention and weakens the impact of the individual items.

Cure yourself of sending all your materials out in a wad as it is a fatal failure. It is only the amateur in PR and marketing who sends out everything he has or has ever heard of in a single shot and thus winds up selling nothing.

On the professional side, one sends materials out piece by piece to arouse and stimulate interest. When interest is stimulated one gets response.

So just don't indulge in shotgun marketing. And don't allow yourself to be talked into it for whatever reason.

Release your materials strategically.

That's part of effective marketing and it's what brings about sales.

As a stable datum, the most attacked and suppressed line in any org or management unit is promo and marketing and one has to know his business to spot it and halt it before it does him in. Were we able to clean out just this one factor in management in every org, we'd have a boom, just like that!

A large part of handling this factor lies simply in both marketing and management terminals *understanding* marketing and its basics. From there it's a fairly short step to getting the marketing basics applied.

That's really all it takes to produce a boom.

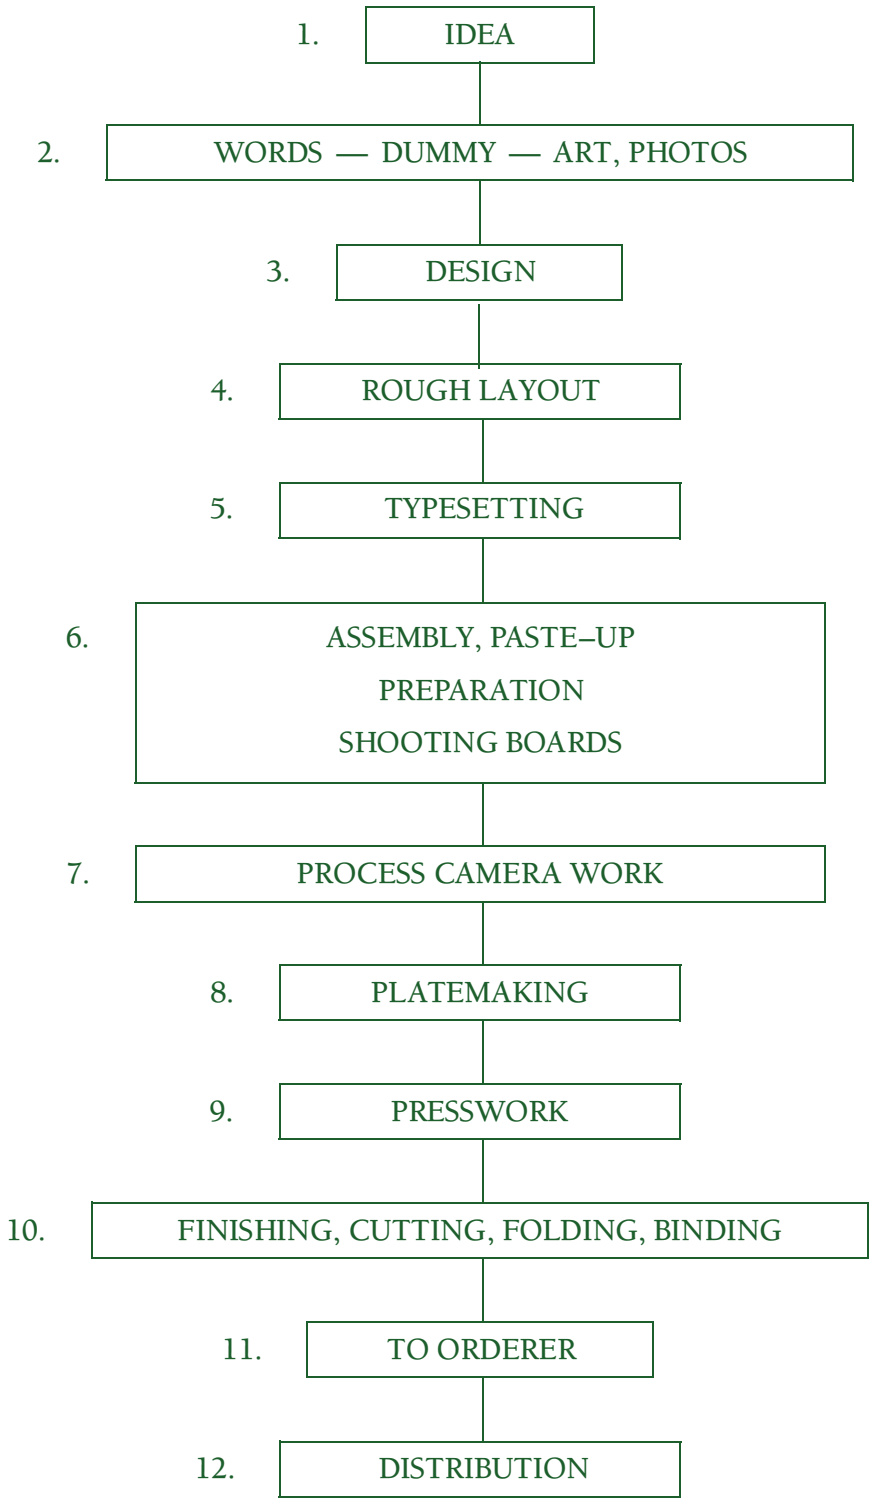
MARKETING SERIES 9

THE ASSEMBLY LINE FOR PRODUCED PROMO

A few years back I found, in a study of the flow lines of promo, that it was very difficult to get a line to move from idea stage to a disseminated piece of promotion.

DESIGN OMISSION

A study of the graphic arts textbooks on layout being used revealed that they began their org boards and flow lines in the print shop! That's several notches down the line in the production of effective promo. Omitted was the vital step of design.



The textbooks were a printer's idea of the world and, being printers, they would not really know much about the source of copy or ideas. The book misdefined "dummy" as "rough layout" and misdefined "rough layout" as *full* design and layout. And that was the text being used. As a result, when requests were made for promo pieces, the reply was, "Well, give us the dummy," and when the dummy came it was, "This isn't the layout."

You *can't* start making columns of printing (galleys) without somebody doing a design and dummy. And you can't do a "rough layout" or any layout at all unless you have a design of what the piece is trying to look like.

But there was no design step. Instead the printer was being asked to put together a "layout" when he hadn't a clue of what the person ordering the piece was trying to present. The result of that could only be hackneyed (trite), bad-looking promo as there was no real design — just type columns and photos.

Design is *quite* a subject; one I happen to know more about than printing, I'm afraid. So to see it omitted in texts explained all. The result, no matter how hard the printer worked, would be apt to be ineffective.

So the flow would read:

You can see that (1), (2) and (3) above are the responsibility of someone outside Dissem — the orderer. And only if originated by Dissem, the responsibility of Dissem.

(12) is also outside Dissem.

Any additional functions of the Dissem Bureau (copywriter, artist, etc.) added to the Bureau come ahead of number one in the assembly line (rough layout) and are not part of the line.

Acceptances (of promo submissions onto the assembly line) require that the submitting person:

1. Used a competent survey.

2. Has written all copy.

3. Has supplied all art and photos or photostats of photos or transparencies required for rough layout and final layout.

4. Has submitted a dummy.

5. Has done a very good and executable design. (The operative word is "EXECUTABLE." A design is not a T-square drawing board matter but is a description of how the piece should look.)

The following definitions permit a flow to occur from idea onward:

IDEA: A concept or notion of something to be done; a plan of action; intention.

DUMMY: A scrap paper expression of the idea. Includes in the same package the written materials or words (called copy), all surveys used, captions, photos and artwork.

DESIGN: The artful format that will *interest* and lead the viewer to involvement in and finally desire to act (to attain, to meet a challenge, to acquire, to achieve, etc.).

ROUGH LAYOUT: The precisely measured pages, spaces, type, croppings, laid out with great mechanical accuracy so that typesetting can begin and separation negatives or blocks that will fit can be made.

TYPESETTING: The act, art or process of setting type for printing.

SHOOTING BOARD LAYOUT: (Includes assembly, paste-up, preparation.) The exact, final arrangement and execution of each page, its type, art and pictures and page arrangement in signatures, ready for the process camera (or in letterpress, the press).

CAMERA WORK: Where plates are made and photos or art plates are made. This has a branch line, in color, which comes just before it, of making color separation negatives.

PLATEMAKING: The process of making a thin, flat piece of metal or plastic called a plate, upon which a picture or a page of type is engraved.

PRESSWORK: This is the actual printing.

NAVIGATE
FIRST PAGE
SEARCH
FIND
AGAIN
EXIT
CONTENTS
ORG BOARDS
INDEX

FINISHING: That which completes or gives a finished appearance to any kind of work. It includes the cutting, collation, folding and binding, stapling or stitching of the printed sheets, to make a finished product.

CUTTING: The trimming or separating of the printed sheets to the specified size.

COLLATION: This is assembly of the printed sheets.

FOLDING: This is doubling or bending the sheets over to the specified form and size, if they are designed to be folded, or if they are to be folded for mailing. It is done by machine or by hand.

STAPLING OR STITCHING: This fastens the sheets together.

BINDING: This fastens the sheets together into a cover (if one is to be used).

PACKAGING: This envelopes or boxes the material.

SHIPPING: This gets the product off to destination.

While many substeps may occur, these are the main steps. Each has its own tech.

If the above steps of dummy, design and rough layout are confused with one another or are tried out of sequence, the final product cannot occur, and if by some bungling does happen, it will be an overt product.

Printers and graphic arts texts hint at a mysterious upper world called "commercial advertising firms." This is as close as they get to mentioning DESIGN as noted above. Graphic arts texts confuse "dummy" and "rough layout." As a result, the industry is in a spin most of the time, as you may have noticed.

The only place the above assembly line backs up is when "rough layout" cannot execute the design due to limitations, inadequate facilities or errors. This requires liaison between these two to iron it all out.

Ignoring or misapplying these flow lines will give you poor promo or, at best, make it hard to get promo out.

The line tangles AT THE TOP THREE POINTS below "idea" unless these are *well understood* and done exactly in this sequence.

If the DESIGN definition is understood and well used, promo will be effective.

HCOB 30 Aug. AD 15R I, Art Series 1, ART and HCOB 29 July 73, Art Series 2, ART, MORE ABOUT, are vital if one is going to do promotion. They regulate the first three steps of this line.

THE RELATIONSHIP BETWEEN DESIGN AND ROUGH LAYOUT

What you're trying to get down the line is a product.

You've got the idea for a promo piece expressed in the dummy and you're trying to take it from *design* (the artful format that will interest and involve the viewer and stimulate him to act) into a precise *rough layout* (the precisely measured parts of the piece laid out with mechanical accuracy).

And right here between these two — design and rough layout — your product could hang up and bog or get hopelessly bungled if the difference between these two actions and their relationship to each other is not fully understood.

DESIGN

The Purpose of Design

To do a rough layout or any layout at all, you must begin with design, and the guiding line there is HCOB 29 July 1973, Art Series 2, ART, MORE ABOUT.

What you're trying to do with the design of a layout throughout is:

A. ATTRACT,

B. INTEREST,

C. DELIVER THE MESSAGE.

If you use the communication formula, you get an extension of this.

Some people abandon art for the message; others abandon any message for what they believe to be art. But if you double it — apply ATTRACT–INTEREST–MESSAGE and the comm formula to the layout as a whole — and then redouble it — apply ATTRACT–INTEREST–MESSAGE and the comm formula to the message itself — you get a double punch of impingement.

You want a design that, in itself, communicates — a design that talks. It requires the use of art forms.

Art Forms— Design Basics

The art forms we're talking about here are shapes or objects.

A keyhole, for example, is an art form. Different shapes, different sizes of keyholes, convey different things. Circles, squares, triangles, etc. — these are all art forms.

There is a simple drill one can do, using art forms, to grasp the basic idea of design. Take ovals, squares, rectangles, circles. Throw down certain shapes on an open page of a brochure on each page and you get a specific design. Is it pleasing? Not pleasing? Dramatic? Not dramatic? What *is* the effect?

Do this again and again, using the various shapes or combinations of them. You can play around with this until you get the full feel of design basics.

Beyond this, one can experiment (but not on the final product!) with different formats, different sizes, horizontals, verticals, different sizes of photos and backgrounds in color or not, textures and two dimensions giving the impression of textures, as well as background designs.

The possibilities are many and one should feel at home with a wide range of them and how they align and integrate, or not, with the rules of standard composition.

Composition and the "Eye Trail"

When we talk about composition, we are talking about how you dispose of the objects in a picture or design, not how you draw one object. Composition is how you arrange or group the objects or shapes.

There are certain stable composition lines and there are dynamic lines. There are various types of mood lines. These must be used. They are part of standard composition, and they have everything to do with design.

In composition you are working not only with the mood of the piece but with the EYE TRAIL. The EYE TRAIL is vital in the layout of a design.

The eye must go somewhere — i.e., start at the top and follow down. *Where* it starts and *where* it goes is called the eye trail. And right here you get into the basic formula of ATTRACT–INTEREST–MESSAGE. The eye trail should lead one — pull one — involuntarily through ATTRACT–INTEREST–MESSAGE.

You can have a design which, by itself, is so irritating that it forbids reading it — it defeats the message. If you don't believe it, look at some pictures in cubism. Cubism is a dead art, by the way. But why did it die? Well, it specialized in irritating pictures, jagged, angry pictures, confused pictures. If the layout is ragged, the eye does not follow down easily.

The actual design will deliver an emotional impact. In other words, your design can be such as to prevent the piece from being read or deliver the wrong emotional impact for that piece, and therefore all the money and the work and all the ideas and all the think that went into it is totally defeated.

Take squares. You put squares in the wrong place and have the eye trail going in the wrong direction and you have an irritated person who will not go further.

Mono-sized shapes or objects or monotone lines — the piece will have no impact and no real eye trail. It's all monotone. It goes nowhere. Or a so-called center spread where the eye is distracted by two other disrelated photos and the attention is dispersed — wrong eye trail.

Thus design, the way you put something together, is very, very able to deliver an emotional impact by itself. Brilliant design will deliver exactly the emotional impact you intend. Brilliant use of the eye trail will carry one to and then through ATTRACT–INTEREST–MESSAGE.

The conclusion, therefore, is that format and layout — the design of the piece — is the key to salability.

So you use the emotional patterns of design and design itself as a means of communicating, to project the desired emotional response.

You're working for the final appearance of the final product when it arrives in somebody's hands.

You're working for a technical quality which all by itself will deliver an impact.

That's DESIGN.

ROUGH LAYOUT

Once the design has been established, rough layout can be done.

Rough Layout precisely measures the pages, precisely measures the spaces within the pages, precisely measures the copy and type that will be used for the copy in the various spaces. It crops, precisely, the photos or other artwork that will be used in the piece.

Cropping

In cropping we see distinctly the relationship between design and rough layout.

There are two types and two stages of cropping:

1. Artistic (design)

2. Mechanical (rough layout)

1. In the design stage you indicate (describe) the artistic on the *design* in the space for the photo. Any crude black-and-white sketch will do.

2. Mechanical — rough layout — makes it fit and marks in the exact dimensions and the crop on the *board* the negative or transparency is in.

Cropping has to do only with format. The actual size of the photograph has nothing to do with the established rules of cropping. It has to do with taste.

Rough Layout follows the design and scales the design to fit in the prescribed space. It does this precisely and accurately *without altering* the design and according to the balances and relationships described by the design.

When we get into rough layout, we are into the graphic arts. (One could get into a confusion here between the terms "graphic arts," "graphics" and "graphic," so it had better be made clear. Roughly, most encyclopedias describe graphic arts as engraving, etching, etc., involving representation or expression by means of lines on flat surfaces. Graphics is described as the art or science of drawing especially by mathematical principles, as in mechanical drawing, or calculating by means of graphs or diagrams. But you look in the dictionary and you find *graphic* means "vivid." So graphic arts and graphics do not mean the same thing as graph*ic*.)

Graphic arts deals with the mechanical reproduction of a picture or design. It is done by means of graph*ing*. You don't use arithmetic in graphic arts. It's more a form of plotting.

They call the rough layout the mechanical, and they call it the mechanical for a good reason — it's MECHANICAL. What's mechanical? That means "by machine."

So in layout you're into the area where it's all machine. We're not talking here about a system of pistons and gears and levers and crankshafts, but we are talking about a mechanical action.

If you've ever been on the bridge of a ship plotting a course, or if you've ever taken arithmetic that gave you vectors whereby you draw one line and then you draw another line and then you measure the length of the second line and that gives you a mathematical solution, you'll see that this is a mathematics of sorts. And that is what is used in graphic arts. But it doesn't have much arithmetic involved in it. It's a system of graphing. You draw a line this way and that intercepts or stops a line over here and then *that* makes a line over here do something. It's plotting, graphing, a machinelike action.

The only way numbers enter into it is that negatives have sizes, paper has a size, prints have a size — and those things have to be accounted for. Your job in rough layout is to make the back wall join with the roof.

From the rough layout you will be able to get the type and you'll be able to get the cropping.

So you do the design in rough layout so that it is totally practical. Rough layout is totally a practical, a mechanical action. "This type will fit here and it fits the design as close as we can get . . ." Etc.

There may be instances where the design as presented cannot be followed exactly by Rough Layout. This can be due to limited equipment or materials or an error in the design or other reasons. When there are legitimate reasons it can't be followed, Rough Layout liaises with Design to get it worked out so that the design can be executed. Otherwise, they are two separate and distinct functions.

The watchword in rough layout is precision. It is done with fine mechanical accuracy so that the preparation of the materials for the shooting boards, the typesetting of the copy, the processing of the separation negatives, etc., can begin. It's all got to be made to fit precisely so that it is doable when it goes to the final shooting board stage.

If it's not mechanically accurate, the shooting boards won't be doable. If it gets to final shooting board stage without it being doable, or to the printer as a faulty shooting board, you won't get a product or you'll get an overt product.

When it gets to the printer and the shooting of the plates, if you are to have two plates, one to follow the other, they've got to be in total, absolute register. There can't be a millimeter of difference. Now we're into precision. But it's precision of what? It's the precision of following what was laid down by Rough Layout. So the rough layout had better be correct.

If it got up to final shooting board stage without the thing being able to be doable, then somebody can't lay out the plate, he can't lay out the printing, the halftone dots won't match, the this won't match, the that won't match, the color separation negatives won't fit in that piece.

The essence of it in the final analysis is, is it doable?

You've taken the design and you've executed it in layout as it's going to be — each part scaled precisely to the right size and mechanically accurate so it all fits together perfectly. It's ready to go onto a shooting board for business so it can then be put under a camera. It's doable.

That's ROUGH LAYOUT.

DISSEMINATION PIECES, STABLE DATUM, APPEARANCE, LAYOUT AND DESIGN

Ref: HCOB 29 July 73 Art Series 2
ART, MORE ABOUT

Executives are often called upon to order or pass upon dissemination materials, magazines, fliers, posters and even books. Staffs are required to do them or bring them into existence.

It is commonly believed that the words or the pictures are all that are of importance. So long as one thinks that way, dissemination pieces will attain only low return or interest.

There is a key datum, a stable datum, which forms the guideline in all such creations or judgments. It is "sort of felt" and in some texts on layout is given some attention. But nowhere has it been forcefully or properly stated.

Therefore this is released as policy as well as guideline and should be used to guide both the creation and authorization of any and every dissemination piece, magazine, flier, poster, advertisement or book:

THE FORMAT, LAYOUT, TYPEFACES (STYLES AND SIZE OF TYPE), PAPER AND COLOR ARE *THEMSELVES* A MESSAGE INDEPENDENT OF THE MEANING OF THE TEXT WORDS OR PICTURE CONTENT AND MUST *THEMSELVES* COMMUNICATE THE MOOD AND THE INTENDED MESSAGE TO BE AN EFFECTIVE FINAL DISSEMINATION PRODUCT. THEY FORM THE CARRIER WAVE ON WHICH THE WRITTEN OR PICTURED MESSAGE TRAVELS. IT IS THESE THINGS BY WHICH THE REALITY OF THE COMMUNICATION IS JUDGED AND ARE THEMSELVES A SIGNIFICANT PORTION OF THE QUALITY OF THE COMMUNICATION.

EFFECTIVE PROMOTION DEPENDS UPON THIS STABLE DATUM AND POLICY BEING UNDERSTOOD.

EFFECTIVE DISSEMINATION PIECES RESULT ONLY WHEN THIS STABLE DATUM IS UNDERSTOOD AND FULLY PRACTICED.

PROMOTION

Refs:
OEC Volume 2 and 6 PLs on ads and promotion

HCO PL	8 Oct. 64	Art Series 12 ARTISTIC PRESENTATION
HCO PL	2 June 65 II	ORG ETHICS AND TECH

Promotion is, of course, an essential part of marketing.

It is the action of making something well known and well thought of.

It is the art of offering what will be responded to.

RESPONSE is the key word here. Whether it's in terms of services sold or commodities sold or communication or goodwill, it's *response* that is the test of all promotion.

In order to get response you've got to first find out what people want. You've got to find out what people consider valuable. When you know what people want and what they consider valuable you know what they will respond to.

It takes surveys. It's no good flying blind or trying to guess at it. You won't KNOW until you survey.

So your first question on all promotion is: "Am I absolutely sure, before I invest any money in this promotion (makeup, printing, postage) that people will consider what I am promoting valuable enough to exchange their hard-won valuables for it?"

The answer lies in the results of your survey. Promotion is always, always, always based on surveys, and it must include the exchange factor.

The real test of good promotion is: Are you getting an effective exchange? The exchange may be communication, it may be goodwill, but — *are you getting exchange?*

Communication and goodwill are valuable in themselves and, as well, they precede and lead to the material exchange of valuable for valuable. So any of these is considered effective exchange in promotion.

One must, however, in order to continue to survive and to continue to promote, arrive very shortly at a material exchange of valuable for valuable — a consumption of the product one is promoting. On a material exchange basis, if you are trying to produce something and nobody is busy absorbing or consuming it, you are in trouble right away because nobody is going to support you, and that's where your income is. So the final value of promotion and where you get the money to do the promotion is in the CONSUMPTION of the thing you're promoting.

The important datum here is: YOU PROMOTE WHAT CAN BE DELIVERED AND CONSUMED.

Make it a firm policy that you push what you have ready to put in public hands at the time of the promotion and that you do not heavily promote future products not yet in hand.

Then, in any promo piece, be it an ad, brochure, a flier, a pamphlet, a poster — you follow the line of:

1. Attract,

2. Interest,

3. Get your message across.

That sequence, followed, can look many different ways in many different promo pieces depending upon the subject, the mood, the design and the copy of the piece. But in any successful promotion the basic sequence will be found to be just that: Attract–Interest–Message.

TWO GUIDING RULES

There are two guiding rules to be followed in any type of promotion:

1. Don't soft sell.

2. Don't set us up for false claims.

The results of Dianetics and Scientology are fantastic enough to please all but the most psychotic in the society. These results have never before been seen on the planet. But there are always SPs out there who don't want people to get well and who use literature to get you in trouble.

The art of hard sell is you tell people to do something. Hard sell is based on knowing and promoting in the line of truth and not being reasonable about people who want "other things" and "other practices." There is nothing to compare with Dianetics and Scientology. They are infinitely valuable and transcend time itself.

So don't understate things in your promotion. Just tell the truth and you'll find that it's very effective.

QUALITY DEGRADES

A degrade of the quality of something means an action that lowers or reduces its excellence or degree of excellence.

CONTENTS
ORG BOARDS
INDEX

In promotion, a quality degrade would be a poorly designed piece or a sloppy printing job or dull, cliché-ridden or otherwise inappropriate copy or any other of a number of carelessly done or not done actions that would show up in the final result.

Quality degrades can be caused by:

a. willful unhattedness, or

b. lack of good taste or a sense of the fitness of things, or

c. knowing products or promotion are of poor quality but, for one reason or another, neglecting to remedy them or call them to the attention of those who can and will remedy them.

There is no excuse, with all of the tech at our disposal, for any of the above.

The standards for the quality of our promotion must be high and must be maintained. We are not playing children's games. This is your show and your planet too. You aren't doing this just for me — but I am sure you know that.

We have an incomparable technology. In order to get it delivered we MUST communicate and in the communication we MUST interest people in order to be seen and listened to.

A quality degrade in promotion cuts our comm lines to a greater or lesser degree. And the world depends in no small measure on our comm lines.

Thus, quality degrades are no slight matter. They cut our comm lines because, with dropped-out quality, what we make and the promotion of what we make would be so flawed that it would not communicate.

So realize, when promoting, that the world needs us and our technology. Make it well known and well thought of.

And keep the quality of your promotion such that it does attract and interest and communicate and bring *response*.
